their hands. There is no recognized singles game. When the game starts, the server alone stands in the upper court. To begin the game he throws the ball so that it hits the front wall and then the right-hand sidewall and falls to the lower court.

The opponent who returns the service is said to make the "first cut," and he need not do so until he gets a service to his liking. Serving is only a method of putting the ball in play. The ball must be hit with a single blow of the hand or wrist and must not touch any other part of the striker's person.

After the first cut, the ball is played alternately by a player of each side. Providing the ball is played not later than after the first bound on the floor and is returned above the line, the rally continues.

A game is won by the side that first obtains 12 points. When the server's side wins a rally, a point is won; if the server's side loses a rally, the server's partner serves and no point is scored; if the server's side loses another rally, the service changes to the opponents. A point can only be won if the winners of the rally are the serving side. A match is usually the best of five games.

Governed by the Eton Fives Association, the main competitions are for an amateur championship and a public schools competition.

For the uninitiated spectator, the game is bewildering. The ball rebounds in many unexpected ways off the hazards, and the players seem often to be in each other's way. It involves mental as well as physical exercise, there being a variety of ways to outwit an opponent.

Rugby *fives*. The Rugby *fives* court has four plain composition walls and a hard composition floor. The front wall has a board running across its lower portion. The sidewalls decrease in height from the front wall, sloping down from 15 feet (about 4.8 m) to 6 feet (about 1.8 m), the height of the back wall.

The game is played like Eton *fives* with the exception that the player who makes the first return is called the server. Either he can throw the ball up for himself, and usually does, or he can require his opponent, called the receiver, to do so. The ball must be hit only with the hand or forearm. The receiver is "up," and only a side that is "up" can score points. Matches are usually the best of three games, the first team or player to get 15 points winning the game. Club and school games are won on total points. Both singles and doubles are played.

Competition, regulated by the Rugby Fives Association, includes several regional championships, a universities championship, amateur singles and doubles championships, and schools championships. Rugby *fives* can be exhausting because of the speed of the ball, the low board, and the use that is made of the back wall. It is the most popular of the three games.

Winchester *fives*. Winchester *fives* is a game confined to a few schools, there being no association or championships and few courts. The court is similar to the Rugby one, but a change of direction of the left-hand wall makes the court slightly narrower at the back than at the front. This changes the positioning of players, and Rugby *fives* players are at a disadvantage. Despite these differences, Winchester players have little difficulty in adapting to the Rugby game, and several schools that play the Winchester game are affiliated with the Rugby Fives Association.

Fizeau, Armand-Hippolyte-Louis (b. Sept. 23, 1819, Paris—d. Sept. 18, 1896, Nanteuil-Haudouin, Fr.), French physicist noted for his experimental determination of the speed of light.

Fizeau worked with Jean-Bernard-Léon Foucault on investigations of the infrared portion

of the solar spectrum and made other observations of heat and light. Unaware of Christian Doppler's publication (1842), Fizeau in 1848 gave an explanation of the shift in wavelength in light coming from a star and showed how it could be used to measure the relative velocities of stars that lie in the same line of sight. In 1849 Fizeau found the first reasonably accurate value of the velocity of light obtained in a nonastronomical experiment.

In 1851 he carried out a series of experiments in an attempt to detect the luminiferous ether—a hypothetical material that was thought to occupy all of space and to be necessary for carrying the vibrations of light waves. The experimental results failed to demonstrate the existence of the ether, but his work helped lead to the discarding of the ether theory in the early years of the 20th century.

Fizeau became a member of the French Academy in 1860 and was appointed superintendent of physics at the École Polytechnique, Paris, in 1863.

A list of the abbreviations used in the MICROPEDIA will be found at the end of this volume

fjord, also spelled **FIORD**, long narrow arm of the sea, commonly extending far inland, that results from marine inundation of a glaciated valley. Many fjords are astonishingly deep; Sognefjord in Norway is 1,234 m (4,078 feet)

Bradshaw Sound, Fiordland, west coast of South Island, New Zealand

deep, and Canal Messier in Chile is 1,270 m (4,167 feet). The great depth of these submerged valleys, extending thousands of feet below sea level, is compatible only with a glacial origin. It is assumed that the enormous, thick glaciers that formed in these valleys were so heavy that they could erode the bottom of the valley far below sea level before they floated in the ocean water. After the glaciers melted, the waters of the sea invaded the valleys.

Fjords commonly are deeper in their middle and upper reaches than at the seaward end. This results from the greater erosive power of the glaciers closer to their source, where they are moving most actively and vigorously. Because of the comparatively shallow thresholds of fjords, the bottoms of many have stagnant water and are rich in black mud containing hydrogen sulfide.

Glacial erosion produces U-shaped valleys, and fjords are characteristically so shaped. Because the lower (and more horizontally inclined) part of the U is far underwater, the visible walls of fjords may rise vertically for hundreds of feet from the water's edge, and close to the shore the water may be many hundreds of feet deep. In some fjords small streams plunge hundreds of feet over the edge of the fjord; some of the world's highest water-

falls are of this type. Fjords commonly have winding channels and occasional sharp corners. In many cases the valley, floored with glacial debris, extends inland into the mountains; sometimes a small glacier remains at the valley's head. The river that formed the original valley commonly reestablishes itself on the upper valley floor after the disappearance of the ice and begins to build a delta at the fjord's head. Often this delta is the only place on the fjord where villages and farms can be established.

Flacius Illyricus, Matthias, Serbo-Croatian MATIJA VLAČIĆ ILIR (b. March 3, 1520, Albona, republic of Venice [now Labin, Croatia])—d. March 11, 1575, Frankfurt am Main), Lutheran Reformer, pioneer in church historical studies, and theological controversialist who created a lasting rift within Lutheranism.

From 1539, after studies in Venice with the humanist Baptista Egnatius, Flacius attended the universities of Basel, Tübingen, and Wittenberg. He was welcomed at Wittenberg in 1541 by Philipp Melancthon and there came under Martin Luther's influence. Appointed professor of Hebrew at Wittenberg in 1544, Flacius incurred Melancthon's wrath for opposing the Augsburg Interim (1548) and the Leipzig Interim (1548), which formulated basic Lutheran beliefs. In 1549 he moved to Magdeburg, where his dispute with Melancthon was resolved.

From 1552 Flacius was occupied with the *Ecclēsiastica historia*, his major work in church history. Completed in 1574 and called the *Centuriae Magdeburgenses* ("Magdeburg Centuries") from its third edition (1757), it treats the centuries of church history mechanically as discrete units. Under his supervision it was prepared from manuscripts collected from all accessible European libraries by a group known as the centuriators. Frequently polemical, its intent was to refute Roman Catholic claims to authenticity.

Made professor of the New Testament at the University of Jena in 1557, Flacius was soon involved in a new controversy with Melancthon over adiaphorism, which holds

that certain religious doctrines or practices are matters of indifference because they are neither commanded nor forbidden in the Bible. Melancthon took the more liberal position that some features of Reformation theology were comparatively minor and therefore open to compromise, but Flacius maintained a strict view of Luther's beliefs and refused to yield to negotiation on any point. Following a series of personal attacks on Melancthon, Flacius was removed from his post at Jena in 1561 and lived successively in Regensburg, Antwerp, Frankfurt, Strassburg, and again in Frankfurt.

Among other works by Flacius are *Clavis scripturae sacrae* (1566; "Key to Sacred Scripture"); his version (1555) of Luther's writings; and the "Book of Confutation" (1559), in which he detailed his position in the adiaphorist controversy.

Flacourtiaceae, the Indian plum family, belonging to the violet order (Violales) and comprising about 85 genera of widely distributed tropical and subtropical trees and shrubs. Various species yield edible fruit or commercially useful wood.

The ramontchi, batoko plum, or governor's plum (*Flacourtia indica* or *F. ramontchi*), native to Southeast Asia and East Africa and commonly cultivated in warm regions of the United States, bears a dark red, astringent fruit, about 12 mm (about 0.5 inch) in diameter, that is of some medicinal use. The tree also yields a wood suitable for tool handles. Other members of the genus *Flacourtia* bear similar fruit. The wood of the wild peach (*Kiggelaria africana*), native to southern Africa, is used for furniture. The kei apple (*Dovyalis caffra*), native to southern Africa, is grown as a hedge and for its fruit, which is pickled or used in preserves. The bright yellow fruit is about 2.5 cm (1 inch) in diameter.

flag, a piece of cloth, bunting, or similar material displaying the insignia of a community, an armed force, an office, or an individual. A flag is usually, but not always, oblong and is attached by one edge to a staff or halyard. The part nearest the staff is called the hoist; the outer part is called the fly. A flag's length (also called the fly) usually exceeds its width (hoist). Flags of various forms and purpose are known as colours, standards, banners, ensigns, pendants (or pennants), pennons, guidons, and burgees.

Originally used mainly in warfare, flags were, and to some extent remain, insignia of leadership, serving for the identification of friend or foe and as rallying points. They are now also extensively employed for signaling, for decoration, and for display. Because the usefulness of a flag for purposes of identification

depends on its blowing out freely in the wind, the material that is preferred is usually light and bears a device or pattern identical on both sides. Wording therefore tends to be excluded, and the simpler patterns are favoured. Any colours or devices may be used, but European usage normally follows the practice of heraldry in discouraging the juxtaposition of "metal" and "metal" (i.e., of yellow and white) or of colour and colour without "metal" interposed. The flag of the Vatican City state constitutes an exception to this rule.

Origins. Flags recognizable as such were the invention, almost certainly, of the ancient Indians or the Chinese. It is said that the founder of the Chou dynasty in China (c. 1122 BC) had a white flag carried before him, and it is known that in AD 660 a minor prince was punished for failing to lower his standard before his superior. Chinese flags had devices such as a red bird, a white tiger, or a blue dragon. They were carried on chariots and planted upon the walls of captured cities. The royal flag had, however, all the attributes of kingship, being identified with the ruler himself and treated with a similar respect. It was thus a crime even to touch the flag-bearer. The fall of the flag meant defeat; and the king would rarely expose his flag and his person together, the flag being normally entrusted to a general.

Flags had equal importance in ancient India, being carried on chariots and elephants. The flag was the first object of attack in battle, and its fall would mean confusion if not defeat. Indian flags were often triangular in shape and scarlet or green in colour, with a figure embroidered in gold and a gold fringe. If these and the Chinese flags had a common origin in the standards of ancient Egypt and Assyria (standards, in this sense, meaning solid objects, such as metal animals, attached atop poles), then they might have developed from the streamers often attached to the pole. This possibility gains some likelihood from the fact that some Indian flagstaves were surmounted by a figure similar to that displayed on the flag itself. Mughal royal insignia included, however, other things besides the flag, more especially yaks' tails and the state umbrella. Flags seem also to have been used, in India as in China, for signaling, and there is an instance of a white flag being used as a signal for a truce as early as AD 1542. Indian and Chinese usage spread to Burma, Siam, and southeastern Asia. Flags with a background of white, yellow, or black silk are mentioned, with devices (an elephant, a bull, or a water hen, for example) embroidered on them

in gold. A Siamese treatise on war gives the impression that the flags were unfurled as the march began.

Flags were probably transmitted to Europe by the Saracens. But Islām's prohibition of the use of any identifiable image as idolatrous influenced their design. They are often mentioned in the early history of Islām and may have been copied from India. But Islāmic flags are greatly simplified and appear to have been plain black or white or red. Black was supposed to have been the colour of Muḥammad's banner—the colour of vengeance. A black flag was used by the 'Abbāsids in AD 746 (AH 129), the Umayyads choosing white by contrast and the Khawārij red. Green was the colour of the Fātimid dynasty and eventually became the colour of Islām. In adopting the crescent sign, however, about 1250, the Ottoman Turks apparently were reverting to an Assyrian sacred symbol of the 9th century BC and probably of greater antiquity than that. The crescent moon, with or without an additional star or stars, has since become the accepted official symbol of Islām.

In Europe the first "national" flags were adopted in the Middle Ages and the Renaissance. Many of the leaders of that time adopted the flag of their patron saint to represent their country. In England, for example, the cross of St. George was adopted in the 13th century. Toward the end of the Middle Ages, flags had become accepted symbols of nations, kings, organizations, cities, and guilds. Guild flags bore obvious devices. For instance, a black flag with three white candles represented the candlemakers of Bayeux, Fr.

Forms and functions. In Europe, flags were subdivided according to their shape and purpose into standards, banners, guidons, pennons, and streamers. There were also many flags of a personal, family, or local significance that were of a different, and usually more complex, pattern. Of the main types, the standard was the largest and was intended, from its size, to be stationary. It marked the position of an important individual before a battle, during a siege, throughout a ceremony, or at a tournament. For the monarch it marked the palace, castle, saluting base, tent, or ship where he was actually present. Standards were also used at first by the greater nobles, whose personal insignia they bore. They were originally long and tapering toward the fly, ending in two points. Banners were square or oblong and were borne in action (as the standard was not) before royal and noble warriors down to the rank of knight banneret. These again bore the personal or family device. The guidon (a word derived from the French *guyd-homme*) was similar to the standard but was rounded in the fly or had two swallow tails, both rounded. Guidons were borne by leaders in battle who were of no more than knightly rank and so not entitled to display a banner. The pennon, a small triangular flag, was carried by each knight on his lance. One purpose of the pennon was to obviate accidents in much the same way as does a red flag tied to a long pole or rod that extends beyond the tail-board of a truck. But the pennon served also to strike terror into the enemy and to denote rank. The streamer (now known as a pendant, or pennant) was a long, tapering flag from 60 to 18 feet (18 to 5.5 m) long and about 24 feet (7 m) broad at the hoist, ending in two points. Because of its great length, almost its only use was at sea. In the 15th century it was flown from a pole rising above the fighting top, and later from the yardarm or topmast. It came eventually to distinguish the warship from the merchantman and, more specifically, the warship in commission from the warship laid up in harbour. The pennant is white in the British Royal Navy, with a St. George's

cross near the hoist, and denotes a warship in commission, being hoisted when the captain assumes his command.

The flag, over the centuries, has developed many special uses. The black flag in days gone by was the symbol of the pirate. All over the world a yellow flag is the signal of infectious illness. A ship hoists it to denote that there are some on board suffering from yellow fever, cholera, or some such infectious malady; and it remains hoisted until the ship has passed quarantine. This flag is also hoisted on quarantine stations. The white flag is universally used as a flag of truce.

At sea, striking, or lowering, the flag denotes surrender. When the flag of one country is placed above that of another, the victory of the former is denoted; hence, in time of peace it would be an insult to hoist the flag of one friendly nation above that of another. Each national flag must be flown from its own flagstaff. To denote honour and respect, a flag is "dipped." Ships at sea salute each other by "dipping," *i.e.* by running the flag slowly down from the masthead and then smartly replacing it. When troops parade before a sovereign or other reviewing officer, the regimental flags are lowered as they salute him. A flag flying at halfmast is the universal symbol of mourning. A ship's signal of distress is made by hoisting the national ensign reversed, *i.e.*, upside down.

National flags. The colours and designs of national flags are usually not arbitrarily selected but rather stem from the history, culture, or religion of the particular country. Many flags can be traced to a common origin, and such "flag families" are often linked both by common traditions and by geography. The oldest European flags still in use are those that display the Christian cross, which was first extensively used in the Crusades. In addition to the British flag, the Union Jack (*q.v.*), flags with crosses are used by Norway, Sweden, Finland, Denmark, Greece, and Switzerland. Following the introduction of heraldry into Europe in the 12th and 13th centuries, European royalty adopted coats of arms that soon became the basis of their flags. These heraldic devices have largely disappeared from modern national flags, but the colours used in the coats of arms are still the colours of the flags of Poland, Belgium, Germany, Spain, Hungary, Luxembourg, and Monaco. The flags of Austria and the tiny states of San Marino and Liechtenstein still display the heraldic devices themselves.

Among the better known of Europe's striped flags was the red-white-blue flag of the Netherlands. Because of its use in that country's long war for independence from Spain, the flag and its colours became associated with the concepts of liberty and a republican form of government. This association was greatly reinforced by France's adoption of the same colours, but with vertical instead of horizontal stripes, following the French Revolution of 1789. The newly independent United States' choice of these colours for the Stars and Stripes (*q.v.*), however, was based on its former affiliation with Britain and the colours of the Union Jack. Other nations in Europe and in South and Central America selected tricolours of their own to express their adherence to the principles of liberty, equality, and fraternity as embodied in the French flag. The flag of the former Soviet Union was red with a yellow hammer and sickle, the traditional symbol of revolution for communists. China also adopted a red flag on the basis of that colour's communist associations.

In the Middle East the predominance of Islām has generally limited the choice of flag colours to the four traditional Muslim colours of red, white, green, and black. The flags of most Arab states use one or several of these colours in a tricolour format, although the star and crescent motif is present in the flags of

Turkey, Algeria, and Tunisia. Other primarily Muslim countries, such as Pakistan and Malaysia, also use the star and crescent as a sign of their Islāmic faith. Almost all the flags of the sub-Saharan African nations were created in the late 1950s and '60s and bear strong family resemblances to one another. The two major categories are flags of member states of the British Commonwealth and those of nations formerly under French colonial control. The flags of the former French colonies tend to have vertical tricolours and are generally green-yellow-red, while the flags of the Commonwealth members have horizontal tricolours and often include green, blue, black, and white.

The flags of the countries of Asia present a remarkable diversity that is due largely to the development of distinctive national symbols before the era of European colonization. The one general pattern that may be noted is the use of a religious or political symbol against a background of a solid colour. There are flags featuring the Sun (Japan, Nepal, Taiwan), a wheel (India), the yin-yang symbol (South Korea, Mongolia), a dragon (Bhutan), and a sword (Sri Lanka). Australia and New Zealand use modified versions of a type of British flag, the blue ensign.

In the Western Hemisphere, Canada uses a maple leaf as a distinctive emblem of the nation. The former political union of five of the countries of Central America is commemorated by their retention of the old blue-white-blue Central American flag, which has been modified by each particular country. The common historical heritage of Venezuela, Colombia, and Ecuador is shown by the almost identical yellow-blue-red tricolour flags they use. Some other South American countries were influenced in their choice of flags by those of the United States or France.

Since World War II interest in flags has expanded beyond their creation and use. Political scientists, historians, sociologists, and others recognize them as artifacts expressive of the cultures of certain times and places. The scholarly study of the history, symbolism, etiquette, design, manufacture, and other aspects of flags is known as vexillology (from the Latin *vexillum*, "banner"). Such studies are fostered by many publications as well as by the International Federation of Vexillological Associations and its members.

flagbird, any of the six-plumed birds-of-paradise. *See* bird-of-paradise.

flagellate (subphylum Mastigophora), any of a group of protozoans, mostly uninucleate organisms, that possess, at some time in the life cycle, one to many flagella for locomotion and sensation. (A flagellum is a hairlike structure capable of whiplike lashing movements that furnish locomotion.) Many flagellates have a thin, firm pellicle (outer covering) or a coating of a jellylike substance. Reproduction is either asexual (usually by longitudinal splitting) or sexual. The flagellates are divided taxonomically into two classes, those resembling plants, Phytomastigophorea (*see* phytoflagellate), and those resembling animals, Zoomastigophorea (*see* zooflagellate).

The Phytomastigophorea includes chlorophyll-containing protozoans that can produce their food photosynthetically, as do plants—*e.g.*, *Euglena* and dinoflagellates. Distinctions between phytoflagellates and algae are obscure; some phytoflagellates are placed with algae in some botanical classifications.

Members of the class Zoomastigophorea are colourless, animal-like protozoans—*e.g.*, symbiotic hypermastigids. Zooflagellate species in the digestive tracts of termites and roaches enable these insects to utilize the nutrients in cellulose.

Flagellates may be solitary, colonial (*Volvox*), free-living (*Euglena*), or parasitic (the disease-causing *Trypanosoma*). Parasitic forms

live in the intestine or bloodstream of the host. Many other flagellates (dinoflagellates) live as plankton in both salt and fresh water.

flagellation, in religion, the disciplinary or devotional practice of beating with whips. Many theories have been offered to explain the phenomenon. It has been interpreted as a driving out of evil spirits, as purification, as a form of sadism, and as an incorporation of the animal power residing in the whip, but none of these hypotheses encompasses the whole range of the custom.

In antiquity and among primitive peoples, ceremonial whippings or beatings were primarily concerned with rites of initiation, purification, and fertility, which often included other forms of physical suffering. Floggings and mutilations might or might not be self-inflicted. Beatings administered by masked impersonators of gods or ancestors are a feature of many North American Indian initiations. Ritual floggings are also known from classical antiquity among the Spartans and in Rome.

In the primitive Christian church flagellation apparently was used as punishment for disobedient clergy. From the 4th century, self-inflicted flagellation was practiced by both clergy and laity as the most efficacious means of penance. In the early European Middle Ages the laity became especially attracted by this devotional exercise. In the mid-13th century flagellant brotherhoods and processions composed of laymen and women, as well as clergy, began to be organized in Italy, and the practice spread into Germany and the Low Countries.

In the mid-14th century people were fearful because of the plague, and from this crisis flagellation arose; the flagellants were seeking by their own efforts to mitigate the divine judgment that was felt to be at hand. They formed groups and traveled about the country on foot. In two daily public ceremonies men whipped their backs and chests with leather thongs, while women chastised themselves in seclusion. The flagellants' piety, fears, and hopes were expressed in processional hymns, fragments of which are preserved in the hymnbooks of later generations. A definite part of their ritual was the reading of a letter that proclaimed flagellation—not the ecclesiastical sacrament of penance—to be the only way to salvation. In 1349 Pope Clement VI condemned flagellation, as did the Council of Constance (1414–18).

In Germany the flagellants became an organized sect and were a target of the Inquisition. The practice gradually subsided, but in the 16th century the Jesuits temporarily revived lay interest in self-inflicted flagellation, especially in the southern European countries.

Flagellation is also practiced by some Shi'ite Muslims, who whip themselves on the holiday of 'Ashūrah' to commemorate the martyrdom of Ḥusayn at the Battle of Karbalā' (AD 680).

flagellum, plural FLAGELLA, or FLAGELLUMS, hairlike structure that acts primarily as an organelle of locomotion in the cells of many living organisms. Flagella, characteristic of the protozoan group Mastigophora, also occur on the gametes of algae, fungi, mosses, and slime molds. Flagellar motion causes water currents necessary for respiration and circulation in sponges and coelenterates. Most motile bacteria move by means of flagella.

The structures and pattern of movement of prokaryotic and eukaryotic flagella are different. Eukaryotes have one to many flagella, which move in a characteristic whiplike manner. The flagella closely resemble the cilium (*q.v.*) in structure. The core is a bundle of nine pairs of fibres (microtubules) surrounding 2 central pair of fibres (the so-called nine-plus-two arrangement); each microtubule is composed of the protein tubulin. The coordinated sliding of these microtubules confers move-

The bacterium *Proteus vulgaris* (greatly magnified) showing flagella

© Lee D. Simon—Photo Researchers

ment. The base of the flagellum is anchored to the cell by a small basal body (kinetosome).

Bacterial flagella are helically shaped structures containing the protein flagellin. The base of the flagellum (the hook) near the cell surface is attached to the basal body enclosed in the cell envelope. The flagellum rotates in a clockwise or counterclockwise direction, in a motion similar to that of a propeller.

The movement of eukaryotic flagella probably depends on adenosine triphosphate (ATP) for energy, while that of the prokaryotes probably derives its energy from the proton-motive force, or ion gradient, across the cell membrane.

flageolet (from Old French *flageol*: "pipe," or "tabor pipe"), wind instrument closely related to the recorder. Like the recorder it is a fipple, or whistle, flute—*i.e.*, one sounded by

Single (at left) and double flageolets; in the Museum of Fine Arts, Boston

Lester Lindsey Mason Collection of Musical Instruments (formerly the Galpin Collection), Museum of Fine Arts, Boston

a stream of breath directed through a duct to strike the sharp edge of a hole cut in the side of the pipe. The name flageolet was applied to such flutes at least from the 13th century, but from the late 16th century it has referred most specifically to a form of the instrument developed at that time in Paris. Its principal, or French, form has a contracting bore with four front finger holes and two back thumb-holes. From the mid-18th century the beaked mouthpiece formerly used was replaced by a narrow tube of bone or ivory that led to a chamber maintaining steady air pressure and holding a sponge to absorb breath moisture.

A popular amateur instrument, it also occupied in the 18th-century orchestra (as the *flauto piccolo*) the role now held by the modern piccolo. With keywork added it became the popular quadrille flageolet of the mid-19th century, made famous by the virtuoso Collinet. The English flageolet is a late 18th-

century adaptation of the French form, with six front finger holes and, sometimes, keywork. Flageolets were often built as double pipes (the English also as triple pipes), all with a single mouthpiece.

The flageolet's compass varied but, in the 19th century, was typically from the second G above middle C to the fourth A above and was notated a 12th below. "Flageolet" sometimes refers generically to any fipple flute.

Flaget, Benedict Joseph (b. Nov. 7, 1763, Contournat, Fr.—d. Feb. 11, 1850, Louisville, Ky., U.S.), an influential figure in the development of the Roman Catholic church in the United States.

Flaget entered the Sulpician Society, was ordained in 1786/87, and taught theology. He was one of several Sulpicians sent in 1792 to establish the first Roman Catholic seminary in the United States. During the next 17 years he served as missionary to Vincennes, Ind.

Bishop John Carroll's diocese of the United States was divided in 1808, and he consecrated Flaget (Nov. 4, 1810) as bishop of Bardstown, Ky.; his diocese extended from Kentucky to the Great Lakes, from the Alleghenies to the Mississippi. Flaget became highly influential in the councils of the U.S. church, and his various religious establishments included St. Thomas Seminary (1812), the Sisters of Loretto and the Sisters of Charity of Nazareth (1812) for the elementary education of girls, and St. Joseph and St. Mary's boys' colleges. He visited Rome in 1835 and, at the request of Pope Gregory XVI, toured France (1837–39). He retired (1848) to ascetic solitude. The sec, at his request, was moved to Louisville, where he is entombed in the Cathedral of the Assumption.

Flagg, James Montgomery (b. June 18, 1877, Pelham Manor, N.Y., U.S.—d. May 27, 1960, New York, N.Y.), American illustrator, poster artist, and portrait painter known for his illustrations of buxom girls and particularly for his World War I recruiting poster of a pointing Uncle Sam with the caption "I Want You" (*see* Uncle Sam). The poster was reissued during World War II.

At the age of 12, Flagg sold his first drawing to the children's magazine *St. Nicholas*; after 1892 he was a regular contributor to other popular periodicals, and his illustrations were collected into books. His dashing line and sure draftsmanship were evident in his portraits in oil and watercolour, the only "serious" art he practiced. Flagg was known to the public mainly through his commercial art. In his autobiography, *Roses and Buckshot* (1946), Flagg represented himself as a bohemian, unfettered by convention.

Flagler, Henry M(orrison) (b. Jan. 2, 1830, Hopewell, N.Y., U.S.—d. May 20, 1913, West Palm Beach, Fla.), U.S. financier and partner of John D. Rockefeller, Sr., in establishing the Standard Oil Company; he pioneered in

Flagler

By courtesy of the Library of Congress, Washington D.C.

the development of Florida as a U.S. vacation centre.

Around 1850 Flagler became a grain merchant in Bellevue, Ohio, where he met Rockefeller and sold grain through him. With \$50,000 capital, Flagler made an unsuccessful attempt to manufacture salt in Michigan and returned to Cleveland, where in 1867 he joined Rockefeller in an oil company that became Standard Oil in 1870. Active in the development of that corporation, he served as director of Standard Oil of New Jersey until 1911.

In 1883 Flagler visited Florida and three years later purchased several railway lines that he combined as the Florida East Coast Railway. During the 1890s he built a chain of luxury hotels along the rail line as well as in Nassau, in the Bahama Islands. He also dredged Miami harbour and established steamship lines to Key West and Nassau.

Flagstad, Kirsten (b. July 12, 1895, Hamar, Nor.—d. Dec. 7, 1962, Oslo), greatest Wagnerian soprano of the mid-20th century.

Flagstad came from a family of professional musicians and studied singing in Oslo, where, after her operatic debut there in 1913, she

Kirsten Flagstad
Suddeutscher Verlag

worked principally as a light soprano, singing oratorio, opera, and operetta. In 1928 she joined the Storm Theatre in Göteborg, Swed., and added further operatic roles to her repertoire.

In 1932, after a period of retirement following her second marriage, she found that her voice had become heavy enough to undertake Wagner's *Tristan und Isolde*. In 1933 and 1934 she sang small roles at Bayreuth, and in 1935 she made her debut at the Metropolitan Opera in New York City as Sieglinde in *Die Walküre*. A year later she appeared at Covent Garden, London, as Isolde. In this role and as Brünnhilde in Wagner's *Ring* cycle her greatness was at once realized. The outbreak of World War II found her in the United States; she returned to Norway in 1941 to join her husband, who was later imprisoned for his associations with the Norwegian traitor Vidkun Quisling. She was exonerated of any offense by a Norwegian court and after her husband's death returned to the United States and England. From 1948 to 1951 she sang at Covent Garden. In 1953 she retired from public singing, but continued to broadcast and make phonograph records. She was the first director of the Royal Norwegian Opera (1958–60).

Besides the great Wagnerian roles, she made memorable appearances in Gluck's *Alceste*, in Beethoven's *Fidelio*, and in Purcell's *Dido and Aeneas*.

Flagstaff, city, seat (1891) of Coconino county, north central Arizona, U.S. The three San Francisco Peaks are immediately north of the city, which is encircled by the Coconino National Forest. Lumberjacks celebrating the 4th of July, 1876, nailed a U.S. flag to the

Northern Arizona University, Flagstaff, Ariz.
Markow Photography

top of a tall ponderosa pine and called the unnamed settlement Flagstaff. In 1882 the Atlantic and Pacific Railroad (now the Santa Fe) arrived and assured the community's growth. A timber-based economy still prevails, but the tourist industry, augmented by the area's scientific developments and the proximity of Glen Canyon Dam, are added economic assets. Nearby are the Arizona Snow Bowl (winter ski resort), Meteor Crater (used as a training ground for astronauts), Painted Desert, Sunset Crater National Monument, Grand Canyon National Park, and major Indian ruins. The city is an astronomical centre with the Perkins and U.S. Naval observatories, and Lowell Observatory, which is used for lunar mapping. It is the site of Northern Arizona University (1966; founded 1899 as Northern Arizona Normal School), and the Museum of Northern Arizona (1928). Inc. 1928. Pop. (1990) 45,857.

Flahaut de la Billarderie, Auguste(-Charles-Joseph), comte de (count of) (b. April 21, 1785, Paris—d. Sept. 1, 1870, Paris), French army officer and diplomat, better remembered for his exploits in love affairs than for his public service.

At the time of his birth, his mother, Adèle Filleul, was the wife of the Comte de Flahaut, but Charles was generally recognized to be the offspring of her liaison with Talleyrand. During the Revolution, in 1792, his mother took him into exile, and they remained abroad until 1798.

He entered the Army in 1800 and received his commission after the Battle of Marengo. He became aide-de-camp to Joachim Murat (and the lover of Murat's wife, Caroline, Napoleon's sister) and was wounded at Enns, in Austria, in 1805. In Warsaw he met Anna Poniatowska, Countess Potocka, who became his mistress. He served in Portugal (1807), in Spain (1808), and then in Germany. Meanwhile, Countess Potocka had established herself in Paris, but Flahaut was now the lover of Napoleon's daughter-in-law Hortense de Beauharnais, queen of Holland, by whom he had a son, known later as the Duc de Morny. Flahaut fought in the Russian campaign of 1812 and in 1813 became aide-de-camp to Napoleon.

After Napoleon's abdication in 1814 he was placed on the retired list. The Hundred Days brought him into active service again, but his mission to Vienna to secure the return of Marie-Louise failed. He was saved from exile by Talleyrand's influence. Later he settled in England, where in 1819 he married Margaret Elphinstone, afterward Baroness Keith in her own right. The French ambassador opposed the marriage, and Flahaut resigned his commission.

Flahaut returned to France in 1827, and in 1831, under the July Monarchy, he was made a peer of France. He remained intimately associated with Talleyrand's policy and was ambassador in Berlin for a short time in 1831. He was afterward attached to the household of Ferdinand, duc d'Orléans. He was ambassador to Vienna from 1841 to 1848, when he was dismissed and retired from the army. After the coup d'état of 1851 he was again actively employed and from 1860 to 1862 was ambassador in London.

Flaherty, Robert (Joseph) (b. Feb. 16, 1884, Iron Mountain, Mich., U.S.—d. July 23, 1951, Dummerston, Vt.), U.S. explorer and filmmaker, called the father of the documentary film.

When he was a boy, Flaherty's family moved to Canada, and as he grew up he explored and photographed vast regions of the country's northern territory. His first film, *Nanook of the North* (1922), a dramatic interpretation of the Eskimo way of life, was based on 16 months of living with them and filming their lives. His film was an international success, and its subjective presentation of reality set a model of excellence for nonfiction filmmaking, foreshadowing the documentary movement of the 1930s. John Grierson, the founder of the movement, first used the term documentary in a reference to Flaherty's film, *Moana* (1926), set in the South Seas, a record of a people untouched by the corruption of civilization.

In the 1930s and '40s Flaherty's most famous films were *Tabu* (1931), codirected with the German director F.W. Murnau, *Industrial Britain* (1932), made with John Grierson, *Man of Aran* (1934), *The Land* (1942), and *Louisiana Story* (1948).

flail, ancient hand tool for threshing grain. It consists of two pieces of wood: the handstaff, or helve, and the beater, joined by a thong. The handstaff is a light rod several feet long, the beater a shorter piece. With a flail, one man could thresh 7 bushels of wheat, 8 of rye, 15 of barley, 18 of oats, or 20 of buckwheat in a day (one bushel equals about 35 litres).

Flail

The flail remained the principal method of threshing until the mid-19th century, when mechanical threshers became widespread (see thresher).

flake tool, Stone Age hand tools, usually flint, shaped by flaking off small particles, or by breaking off a large flake which was then used as the tool.

Whenever they were available, prehistoric man preferred to use flint and similar siliceous stones, both because of the ease with which they could be chipped and for the sharp cutting edges characteristic of this type of material. However, in many regions flint does not exist, and man was obliged to use whatever material was easily available, such as sandstones, quartzites, quartz, obsidian and various volcanic rocks.

The basic principle in the manufacture of

stone tools is the removal of a flake or series of flakes from a stone matrix. It is characteristic of all stone that a blow struck near an edge of a block will detach a chip or flake. Flakes may be removed from blocks by various natural causes such as wave action, pressure in the earth, and soil creep; but those produced intentionally by human activity exhibit definite characteristics. Their most important attribute is the bulb of percussion which appears on the lower surface of the flake just below the point where the blow was struck. Bulbs of percussion vary in size and shape, depending on the force and direction of the blow, the nature of the stone, and the nature of the object with which the blow was struck. The block from which a flake has been detached, the core or nucleus, bears the imprint of the bulb in the form of a bulbular cavity and also lateral ridges left by the removal of the flake. These ridges often form a definite pattern, showing that a piece has unquestionably been the work of humans. Flaking produced by natural causes is usually haphazard, and fractures by frost or heat are characterized by a series of concentric rings as opposed to the ripple marks left by a man-made fracture.

Flambard, Ranulf (d. Sept. 5, 1128), chief minister of King William II Rufus of England (ruled 1087–1100). Of Norman origin, Ranulf was made keeper of the seal for King William I the Conqueror about 1083, and during the reign of William II he became royal chaplain, chief adviser, and, for a time, chief justiciar. As administrator of the royal finances, he raised vast sums by increasing taxes and by exhorting funds from the barons and the church. He delayed for years in making appointments to vacant sees and abbeys in order to obtain their revenues for William's treasury.

In 1099 Ranulf was made bishop of Durham. William died shortly thereafter, and his successor, Henry I (ruled 1100–35), imprisoned Ranulf as a scapegoat for the late king's unpopular policies. Early in 1101 Ranulf escaped to Normandy and incited Duke Robert II Curthose to attempt an invasion of England, which was unsuccessful. Ranulf was restored to royal favour and to his bishopric in 1101.

flambé glaze, a rich, deep-red glaze slashed with streaks of purple and turquoise used to decorate pottery, particularly porcelain. The effect results from a particular method of firing a glaze that incorporates copper; the

method was first discovered by the Chinese of the Ming dynasty, probably during the reign of Wan-li (1573–1620). Examples of this old flambé work are now extremely rare. The process was at first difficult to control, but by the reign of Ch'ien-lung (1736–96) in the Ch'ing dynasty it had been mastered, and *ch'ui hung*, or blown red glaze ware, as flambé work was called, became very popular. The porcelain factory at Sèvres, Fr., produced a substantial amount of flambé work in the late 19th century. The process was revived in modern times by individual potters, notably Bernard Moore (1850–1935) in England.

flame, rapidly reacting body of gas, commonly a mixture of air and a combustible gas, that gives off heat and, usually, light and is self-propagating. Flame propagation is explained by two theories: heat conduction and diffusion. In heat conduction, heat flows from the flame front, the area in a flame in which combustion occurs, to the inner cone, the area containing the unburned mixture of fuel and air. When the unburned mixture is heated to its ignition temperature, it combusts in the flame front, and heat from that reaction again flows to the inner cone, thus creating a cycle of self-propagation. In diffusion, a similar cycle begins when reactive molecules produced in the flame front diffuse into the inner cone and ignite the mixture. A mixture can support a flame only above some minimum and below some maximum percentage of fuel gas. These percentages are called the lower and upper limits of inflammability. Mixtures of natural gas and air, for example, will not propagate flame if the proportion of gas is less than about 4 percent or more than about 15 percent.

flame-fusion process (synthetic gems): see Verneuil process.

flame thrower, military assault weapon that projects a stream of blazing oil or thickened gasoline against enemy positions. As used in World War II and later wars it consisted basically of one or more fuel tanks, a cylinder of compressed gas to supply the propelling force, a flexible hose connected to the tanks, and a trigger-nozzle equipped with some means of igniting the fuel as it was spewed forth. The portable type, carried on the backs of ground troops, had a range of about 45 yards (41 metres) and enough fuel for about 10 seconds of continuous "firing." Larger and heavier units installed in tank turrets could reach out more than 100 yards (90 metres) and carried enough fuel for about 60 seconds of fire. To achieve maximum results, several short bursts were usually fired rather than one long blast.

Modern flame throwers first appeared in the early 1900s when the German army tested two models, one large and one small, submitted by Richard Fiedler. The smaller *Flammenwerfer*, light enough to be carried by one man, used gas pressure to send forth a stream of flaming oil for a distance of about 20 yards (18 metres). The larger model, based on the same principle, was cumbersome to transport but had a range of more than 40 yards (36 metres) and enough fuel for 40 seconds of continuous firing. The German army adopted these weapons and used them with surprise effect against Allied troops in 1915. The British and French soon countered with flame throwers of their own, but all the World War I types had limited range and duration of fire. Their chief effect seems to have been to terrorize the troops that they were used against.

All major powers employed flame throwers in later years, both the back-pack type and the tank-mounted variety. Based on the same principle as Fiedler's early models, they incorporated technical refinements that made them more effective. British and U.S. flame throwers were fuelled with napalm, a type of thickened gasoline that carried much farther than ordinary gasoline, burned with intense heat, and clung like jelly to whatever it touched. These fearsome weapons were valuable for attacking enemy troops, burning away camouflage material, and probing underbrush or the gunports of enemy positions. They were especially effective in World War II against the defensive-type warfare of the Japanese who defended their caves and coconut-log bunkers on Pacific islands. During the 1950s the U.S. army chemical corps developed a lightweight, one-shot portable flame thrower that could be used against fortified positions at close range.

flamenco, form of song, dance, and instrumental (mostly guitar) music commonly associated with the Andalusian Gypsies of southern Spain. (There, the Gypsy, or Rom, people and their language are known as *Caló*, or *Gitano*.) The roots of flamenco, though somewhat mysterious, seem to lie in the Gypsy migration from Rājasthān (in north-west India) to Spain between the 9th and 14th centuries. These migrants brought with them musical instruments, such as tambourines, bells, and wooden castanets, and an extensive repertoire of songs and dances. In Spain they encountered the rich cultures of the Sephardic Jews and the Moors. Their centuries-long cultural intermingling produced the unique art form known as flamenco.

The cante, or song. The essence of flamenco is *cante*, or song. Flamenco songs fall into three categories: *cante jondo* ("profound song," or "deep song"), *cante intermedio* ("intermediate song," also called *cante flamenco*), and *cante chico* ("light song"). The *cante jondo*, whose structure usually is based on a complex 12-beat rhythm, is thought to be the oldest form. It is characterized by profound emotion and deals with themes of death, anguish, despair, or religious doubt. Each song style is distinguished by a characteristic rhythm and chord structure; yet several types of *cante* may share the same rhythm but individualize accentuation, subtleties, and emotional content.

The ancestry of many types of song is traceable. Thus, the serious *soleares*, a descendant of the much older *cañas*, gave rise to the light *alegrías*, from which developed other light-song types, such as the *bulerías*. Other forms, such as the *fandangos grandes*, were adopted from Spanish folk song and dance, the *fandangos* becoming more serious in character than the original and begetting a series of descendants that includes the *malaqueñas* and the Arab-influenced *carriagenas*. Latin

Porcelain bottle decorated with a flambé glaze, 18th century, Ch'ing dynasty; in the Victoria and Albert Museum, London

American influence appears in later genres such as the *runbas gitanas* and the *colombianas*.

The baile, or dance. After the mid-19th century, flamenco song was usually accompanied by guitar music and a *palo seco* (Spanish: "dry stick," a stick that was beat on the floor to keep time) and a dancer performing a series of choreographed dance steps and improvised styles. *Baile*, or dance, has been the dominant element of flamenco since that time, though it is never performed without accompaniment.

As an accompanist to the dancer (*bailaor* [male], *bailaora* [female]), the singer (*cantaor*) relates the legends and stories of daily life that reflect the experiences of an outcast subculture within predominately white, Christian Spain. The dancer is the protagonist of the singer's narrative and its interpreter. The *baile* is a sensuous display of fluid motion, stylized and yet highly personal, involving movement of the arms (*braceo*) and upper torso, hand and finger movement (*floreo*), footwork (*zapateado*), and heelwork (*taconeo*), which are often displayed in long solo passages (*solea*). Male dancers usually perform intricate footwork, whereas female dancers, traditionally wearing elaborately ruffled dresses, emphasize the hands and upper torso. The guitarist (*tocaor*) keeps the rhythm (*compás*) necessary to the dancer's individual rhythmic cadences, accompanying (and, when the performance space is large, even following) the dancer.

A deeply musical dancer, after a 15- or 20-minute sequence, is said to fall into a *duende*, an intensely focused, trancelike state of transcendent emotion that Federico García Lorca in 1933 described as *los sonidos negros* ("the dark sounds") invading the performer's body. This extraordinary state is enhanced by rhythmic hand clapping and encouraging interjections (*jaleo*) from the audience and fellow performers. Caló flamenco performers regard the *cante jondo* as a form of prayer, and thus, in *duende*, the dancer communicates with both the audience and God. What may well reveal the ancient origins of flamenco are the gestures of the profound dance (*baile grande*), in which the arm, hand, and foot movements closely resemble those of classical Hindu dance of the Indian subcontinent.

History. The golden age of flamenco is usually considered to be the period between roughly 1780 and 1845. Singing was then the primary aspect of flamenco, dancing and musical accompaniment being secondary. What had been an essentially outdoor, outsider, family-oriented activity that focused on *cante* was transformed beginning in 1842, when Silverio Franconetti founded the first *café cantante*, *Café sin Nombre*, in Seville. That establishment and the many others that sprang up in the major urban centres of Spain—notably Granada, Cordoba, and Seville—placed emphasis on the musicians and dancers, and it was in this period that the singer began to take a secondary role. While these commercial interests afforded a living for many performers for the first time, they also brought about what many considered a bastardization of an authentic indigenous art form. Several intellectuals, including Lorca and composer Manuel de Falla, sought to restore the purity of flamenco, and in 1922 they instituted the first flamenco competition—calling for *cante primitivo andaluz* ("primitive Andalusian cante"). This timely attempt to prevent the further debasement of an authentic folk art effectively promoted flamenco to a sophisticated urban public and helped to further the thoughtful development of the art within a modern context. Much of the style's spirit is captured in Spanish filmmaker Carlos Saura's *Flamenco* (1995). (N.D.B.)

BIBLIOGRAPHY. Aziz Balouch, *Spanish Cante Jondo and Its Origin in Sindh Music* (1968; originally published in Spanish, 1955); Barbara Thiel-Cramér, *Flamenco: The Art of Flamenco, Its History, and Development Until Our Days*, trans. from Swedish (1991); Juan Serrano and José Elgorriaga, *Flamenco, Body and Soul: An Aficionado's Introduction* (1990).

flamingo, any of five species of tall wading birds, constituting the family Phoenicopteridae of the order Ciconiiformes, which also includes the herons, bitterns, and storks. They are considered by some authorities to be a distinct order, Phoenicopteriformes.

Flamingos have webbed feet, slender bodies, long, thin necks, large wings, and short tails. They range from about 90 to 150 centimetres (3 to 5 feet) tall. The pink colour of their plumage is produced by their consumption of *Spirulina*, blue-green algae and other sources of carotenoids.

Flamingos are gregarious birds; flocks numbering hundreds may be seen in long, curving flight formations and in wading groups along the shore. In feeding, the flamingo tramps the shallows, stirring up organic matter, especially minute mollusks and crustaceans, which it strains from the muddy water by means of its sieve-like lamellated bill. The nest is a truncated cone of clayish mud piled up a few inches in a shallow lagoon; both parents share the month of incubation of the one or two chalky-white eggs that are laid in the hollow of the cone. Downy white young leave the nests in two or three days and are fed by regurgitation.

Lesser flamingo (*Phoeniconaias minor*)

Norman Myers—Bruce Coleman, Inc.

Two geographically separated, distinct subspecies compose *Phoenicopterus ruber*: the Caribbean, or American, flamingo (*P. r. ruber*), which breeds in large colonies on the Atlantic and Gulf coasts and islands of tropical and subtropical America, and, the greater flamingo (*P. r. roseus*), which is found in Africa, southern Europe, and southern Asia. The Chilean flamingo (*P. chilensis*) is primarily an inland species having gray legs with pink bands at the joints. Both the Andean flamingo (*Phoenicoparrus andinus*) and the Puna flamingo (*Phoenicoparrus jamesi*; also called James', or James's, flamingo), which was once thought to have been extinct, are found chiefly in the Andes Mountains. The lesser flamingo (*Phoeniconaias minor*; see photograph), which inhabits the lake district of eastern Africa and parts of South Africa, Madagascar, and India, is the most abundant of the flamingo species. It is also the smallest of the flamingos and the deepest in colour.

Flaminius, Titus Quinctius (b. c. 229 BC—d. 174), Roman general and statesman who established the Roman hegemony over Greece. Flaminius developed the policy of turning the cities, leagues, and kingdoms of the Hellenistic world into clients of Rome and of himself, a policy that became the basis of Roman hegemony of the Mediterranean.

Flaminius was a military tribune during the

Second Punic War (218–201) and had a distinguished military career. Elected quaestor in 205, he exercised the authority (*imperium*) of a praetor at Tarentum in southern Italy, and he twice (202, 200) was involved in the distri-

Flaminius, portrait on a Greek gold coin struck after 196 BC; in the British Museum

Peter Clayton

bution of lands to victorious troops. These veterans helped elect him consul for 198. He went to Greece with a fresh army to continue the Second Macedonian War against Philip V of Macedonia.

After an initial victory over Philip, he devoted himself to winning over the Greek cities and leagues by diplomacy and, in the case of the Achaean League (*q.v.*), by force. By spring 197 Flaminius had made allies of most of Greece and defeated the isolated Philip by superior tactics at the battle of Cynoscephalae.

Philip of Macedonia was driven from Greece, but Flaminius frustrated the attempts of his allies, the Aetolian League, to dominate other Greek cities. At the Isthmian Games of 196, in a spectacular ceremony reported by the Greek historian Polybius, Flaminius proclaimed all Greeks in Europe and Asia free and autonomous. (The inclusion of the Greek cities of Asia was meant to subvert the influence of the Seleucid king of the Hellenistic Syrian empire, Antiochus III, who was Philip's ally.) In 194 all Roman troops were withdrawn from Greece, where Flaminius was given divine honours. Flaminius's success was built on an ambiguity. For Greeks the proclamation of freedom meant self-rule, but in Roman law a freed slave (*libertus*) became the client of his former master and still owed his patron respect and political obedience.

In 193 Antiochus was invited into Greece by the Aetolians, still smarting from the frustration of their ambitions by Flaminius. When Antiochus refused to withdraw, Flaminius announced that Rome's next mission was the liberation of the Greek cities of Asia. The victorious war was fought by Scipio Africanus and his brother, but Flaminius remained active in diplomacy. He was elected censor for 189. Thereafter little is known of Flaminius until his death in 174.

Flaminius, Gaius (d. 217 BC), Roman political leader who repeatedly challenged the authority of the Senate. A plebeian, he held the tribunate in 232. Despite the opposition of the Senate and (according to legend) of his own father, he won passage of a measure to distribute land among the plebeians.

As consul in 223 he defeated the Insubres after disobeying a senatorial order; despite opposition from the Senate, he was granted a triumph by popular vote. Flaminius was the first governor of the Roman province of Sicily. During his censorship (220) he built the Circus Flaminius on the Campus Martius and constructed the Via Flaminia to Ariminum. In 218 he was one of the chief supporters of the Lex Claudia, which barred senators from engaging in commercial activities. His election to a second consulship for 217 reflected pop-

ular criticism of the Senate's conduct of the war against the invading Carthaginians under Hannibal.

Flaminius hastened to cover the western Apennines at Arretium (now Arezzo). When Hannibal slipped past, the Roman commander marched south, probably in an attempt to join his colleague Servilius, who was advancing from Ariminum. On the way Flaminius fell into Hannibal's ambush at Lake Trasimenus (now Trasimeno) and was killed.

Flamsteed, John (b. Aug. 19, 1646, Derby, near Derby, Derbyshire, Eng.—d. Dec. 31, 1719, Greenwich, London), founder of the Greenwich Observatory, and the first astronomer royal of England.

Poor health forced Flamsteed to leave school in 1662. He studied astronomy on his own and later (1670–74) continued his education at the University of Cambridge. In 1677 he became a member of the Royal Society. Ordained a clergyman in 1675, Flamsteed in 1684 received the income of the living of Burstow, Surrey. His report to the Royal Society on the need for a new observatory resulted in the founding (1675) of the Royal Greenwich Observatory, of which he was the first director (and hence astronomer royal). He found that he himself had to supply all the instruments at Greenwich, apart from a few gifts; he was forced to take private pupils to augment his income. A small inheritance from his father, who died in 1688, provided the means to construct a mural arc, a wall-mounted instrument for measuring the altitudes of stars as they passed the meridian.

The latter part of Flamsteed's life passed in controversy over the publication of his excellent stellar observations. He struggled to withhold them until completed, but they were urgently needed by Isaac Newton and Edmond Halley, among others. Newton, through the Royal Society, led the movement for their immediate publication. In 1704 Prince George of Denmark undertook the cost of publication, and, despite the prince's death in 1708 and Flamsteed's objections, the incomplete observations were edited by Halley, and 400 copies were printed in 1712. Flamsteed later managed to burn 300 of them. His own star catalog, *Historia Coelestis Britannica* (1725), listed more stars (3,000) and gave their positions much more accurately than did any other previous work. Some stars, such as 61 Cygni, are still known by their numbers in his system.

Flanders, French FLANDRE, Flemish VLAANDEREN, medieval principality in the southwest of the Low Countries, now included in the French *département* of Nord (*q.v.*), the Belgian provinces of East Flanders and West Flanders (*qq.v.*), and the Dutch province of Zeeland (*q.v.*). The name appeared as early as the 8th century and is believed to mean "Lowland," or "Flooded Land."

The origins of Flanders lay in the *pagus* Flandrensis, an area composed of Brugge (Bruges) and its immediate environs under the administration of the Frankish empire. At first Flandrensis was an inconspicuous district, but beginning in the 9th century, a remarkable line of Flemish counts succeeded in erecting a quasi-independent state on the borders between the French and German kingdoms.

When Charlemagne's empire had been divided under the Treaty of Verdun (843), the Schelde River had been made the dividing line between the Western and Eastern Frankish kingdoms. The rise of Flanders began when the official administrator of the *pagus*, Baldwin I Iron-Arm, married the Western Frankish king Charles II the Bald's daughter in 862 and was appointed count of Flanders. His successors as count, among them Baldwin II (ruled 879–918), Arnulf I the Great (918–965), Baldwin IV the Bearded (988–1035), and Baldwin V (1035–67), gradually expanded

their domain southward to the towns of Douai and Arras and eastward across the Schelde River to Ghent and Antwerp. These counts were vassals of the French king for what they held west of the Schelde (Crown Flanders, or Kroonvlaanderen, the most important part of the kingdom), and vassals of the German king for what they held east of it (called Imperial Flanders, or Rijksvlaanderen, as part of the Holy Roman Empire). The Flemish counts enjoyed virtual independence from weak French kings during this time. The first dynasty of counts died out in 1119, but Flanders rose to the height of its power and wealth under a later line of counts whose principal members were Thierry of Alsace (1128–68) and his son Philip (1168–91).

The population of Flanders, though politically united under the rule of their counts, was far from homogeneous. In the southernmost area it was mainly Romance-speaking; farther north the Frankish settlement had been denser, so that the language was Germanic; and the coastal areas had been settled with people of Saxon and Frisian origin. The counts of Flanders effectively united these peoples into one nation. From the 12th century onward, they substituted for the old feudal structure an orderly administration and fiscal organization, set up a centralized judicial system (using Roman law), and began extensive legislation. Thierry and Philip granted charters to a number of wealthy towns, and the commune (*q.v.*) movement developed independently during this same period. This led to the establishment in many towns of municipal governments that had a considerable measure of independence.

At the outset the Flemish economy had been agricultural, but about the 12th century Flemish trade and industry became of real international importance. A crisis in the old manorial organization of agriculture and an expansion of the money economy coincided with the rise of towns as centres of trade and industry. The cloth industry, which was soon working mainly with English wool and producing high-quality textiles, had its largest centres at Ghent and at Ypres. Until the 13th century Flemish merchants conducted their trade abroad, especially at the fairs of Champagne, but later merchants of all nations came to Flanders, and the seaport of Brugge became a centre of world commerce. Flanders profited from its geographic situation, being an intermediary between the Mediterranean and the Scandinavian and Baltic countries and also between England and the Rhineland (especially Cologne).

Flanders had a tumultuous history in the 13th and 14th centuries. Philip's successor, Baldwin VIII (1191–95), lost Artois and other southern domains to France, and Flanders was fatally weakened by the departure of his successor, Baldwin IX, to become Latin emperor of Constantinople (as Baldwin I) in 1205. The French king Philip II Augustus seized the chance to influence the succession in Flanders, and when the Flemings resisted and formed an anti-French alliance with John of England and the Holy Roman emperor Otto IV, Philip defeated the coalition at the Battle of Bouvines (1214).

Flemish resentment of French influence continued, however, and in 1297 the count of Flanders, Guy of Dampierre (1278–1305), entered an alliance with Edward I of England against Philip IV of France. Philip was nevertheless able to invade Flanders in 1300 and take Guy prisoner. In 1302 the Flemings of Brugge massacred the town's French garrison (an event known as the Matins of Brugge), and Philip sent a powerful French army into Flanders to take revenge. The Flemings, however, inflicted a disastrous defeat on this army at the Battle of the Golden Spurs (July 11, 1302). This victory saved Flanders from French occupation, and France formally recognized Flemish independence in 1305.

In the 14th century a new political problem arose: the large towns, especially Ghent, began trying to establish communal autonomy against the counts in the manner of independent city-states. In consequence, the counts looked for support to the French kings. When the Hundred Years' War between England and France broke out, the count of Flanders, Louis I (1322–46), sided with the French while the weavers of the Flemish towns, under the leadership of Jacob van Artevelde, sided with England, knowing as they did that the continued supply of English wool was indispensable to their prosperity. Artevelde and Louis I died within one year of each other (1345–46), and the next count of Flanders, Louis II, established peace in the country and pursued a course midway between France and England. The weavers of Ghent briefly rose against him under the leadership of Philip van Artevelde but were defeated by a French royal army at the Battle of Rozebeke (1382).

Louis II died in 1384, leaving Flanders to his daughter Margaret, whose second husband, Philip the Bold, duke of Burgundy, thereby succeeded to the county of Flanders. This event was the starting point for the eventual political unification of the Low Countries under the dukes of Burgundy (and later under the Habsburgs). The Flemish economy had begun to decline by the late 15th century, but Flanders remained a rich country that was important to the revenues of the Burgundian dukes. In 1477 Mary of Burgundy married Maximilian of Austria (later Emperor Maximilian I), thus bringing Flanders under the Habsburgs. Protestantism won many adherents in Flanders during the Reformation, but the military occupation of the country by the Spaniards reversed this development. Flanders remained with the other southern provinces of the Netherlands under Spanish rule in the 17th century and then (from 1714) under Austrian rule until it disappeared as a political entity during the French Revolutionary Wars. The title count of Flanders remains in use, however, for princes of the Belgian royal family.

Flanders, Flemish VLAAMS, formally FLÉMISH REGION, Flemish VLAAMSE GEWEST, region that comprises the northern half of Belgium. Flanders was created in 1995 in the reorganization of Belgium's provincial administration along ethnic-linguistic lines. It includes the Flemish-speaking provinces of Antwerp, East Flanders, Limburg, Flemish Brabant, and West Flanders (*qq.v.*). The Brussels-Capital Region lies within but is administratively separate from the region. Flanders' elected assembly forms a regional government that is charged with broad authority over social and economic policy and administration. Ghent is the capital of the region. Area 5,221 square miles (13,522 square km). Pop. (1993 est.) 5,824,628.

Flandin, Pierre-Étienne (b. April 12, 1889, Paris, France—d. June 13, 1958, Saint-Jean-Cap-Ferrat), lawyer, politician, and several times a minister during the final years of France's Third Republic.

Flandin was a deputy from 1914 to 1940 and, in addition, held various ministerial posts. He also served as premier from November 1934 to May 1935. When in March 1936 the Germans sent their troops into the Rhineland, Flandin, as foreign minister, suggested the use of French armed forces to evict them, but he

was supported by only a minority of ministers. His failure to induce the French and British governments to act convinced him that Germany would dominate Europe and that France should accept the inevitable.

In the Vichy regime Flannagan was associated with the more moderate collaborators. They succeeded in bringing him into the government as foreign minister in Pierre Laval's place, but his inclusion lasted only until February 1941, when Admiral Jean Darlan replaced him. After the liberation of France, the high court of justice in 1946 acquitted him of treason and sentenced him to five years of "national unworthiness" but remitted this sentence on account of some services he had rendered to the Résistance.

Flannagan, John Bernard (b. April 7, 1895, Fargo, N.D., U.S.—d. Jan. 6, 1942, New York, N.Y.), American sculptor notable for his small, primitivistic sculptures of animals, birds, fish, and birth themes.

Trained as a painter at the Minneapolis Institute of Arts, Flannagan was encouraged by Arthur B. Davies to take up wood carving, and for five years he worked almost exclusively in this medium. While living in upper New York state, he first became attracted to the natural beauty of fieldstone, and he worked for many years in this medium, seeking images that seemed to have evolved from nature rather than from the sculptor's hand. Flannagan defined his sculpture as a species of occult fossil and dredged the subconscious for inspiration.

The traumatic process of becoming was Flannagan's most effective poetic theme; it informed his major works—e.g., "Triumph of the Egg" (1937 and 1941) and perhaps even the timid "Dragon Motif" (1933). The spirit of the inert material seems to emerge from these works and mingle with the impressions made by the carver. In both formal and philosophical ways, Flannagan was similar to the artists of ancient India. Shortly before he committed suicide, Flannagan had begun to work in wrought bronze.

flannel, fabric made in plain or twill weave, usually with carded yarns. It is napped, most often on both sides, the degree of napping ranging from slight to so heavy that the twill weave is obscured. Fibre composition and amount of napping are dependent on the intended use. Flannel is a relatively warm fabric, since still air is held in the fabric because of the napping. Addition of a man-made fibre to the blend increases the resistance to abrasion and hence may lengthen the life of the fabric. Furthermore, some of these blends help to prevent stretching, so that a better fit is maintained. Crease retention is improved with some blends such as acrylic fibre.

For outerwear, generally wool or blends with wool, or blends of man-made fibres, are used in an even-twill weave. With an all-wool flannel fabric excellent tailored garments can be produced; felting shrinkage can be prevented by blending with various man-made fibres, and washable men's suits are produced through blending wool with acrylic, nylon, or polyester fibres.

Cotton flannels are made with soft-spun filling yarns. There are various types, according to use, with many generic names; for example, flannelette, a lightweight fabric napped on one side only, and suede cloth, which has an extremely short, compact nap treated to give a smooth, flat texture.

flannelbush (*Fremontodendron californicum*), shrub of the cacao, or chocolate, family (Sterculiaceae) of the order Malvales, native to southwestern North America. The lower leaf surfaces have a felty texture. The shrub grows up to 5 m (16 feet) tall and bears alternate,

Flannelbush (*Fremontodendron californicum*)
W H Hodge

lobed leaves about 2.5 cm (1 inch) long. The yellow, solitary flowers are about 5 cm across.

flap, in phonetics, a consonant sound produced by a single quick flip of the tongue against the upper part of the mouth, often heard as a short *r* in Spanish (e.g., in *pero*, "but") and similar to the pronunciation of the sound represented by the double letter in American English "Betty" and some forms of British English "berry."

flare, combustible device used to emit a dazzlingly bright light for signaling or illumination on railroads and highways and in military operations. In pyrotechnics the term is applied either to a coloured-fire composition burned in a loose heap or to a similar composition rolled into a paper case to ensure longer and more regular burning.

The flare in its present form dates from the early part of the 19th century, when the introduction of potassium chlorate permitted the development of chemical mixtures to produce coloured light. Previous to this the only colour had been the bluish white light produced by a mixture of sulfur, saltpetre, and orpiment. These blue lights, as they were called, were and still are often used at sea for signaling and illumination. They were also known as Bengal lights, probably because Bengal was the chief source of saltpetre.

The introduction of colours that could readily be recognized at a considerable distance opened up a much wider field for the use of flares at sea. From the middle of the 19th century, many patents were granted, most of them for a means of self-ignition. Subsequent inventions provided for ignition on the same principle as the modern safety match and for the waterproofing of the surface. Lights of this kind are usually fitted with a wooden handle.

Coloured flares of high light intensity are carried as standard equipment in ships' lifeboats; the high intensity is obtained by the incorporation of magnesium, or magnesium alloy, in the composition. Flares are also used to warn motorists of highway obstructions. Commercial highway vehicles carry flares to be used in the event of distress or breakdown.

flare star, also called UV Ceti star, any star that varies in brightness, sometimes by more than one magnitude, within a few minutes. The cause is thought to be the eruption of flares much larger than, but otherwise similar to, those observed on the Sun. Flare stars are sometimes called UV Ceti stars, from a prototype star in the constellation Cetus. Proxima Centauri, the closest star to the Sun, is a flare star. All known flare stars are red dwarfs; flares in intrinsically brighter stars are not presently detectable. In UV Ceti and a few others, radio flares have been observed often corresponding to the optical outbursts.

flash lamp, any of several devices that produce brief, intense emissions of light useful in photography and in the observation of objects in rapid motion.

The first flash lamp used in photography was invented in Germany in 1887; it consisted of a trough filled with *Blitzlichtpulver* ("flashlight powder"), a mixture of magnesium, potassium

chlorate, and antimony sulfide. Upon ignition the powder burned quickly, providing a brilliant white light, but it also released a dense cloud of white smoke and was hazardous.

The flashbulb, developed in the 1920s, is a transparent envelope filled with oxygen and a tangle of fine aluminum, magnesium, or zirconium wire ignitable by an electrically heated filament or, rarely, a chemical deflagrator. Luminous combustion of the metal is complete within a few hundredths of a second. Most flashbulbs are coated with tinted lacquer or plastic to prevent shattering and to adjust the colour of the light.

The electronic flash lamp, commonly called a flashtube, or speedlight, consists of a transparent glass or quartz tube filled with xenon (or, occasionally, other noble gases) and fitted with electrodes. High voltage from a capacitor charges the electrodes and causes the gas to ionize; when an ionization path is complete, a pulse of current passes between the electrodes, causing the gas to flash and discharging the capacitor. The duration of the flash can be as short as one microsecond, and circuitry can be arranged to cause the lamp to operate several thousand times per second. The flashtube was invented in 1931 by Harold Edgerton of the Massachusetts Institute of Technology.

flash point, the lowest temperature at which a petroleum product will burn. Below this temperature insufficient petroleum vapour is available to support combustion. Before gasoline became important, kerosine was the main petroleum product produced. The tendency to leave as much of the highly volatile gasoline as possible in the kerosine caused numerous fires and explosions in tanks and oil lamps. Legal measures were instituted to curb the danger, and test methods were prescribed and minimum flash points set.

Minimum flash points have been set not only for kerosine and other volatile petroleum products but also for such low-volatility products as lubricating oil, diesel oil, and fuel oil. While such standards might be useful in providing the safety margins for storing, handling, or transporting high-volatility petroleum products, they are superfluous for those of low volatility. Probably this practice is a held-over tradition and is based on the belief that the flash point is a measure of volatility, a fact true only for products that boil over a narrow temperature range.

flash spectrum, array of wavelengths detectable in the emissions from the limb of the Sun during the flash periods of a few seconds just after the beginning of totality during a solar eclipse or just before the instant of its termination. When the solar photosphere is occulted by the Moon, the layers of the Sun's atmosphere flash into prominence, and the spectrum briefly shows the bright lines produced by tenuous hot luminous gas. Except during eclipses, this part of the spectrum is masked by the glare of the Sun's disk. Study of the flash spectrum gives information about the physical state of the solar chromosphere. The flash spectrum was first observed by the American astronomer Charles Augustus Young during the eclipse of Dec. 22, 1870.

flashback, in motion pictures and literature, narrative technique of interrupting the chronological sequence of events to interject events of earlier occurrence. The earlier events often take the form of reminiscence. The flashback technique is as old as Western literature. In the *Odyssey*, most of the adventures that befell Odysseus on his journey home from Troy are told in flashback by Odysseus when he is at the court of the Phaeacians.

The use of flashback enables the author to start his story from a point of high interest, and to avoid the monotony of chronological exposition. It also enables him to keep the story in the objective, dramatic present.

In motion pictures, flashback is indicated not only by narrative devices but also by a variety of optical techniques such as fade-in or out (the emergence of a scene from blackness to full definition, or its opposite), dissolves (gradually exposing a second image over the first while it is fading away), or iris-in and out (the expansion or contraction of a circle enclosing the scene).

flashbulb, one-time light bulb giving a single bright burst of light, used in photography. *See* flash lamp.

flashtube, electric discharge lamp giving a very bright, very brief burst of light, useful in photography and engineering. *See* flash lamp.

flat bark beetle, also called **CUCUJID BEETLE**, any member of the approximately 500 species belonging to the insect family Cucujidae (order Coleoptera). These beetles, easily recognized by their narrow, flattened bodies, occur throughout the world and are usually brown in colour, although some species are red.

Many (*e.g.*, *Cucujus*, *Catogenus*) live under tree bark and feed on mites and wood-boring insects; a few are stored products pests such as the rust-red grain beetle (*Cryptolestes ferrugineus*), which eats the germ of grains. The larger cucujid beetles are about 12 millimetres ($\frac{1}{2}$ inch) long. Sometimes included in the flat bark beetle family is the flat grain beetle (*q.v.*) family Silvanidae.

flat bug, also called **FUNGUS BUG**, any small, flat, dark-coloured insect of the family Aradidae (order Heteroptera), which numbers about 1,000 species. Members occur in all zoogeographic regions.

Flat bug (*Mezira pacifica*), adults and nymphs
E S Ross

Flat bugs, usually found under stones or in crevices, feed on fungi and moisture in decaying wood. Their wings, though well developed, remain quite small.

flat grain beetle, any member of the insect family Silvanidae (order Coleoptera), closely related to and sometimes included in the flat bark beetle (*q.v.*) family Cucujidae. These beetles are usually less than 3 millimetres (0.1 inch) in length.

Many species live under the bark of trees. Others (*e.g.*, the saw-toothed grain beetle *Oryzaephilus surinamensis*) feed on grains and have become serious pests wherever grain is stored.

flat-headed cat (*Felis planiceps*), extremely rare Asian cat found in the Malay Peninsula, Sumatra, and Borneo. One of the smallest members of the cat family, Felidae, the adult is from 40 to 60 centimetres (16 to 24 inches) long without the 15–20-cm tail and weighs from 1.5 to 2.5 kilograms (3.3 to 5.5 pounds). Its coat is reddish above and white with red spots below; there are white markings around the eyes. It is the only felid known to include any substantial amount of vegetation in its diet, with a preference for fruit and, when available, sweet potatoes and similar foods. Little else is known about this cat, which is reported to be nocturnal and to hunt fish and frogs along rivers.

flat stitch (knitting): *see* plain stitch.

flatbed press, printing press employing a flat surface for the type or plates against which paper is pressed, either by another flat surface acting reciprocally against it or by a cylinder rolling over it. It may be contrasted to the rotary press (*q.v.*), which has a cylindrical printing surface. The first cylinder flatbed press

The Franklin press, an early flatbed press for hand printing
The Bettmann Archive

was built by Friedrich Koenig of Germany and used by *The Times* of London in 1814.

In the platen press, a flat surface bearing the paper is pressed against the flat, inked printing plate; the two surfaces come together and part with a jawlike motion. Most small hand presses are platen presses. Both cylinder and platen types of flatbed presses operate at speeds of 1,000 to 4,000 impressions per hour.

flatbill, any of six species of Central and South American birds belonging to the tyrant flycatcher family Tyrannidae (order Passeri-

Rufous-tailed flatbill (*Ramphotrigon ruficauda*)
Painting by John P. O'Neill

formes). Flatbills, which constitute the genera *Rhynchocyclus* and *Ramphotrigon*, are distinguished by their exceptionally broad and flat bill. All are olive, marked with gray, brown, or black above and yellow or brownish below. In length they are 15–17 centimetres (6–7 inches).

flatfish, order name PLEURONECTIFORMES, any of about 600 species of bony, oval-shaped, flattened fishes, such as the flounder, halibut, and turbot.

A brief treatment of flatfishes follows. For full treatment *see* MACROPAEDIA: Fishes.

Flatfishes are found from tropical to cold waters. Most are marine and live at moderate depths along the continental shelf, but some enter or live permanently in freshwater. Flat-

Flatfish (*scophthalmus*)
Jacques Six

fishes are carnivorous bottom dwellers that habitually rest on one side, often partly buried in the sand or mud. Some are also able to change colour and can blend effectively with a variety of surroundings.

One of the most notable features of the flatfish is the location of the eyes—both on one side of the head. Another is the colouring; the eyed side of the fish (uppermost as it lies on the bottom) is pigmented, but the lower, blind side is normally white. Other characteristics include a long dorsal fin on the back and a long anal fin on the belly. The flatfishes of the family Pleuronectidae, including about 100 species, usually have their eyes on the right side of the body. Members of the family Bothidae, about 200 species, are characteristically left-sided—that is, they have their eyes and colouring on the left side of the body. Other important families are the Soleidae (soles) and Cynoglossidae (tongue soles).

Flatfishes vary considerably in size. Small species may reach a length of only about 10 centimetres (4 inches); the largest, the Atlantic halibut (*Hippoglossus hippoglossus*), may reach a length and weight of about 2 metres (7 feet) and 325 kilograms (720 pounds). Many species, such as the halibuts and turbot, are highly valued as food.

For more information on flatfish species and groups, *see* dab; flounder; halibut; plaice; sanddab; sole; tongue sole; turbot.

flatfoot, congenital or acquired flatness of the longitudinal arch of the foot. Usually associated with loss of the arch is a rolling outward of the foot and heel, resulting in a splayfoot position. Normally the arch is maintained by the shape of the bones and by the ligaments and muscles of the foot. Of these three, the muscles are most important. At an early stage the foot may be flexible, and the flatness may result from stretching of the ligaments and weakness of the muscles. At a later stage the shape of the bones may be altered and the deformity become rigid.

Little is known regarding the causation of congenital flatfoot. All infants appear to have flat arches at birth because of the pad of fat

under the instep. The normal arch does not appear until the infant begins to walk and thus develops his muscle power. Failure of development of the arch may be a normal racial or familial characteristic. In general, the problem is a disproportion between the weight to be borne and the muscles to bear it. In a few persons the deformity seems to result from excessive weight or an injury.

Many symptoms have been attributed to flatfoot—pain, swelling, muscular spasm, stiffness, and awkward gait. Other vague symptoms in the extremities and back, sometimes considered to be caused by flatfoot, probably are the result of the generalized muscle weakness that also produced flatfoot. Many persons who have flatfeet are entirely without disability or pain.

The aim of treatment is to secure proper position of the arch and heel by the use of adequate shoes, with or without supports, and to preserve that position by strengthening the muscles maintaining correction of arch and heel. Supports are indicated if pain is severe or fatigue excessive, but their prolonged use may weaken muscles. Few persons have pain severe enough to require surgery.

Flathead, Salish-speaking Indian tribe of what is now western Montana, U.S., whose territory extended from the crest of the Bitterroot Range to the Continental Divide of the Rockies and centred on the upper reaches of the Clark Fork of the Columbia River. Salish was the native name of the tribe, but Flathead is now customary; they themselves did not practice head-flattening, but some of their slaves came from tribes that did. Some early accounts termed all Salish-speaking tribes Flathead (*see* Salish).

The Flatheads were the easternmost tribe of the so-called Plateau culture area but exhibited many of the traits of the Plains Indians just east over the Rockies. The Flatheads had acquired horses in great number and mounted annual fall expeditions to hunt bison on the Plains, often warring with Plains tribes. Furthermore, Plains-type warfare and its honours were emphasized, including staging war dances, killing and scalping enemies, making quick coups (simply touching enemies to shame them), and stealing horses.

The Plains tepee was the usual dwelling of the Flatheads, though the A-framed, mat-covered lodge, a typical Plateau structure, was also used. Western Flathead groups had bark canoes, but eastern groups had only the makeshift bison-skin tubs known as bullboats, typical of the Plains. Fishing was important among them, as it was among other Plateau Indians.

Flathead religious belief centred on guardian spirits, with whom one communicated in visions. A spirit could bring good fortune or health to the person it guarded or disease and misfortune to others. There were also shamans, or medicine men.

Since 1872 the Flatheads have resided primarily on the Flathead Indian Reservation north of Missoula, Mont.

flathead, any of the flattened marine fish of the family Platycephalidae (order Scorpaeniformes), found in the Indo-Pacific and in tropical regions of the eastern Atlantic. Flatheads are elongated, large-mouthed fish with tapered bodies, two dorsal fins, and rough scales. As their name indicates, the head, which is large and covered with ridges and spines, and the forward part of the body are flattened from top to bottom. The fish are carnivorous and generally live on the ocean bottom, buried beneath the surface. They are commercially valuable food fish and range in size to a maximum of about 1.3 m (50 inches) and 15 kg (33 pounds).

Flathead Lake, lake in the Flathead National Forest of northwestern Montana, U.S., marking the southern limit of the Rocky Mountain Trench, a structural depression extending northward to the Liard Plain. Bordered on the east shore by the Mission Range and on the west by the forested foothills of the Salish Mountains, it is 30 miles (48 km) long, 15 miles (24 km) wide, and 220 feet (67 m) deep and has an area that ranges from about 197 square miles (510 square km) to about 188 square miles (487 square km). Named for the Flathead (Salish) Indians (whose reservation adjoins the lake on the south), it was formed

Flathead Lake, Montana
David Muench—EB Inc

by glacial damming of the Flathead River, which enters the lake below Kalispell. Power and irrigation facilities are supplied by the Kerr Dam (completed 1958) near Polson at the south end of the lake. The University of Montana Biological Station is on the eastern shore.

Flathead River, river rising in the MacDonald Range in southeastern British Columbia, Can., and flowing south for 240 miles (385 km) across the Canada-United States boundary into Montana. After passing between the Whitefish Range (west) and Glacier National Park and the Lewis Range (east), it enters Flathead Lake and emerges from the lake to join the Clark Fork near Paradise, Mont. Its chief tributaries are the Middle Fork, which rises near the Continental Divide and flows 85 miles (137 km) northwest to join the main stream north of Coram; and the South Fork, which flows 80 miles (129 km) north-northwest from the Flathead National Forest past the Flathead Range to join the main stream via the Hungry Horse Dam and Reservoir. The Flathead Valley is a resort region with diversified farming and fruit growing, lumbering, and mining.

flatulence, the presence of excessive amounts of gas in the stomach or intestine, which sometimes results in the expulsion of the gas through the anus. Healthy individuals produce significant amounts of intestinal gas (flatus) daily; without rectal release, gases trapped within the digestive system produce bloating and abdominal distention. Although a normal occurrence, flatulence sometimes causes embarrassment because of the sound and fetid odour of the gases.

Intestinal gas comes from either swallowed air (nitrogen and oxygen) or the fermentation by bacteria of poorly digested carbohydrates in the colon, yielding a mixture of carbon dioxide, hydrogen, and methane. All the common intestinal gases are odourless; about 1 percent of the flatus consists of a mixture of other gases that causes the distinctive odour. Foods with high proportions of nondigestible carbohydrates, such as beans and other legumes, are associated with excessive flatulence; unusual flatulence not associated with specific dietary causes may indicate intestinal malabsorption or other disease processes.

flatware, spoons, forks, and serving implements used at the table. The term flatware

was introduced toward the end of the 19th century. Strictly speaking, it excludes knives, which are classified as cutlery (*q.v.*), although in common American usage knives are generally included.

In the earliest spoons, baked clay formed both the bowl-shaped receptacle portion and the supporting stem or handle. Later, spoons were made from suitably shaped bone or wood pieces. The Egyptians fashioned spoons of bronze, some having spiked handles to extract snails from their shells. Elaborate cosmetic spoons had carved handles representing human or animal forms; long incense spoons served ceremonial functions. Both the Greeks and Romans employed bronze and sometimes silver for spoons. Some Roman spoons, made of bone, had small holes in the centres of their bowls; the purpose of these holes is not known. In western Europe the Celts used short bronze spoons with broad shanks formed to fit the hand.

As knowledge of techniques spread, cutlery production was established in areas able to offer plentiful timber to heat furnaces and provide charcoal, in addition to soft water for the hardening and tempering of steel.

Forks, which originally had a single point, were made with two prongs by the Romans. In the Middle Ages large forks with two flat prongs were used for serving. Smaller eating forks were gradually developed, replacing the traditional pair of pointed table knives that were part of the transition to knife and fork. Handles were sometimes made of precious or semiprecious materials.

Silver spoons originally had long, pointed bowls, but by the later Middle Ages the bowls were frequently fig-shaped, while the stems were often topped with decorative knobs. Matching sets of spoons and forks in standard patterns were common by the mid-18th century. The modern tablespoon, with its stem ending in a rounded curve and turned downward, was adopted about 1760. Although by the late 17th century individual eating knives were no longer carried for ordinary use, sets consisting of knife, fork, spoon, and drinking vessel were still being made for travelers well into the 19th century.

Sheffield plate (*q.v.*) was employed between 1750 and 1880 for such items as knife handles, serving dishes, tea urns, and candelabra; it was manufactured mainly in Sheffield, Eng., but also in Birmingham, Eng. By about 1860 the new process of electroplating (*q.v.*) su-

perseded the fusion process used in Sheffield plate. The electroplating of silver onto alloys of nickel and copper was soon common and was followed by the plating of nickel onto brass. Sheffield plate ceased to be commercially manufactured, and surviving pieces eventually became valuable antiques.

Though since about 1860 much flatware has been silver-plated by the electroplating method, the use of stainless steel for tableware has grown steadily since 1920. Ferritic stainless steel, containing 12 percent chromium, is used for less costly flatware, particularly in East Asia. The larger spoons and forks intended for use in food preparation are frequently made of stainless steel.

Other flatware materials include gold for luxury services and unplated nickel alloys, aluminum, tin-coated iron, and plastics for inexpensive ones. Wood and natural horn are popular for salad servers. Aluminum is especially useful where lightness and low cost are desired; lightweight plastic eating implements are produced for picnic sets, ice cream spoons, and airline food service. The least expensive materials for metal flatware are regular steels electroplated with copper, nickel, or chromium.

Silver-plated flatware is manufactured by electroplating silver onto a base metal such as finely buffed nickel silver (an alloy consisting mainly of copper, zinc, and nickel) or stainless steel, its quality being determined by the strength and composition of the base metal, the standard of finish, and the thickness of the silver deposit.

Solid-silver flatware, utilizing essentially pure silver, is a luxury item. Standards for silver purity vary, the principal one being not less than 925 parts of fine silver in 1,000 parts, established by the British assay offices for silver hallmarked as "sterling." The balance is copper or other base metals that add strength to the finished piece. Similar controls exist in many other European countries, although some nations accept a lower standard of 800 parts of silver in 1,000 parts. In Europe silver articles usually bear hallmarks indicating that the metal contains a prescribed amount of silver. Other marks record the year of manufacture and the maker. In the United States the word sterling when used by a reputable supplier is accepted as a sufficient guarantee, and there are no fixed standards.

Modern flatware is produced in all the cutting centres of the world. During the 20th century the processes used in its manufacture reached a high degree of mechanization. The metal, carefully refined, is formed into sheets

of proper thickness and is cut into strips of the required width. These processes involve the strictest control of metal behaviour and correct annealing to remove excessive strains. The strips are fed into machine presses that cut out each spoon or fork in its rough shape, one end being at first almost square for a spoon and rectangular for a fork. The ends of these "blanks" are rolled again in a direction at right angles to the centre line, reducing the thickness at this point without altering the thickness of the handle. The bowls of the more expensive spoons are no more than half as thick as their handles.

After being trimmed, the blanks are stamped in alloy-steel dies that hollow the bowls and stamp a pattern on the handles. In the case of forks, slots are cut out to form the prongs, which are then stamped in dies to the required curvature, tapered, and pointed on abrasive belts. These processes are approximately the same whatever metal is used, although in manufacturing cheaper products, made from thinner sheets, cross-rolling can be omitted and the stamping can be performed in one operation.

Subsequent finishing processes vary according to the metal used. In the case of silver, successively finer stages of buffing prepare the surfaces for final polishing or satin finishing. In the case of alloys that are to be electroplated, the articles, after being buffed, are wired individually on frames; quantities of 100 or more can be immersed simultaneously in the series of cleaning baths and plating vats. In most factories the complete frames carrying many articles are transferred automatically from baths to vats and finally to washing and drying. The thickness of the electroplated deposit is increased by some makers at the points of maximum wear; for example, on the centre of the convex surface of spoon bowls. Although the electroplated deposit of silver is specified in grams or pennyweights per dozen pieces and sometimes in actual thickness in millimetres or thousandths of an inch, the more popular method of indication is use of the terms "30 years," "25 years," or "20 years" plate. The designation A1 is considered satisfactory as a guarantee of quality if given by a manufacturer of good repute.

After the pieces have been electroplated, their surfaces are dull and require polishing. Hand polishing is performed by holding the articles upon rapidly rotating mops dressed with an aluminum compound or rouge. The least expensive plating process is "bright plating," in which a very thin coating of silver or chromium is deposited bright, thus eliminating final polishing. Such coatings are of short duration, and the process is therefore restricted to the cheaper grades of flatware. Stainless steel is more difficult to polish than silver, silver plate, or unplated nickel alloys. Techniques have been developed for stamping the cheaper varieties of stainless-steel spoons and forks from prepolished sheet. In some countries stainless steel is polished electrolytically.

flatworm, also called PLATYHELMINTH, any of a phylum (Platyhelminthes) of soft-bodied, usually much-flattened worms, including both free-living and parasitic species.

A brief treatment of flatworms follows. For a full treatment, see MACROPAEDIA: Flatworms.

Flatworms occur in a variety of marine, freshwater, and terrestrial habitats and are widely distributed throughout the world. Flatworms, which range in length from a fraction of a millimetre to 15 m (50 feet), are of three main types: turbellarians, which include the planarian (see planarian), trematodes (see fluke), and cestodes (see tapeworm).

Flatworms are bilaterally symmetrical and are usually flattened in appearance; they lack respiratory, skeletal, and circulatory systems and a body cavity (coelom). Spaces between

the organs of the nonsegmented body are filled with solid connective tissue (mesenchyme).

Flatworms of the class Turbellaria are mostly free-swimming; some live in or on a host, usually in an aquatic environment. Many are broad and leaflike, but some are cylindrical. All are covered with cilia (tiny hairlike structures) that are in constant motion. All trematodes are parasitic. Fish are the most common hosts, but all vertebrate classes are parasitized

Prostheceraeus, a flatworm of the class Turbellaria
 Jacques Six

by them. About 35 species are known to parasitize humans. Some have one host during their lifetime, others two or more. All cestodes are internal parasites. They have no mouth or gut, and food is absorbed through the body wall.

Flaubert, Gustave (b. Dec. 12, 1821, Rouen, Fr.—d. May 8, 1880, Croisset), novelist regarded as the prime mover of the realist school of French literature and best known for his masterpiece, *Madame Bovary* (1857), a realistic portrayal of bourgeois life, which led to a trial on charges of the novel's alleged immorality.

Early life and works. Flaubert's father, Achille Cléophas Flaubert, who was from Champagne, was chief surgeon and clinical professor at the Hôtel-Dieu hospital in Rouen. His mother, a doctor's daughter from Pont l'Évêque, belonged to a family of distinguished magistrates typical of the great provincial bourgeoisie.

Gustave Flaubert began his literary career at school, his first published work appearing in a little review, *Le Colibri*, in 1837. He early formed a close friendship with the young philosopher Alfred Le Poittevin, whose pessimistic outlook had a strong influence on him. No less strong was the impression made by the company of great surgeons and the environment of hospitals, operating theatres, and anatomy classes, with which his father's profession brought him into contact.

Flaubert, detail of a drawing by E.F. von Liphart, 1880; in the Bibliothèque Municipale, Rouen, Fr.

Flaubert's intelligence, moreover, was sharpened in a general sense. He conceived a strong dislike of accepted ideas (*idées reçues*), of which he was to compile a "dictionary" for his amusement. He and Le Poittevin invented a grotesque imaginary character, called "le Garçon" (the Boy), to whom they attributed whatever sort of remark seemed to them most degrading. Flaubert came to detest the "bourgeois," by which he meant anyone who "has a low way of thinking."

In November 1841 Flaubert was enrolled as a student at the Faculty of Law in Paris. At the age of 22, however, he was recognized to be suffering from a nervous disease that was taken to be epilepsy, although the essential symptoms were absent. This made him give up the study of law, with the result that henceforth he could devote all his time to literature. His father died in January 1846, and his beloved sister Caroline died in the following March after giving birth to a daughter. Flaubert then retired with his mother and his infant niece to his estate at Croisset, near Rouen, on the Seine. He was to spend nearly all the rest of his life there.

On a visit to Paris in July 1846, at the sculptor James Pradier's studio, Flaubert met the poet Louise Colet. She became his mistress, but their relationship did not run smoothly. His self-protecting independence and her jealousy made separation inevitable, and they parted in 1855.

In 1847 Flaubert went on a walking tour along the Loire and the coast of Brittany with the writer Maxime du Camp, whose acquaintance he had made as a law student. The pages written by Flaubert in their journal of this tour "over fields and shores" were published after his death under that title, *Par les champs et par les grèves*. This book contains some of his best writing—e.g., his description of a visit to Chateaubriand's family estate, Combourg.

Mature career. Some of the works of Flaubert's maturity dealt with subjects on which he had tried to write earlier. At the age of 16, for instance, he completed the manuscript of *Mémoires d'un fou* ("Memoirs of a Mad Man"), which recounted his devastating passion for Elisa Schlésinger, 11 years his senior and the wife of a music publisher, whom he had met in 1836. This passion was only revealed to her 35 years later when she was a widow. Elisa provided the model for the character Marie Arnoux in the novel *L'Éducation sentimentale*. Before receiving its definitive form, however, this work was to be rewritten in two distinct intermediate versions in manuscript: *Novembre* (1842) and a preliminary draft entitled *L'Éducation sentimentale* (1843–45). Stage by stage it was expanded into a vast panorama of France under the July Monarchy—indispensable reading, according to Georges Sorel, for any historian studying the period that preceded the coup d'état of 1851.

The composition of *La Tentation de Saint Antoine* provides another example of that tenacity in the pursuit of perfection that made Flaubert go back constantly to work on subjects without ever being satisfied with the results. In 1839 he was writing *Smarh*, the first product of his bold ambition to give French literature its *Faust*. He resumed the task in 1846–49, in 1856, and in 1870, and finally published the book as *La Tentation de Saint Antoine* in 1874. The four versions show how the author's ideas changed in the course of time. The version of 1849, influenced by Spinoza's philosophy, is nihilistic in its conclusion. In the second version the writing is less diffuse, but the substance remains the same. The third version shows a respect for religious feeling that was not present in the earlier ones,

since in the interval Flaubert had read Herbert Spencer and reconciled the Spencerian notion of the Unknown with his Spinozism. He had come to believe that science and religion, instead of conflicting, are rather the two poles of thought. The published version incorporated a catalog of errors in the field of the Unknown (just as *Bouvard et Pécuchet* was to contain a list of errors in the field of science).

From November 1849 to April 1851 Flaubert was travelling in Egypt, Palestine, Syria, Turkey, Greece, and Italy with Maxime du Camp. Before leaving, however, he wanted to finish *La Tentation* and to submit it to his friend the poet Louis Bouilhet and to du Camp for their sincere opinion. For three days in September 1849 he read his manuscript to them, and they then condemned it mercilessly. "Throw it all into the fire, and let's never mention it again." Bouilhet gave further advice: "Your Muse must be kept on bread and water or lyricism will kill her. Write a down-to-earth novel like Balzac's *Parents pauvres*. The story of Delamare, for instance. . . ."

Eugène Delamare was a country doctor in Normandy who died of grief after being deceived and ruined by his wife, Delphine (*née* Couturier). The story, in fact that of *Madame Bovary*, is not the only source of that novel. Another was the manuscript *Mémoires de Mme Ludovica*, discovered by Gabrielle Leleu in the library of Rouen in 1946. This is an account of the adventures and misfortunes of Louise Pradier (*née* d'Arctet), the wife of the sculptor James Pradier, as dictated by herself, and, apart from the suicide, it bears a strong resemblance to the story of Emma Bovary. Flaubert, out of kindness as well as out of professional curiosity, had continued to see Louise Pradier when the "bourgeois" were ostracizing her as a fallen woman, and she must have given him her strange document. Even so, when inquisitive people asked him who served as model for his heroine, Flaubert replied, "Madame Bovary is myself." As early as 1837 he had written *Passion et vertu*, a short and pointed story with a heroine, Mazza, resembling Emma Bovary. For *Madame Bovary* he took a commonplace story of adultery and made of it a book that will always be read because of its profound humanity. While working on his novel Flaubert wrote: "My poor Bovary suffers and cries in more than a score of villages in France at this very moment." *Madame Bovary*, with its unrelenting objectivity—by which Flaubert meant the dispassionate recording of every trait or incident that could illuminate the psychology of his characters and their role in the logical development of his story—marks the beginning of a new age in literature.

Madame Bovary cost the author five years of hard work. Du Camp, who had founded the periodical *Revue de Paris*, urged him to make haste, but he would not. The novel, with the subtitle *Mœurs de province* ("Provincial Customs"), eventually appeared in installments in the *Revue* from Oct. 1 to Dec. 15, 1856. The French government then brought the author to trial on the ground of his novel's alleged immorality, and he narrowly escaped conviction (January–February 1857). The same tribunal found the poet Charles Baudelaire guilty on the same charge six months later.

To refresh himself after his long application to the dull world of the bourgeoisie in *Madame Bovary*, Flaubert immediately began work on *Salammô*, a novel about ancient Carthage, in which he set his sombre story of Hamilcar's daughter Salammô, an entirely fictitious character, against the authentic historical background of the revolt of the mercenaries against Carthage in 240–237 bc. His transformation of the dry record of Polybius into richly poetic prose is comparable to Shakespeare's treatment of Plutarch's narrative in the lyrical descriptions in *Antony and Cleopatra*. A play, *Le Château des coeurs*

(*The Castle of Hearts*, 1904), written in 1863, was not printed until 1880.

Later years. The merits of *L'Éducation sentimentale*, which appeared a few months before the outbreak of the Franco-German War of 1870, were not appreciated, and Flaubert was much disappointed. Two plays, *Le Sexe faible* ("The Feeble Sex") and *Le Candidat* (*The Candidate*, 1904), likewise had no success, though the latter was staged for four performances in March 1874. The last years of his life, moreover, were saddened by financial troubles. In 1875 his niece Caroline's husband, Ernest Commanville, a timber importer, found himself heavily in debt. Flaubert sacrificed his own fortune to save him from bankruptcy. Flaubert sought consolation in his work and in the friendship of George Sand, Ivan Turgenev, and younger novelists—Émile Zola, Alphonse Daudet, and, especially, Guy de Maupassant, who was the son of his friend Alfred Le Poittevin's sister Laure and who regarded himself as Flaubert's disciple.

Flaubert temporarily abandoned work on a long novel, *Bouvard et Pécuchet*, in order to write *Trois Contes*, containing the three short stories "Un Coeur simple," a tale about the drab and simple life of a faithful servant; "La Légende de Saint Julien l'Hospitalier"; and "Hérodiade." This book, through the diversity of the stories' themes, shows Flaubert's talent in all its aspects and has often been held to be his masterpiece.

The heroes of *Bouvard et Pécuchet* are two clerks who receive a legacy and retire to the country together. Not knowing how to use their leisure, they busy themselves with one abortive experiment after another and plunge successively into scientific farming, archaeology, chemistry, and historiography, as well as taking an abandoned child into their care. Everything goes wrong because their futile book learning cannot compensate for their lack of judgment.

The profound meaning of *Bouvard et Pécuchet*, which was left unfinished by Flaubert and which was not published until after his death, has been seriously misunderstood by those critics who have regarded it as a denial of the value of science. In fact it is "scientism" (and by analogy the confusion of doctrines) that Flaubert is arraigning—i.e., the practice of taking science out of its own domain, of confusing efficient and final causes, and of convincing oneself that one understands fundamentals when one has not even grasped the superficial phenomena. Intoxicated with empty words, Bouvard and Pécuchet awake from their dream only when catastrophe overtakes all of their efforts.

Flaubert has been accused of presenting them as imbeciles, but in fact he expresses his compassion for them: "They acquire a faculty deserving of pity, they recognize stupidity and can no longer tolerate it. Through their inquisitiveness their understanding grows; having had more ideas, they suffered more." Flaubert's satire is thus to some extent the history of his own experience told with a sad humour.

Flaubert died suddenly of an apoplectic stroke. He left on his table an unfinished page and notes for the second volume of his novel. Bouvard and Pécuchet, tired of experimenting, were to go back to the work of transcribing and copying that they had done as clerks. The matter that they chose to transcribe was the subject of the notes: it was to be a selection of quotations, a *sottisier*, or anthology of foolish remarks. There has been much controversy about this bitter conclusion, as the form that it was to take was left undetermined in the notes Flaubert left, though the materials were gathered and have been published.

Method of composition. Flaubert's aim in art was to create beauty, and this consideration often overrode moral and social issues in his depiction of truth. He worked slowly and carefully, and, as he worked, his idea of his

art became gradually more exact. His letters to Louise Colet, written while he was working on *Madame Bovary*, show how his attitude changed. His ambition was to achieve a style "as rhythmical as verse and as precise as the language of science" (letter of April 24, 1852). In his view "the faster the word sticks to the thought, the more beautiful is the effect." He often repeated that there was no such thing as a synonym and that a writer had to track down *le seul mot juste*, "the unique right word," to convey his thought precisely. But at the same time he always wanted a cadence and a harmony of sounding syllables in his prose, so that it would appeal not only to the reader's intelligence but also to his subconscious mind in the same way as music does and thus have a more penetrating effect than the mere sense of the words at their face value. Composition for him was a real anguish.

Flaubert sought objectivity above all else in his writing: "The author, in his work, must be like God in the Universe, present everywhere and visible nowhere." It is paradoxical, therefore, that his personality should be so clearly discernible in all his work and that his letters, written casually to his intimates and full of disarming sincerity, delicate sensibility, and even exquisite tenderness—side by side with jovial coarseness of expression—should be considered by some critics as his masterpiece. (R. Dum./J. Ba.)

MAJOR WORKS. *Novels. Madame Bovary, Moeurs de province*, 2 vol. (1857), notable translations are those by Gerard Hopkins (1949) and F. Steegmuller (1957); *Salammô* (1862; *Salambo*, trans. by E. Powys Mathers, new ed., 1950); *L'Éducation sentimentale: Histoire d'un jeune homme*, 2 vol. (1870; *Sentimental Education*, trans. by Robert Baldick, 1964); *La Tentation de Saint Antoine* (1874; *The First Temptation of Saint Anthony*, trans. from the version of 1856 by René Francis, new ed., 1924; *The Temptation of Saint Anthony*, trans. by Lafcadio Hearn, new ed., 1932); *Trois Contes* ("Un Cœur simple," "La Légende de Saint Julien l'Hospitalier," and "Hérodiade," 1877; *Three Tales*, trans. by Robert Baldick, 1961); *Bouvard et Pérecqet: Oeuvre posthume* (1881; *Bouvard and Pérecqet*, trans. by T.W. Earp and G.W. Stonier, 1936, reprinted 1979); *Novembre* (1928; Eng. trans. 1932).

Plays. Le Candidat (1874); *Le Château des coeurs* (1885).

Other works. Par les champs et par les grèves (1886); *Le Dictionnaire des idées reçues* (1913; *Flaubert's Dictionary of Accepted Ideas*, trans. by Jacques Barzun, 1954); *Bibliomanie* (1926; Eng. trans. 1929).

BIBLIOGRAPHY. The definitive text of Flaubert's novels, short stories, and travel notes is the critical edition, 12 vol. (1938–46), by René Dumesnil, which gives variant readings and an introduction and annotations. For Flaubert's juvenilia and for his plays, reference may be made to the Conard edition, 9 vol. (1926–33), and to the *Supplément à la correspondance générale*, 4 vol. (1954), ed. by René Dumesnil, Jean Pommier, and Claude Digeon. *The Letters of Gustave Flaubert, 1830–1857* (1980), ed. by Francis Steegmuller, is the broadest and most varied selection in English.

The standard biography is René Dumesnil, *Gustave Flaubert: l'homme et l'oeuvre* (1932); for a record in English of his life, see P. Spencer, *Flaubert: A Biography* (1952). Flaubert's passion for Elisa Schléssinger is the subject of E. Gerard-Gailly, *L'Unique passion de Flaubert* (1932) and *Le Grand amour de Flaubert* (1944). A.A. Bertrand, *Gustave Flaubert et ses amis* (1927), gives an account of Flaubert's significant relationships with contemporary writers and thinkers.

Of the many critical works on Flaubert, the following 19th-century studies are especially recommended: P. Bourget, *Essais de psychologie contemporaine* (1920); and F. Brunetière, *Le Roman naturaliste* (1896). The novelist's work is put into historical perspective in L. Degoumois, *Flaubert à l'école de Goethe* (1925); F. Mauriac, *Trois grands hommes devant Dieu* (1930), compares Flaubert to Molière and Rousseau. A. Thibaudet, *Gustave Flaubert* (1935), and E. Maynial, *Flaubert* (1943),

combine biography with critical chapters on the major works and on style and aesthetics.

There have been a great number of studies that deal with the individual works by Flaubert, but among the more modern general criticism are: V.H. Brombert, *The Novels of Flaubert* (1966); Stratton Buck, *Gustave Flaubert* (1966); and B.F. Bart, *Flaubert* (1967). Enid Starkie, *Flaubert: The Making of the Master* (1967), is a penetrating analysis. Jean-Paul Sartre, *L'Idiot de la famille: Gustave Flaubert*, 2 vol. (1971), is a study of the novelist, whom the writer uses as a tool for his own dissection of France's bourgeoisie.

flauto piccolo (musical instrument): see piccolo.

Flavian I of Antioch (b. c. 320, probably Antioch, Syria—d. 404), bishop of Antioch from 381 to 404, whose election perpetuated the schism originated by Meletius of Antioch (*q.v.*), a crucial division in the Eastern Church over the nature of the Trinity.

With his friend Diodorus, later bishop of Tarsus (Tur.), Flavian defended the Nicene Creed against Arianism (*q.v.*). In 360 Bishop St. Meletius was appointed to the see of Antioch (whose bishop, St. Eustathius, had been banished for opposing Arianism); there his unexpected profession of Nicene orthodoxy caused him to be exiled several times. During Meletius' absences, Flavian and Diodorus administered his see. But the churchmen who remained devoted to Eustathius formed a faction—destined to resist Meletius' authority—and made Paulinus their bishop, causing the Meletian Schism.

Flavian succeeded Meletius (381), and Paulinus appointed as his own successor Evagrius, the last bishop of the Eustathian faction. Recognition of Flavian as legitimate bishop of Antioch was at first withheld by Pope St. Siricius, but his position was secured in 398/399 through the intervention of Patriarch St. John Chrysostom of Constantinople and the influence of the Roman emperor Theodosius I the Great. Nevertheless, some Eustathians continued in schism until 414.

Flavian II of Antioch (d. c. 518, Petra, Arabia), patriarch of Antioch probably from 498 to 512. He was chosen patriarch by the emperor Anastasius I after he accepted the evasive Henoticon, the decree of union between the Monophysites (*q.v.*) and the Orthodox. In deference to orthodoxy, however, Flavian would not expressly repudiate the Council of Chalcedon. This equivocal policy only antagonized both sides, particularly the Monophysites. At the synod of Sidon (511) Flavian maintained his position, but soon afterward, under constant harassment by his enemies, he yielded finally to their demand for a rejection of Chalcedon. Forced to abdicate, he was banished to Petra in Arabia.

Flavian DYNASTY (AD 69–96), the ancient Roman imperial dynasty of Vespasian (reigned 69–79) and his sons Titus (79–81) and Domitian (81–96); they belonged to the Flavia gens.

The fall of Nero (AD 68) and the extinction of the Julio-Claudian dynasty had been followed by a war of succession that revealed the military basis of the principate and the weakness of the tie connecting the emperor with Rome. The successive emperors Galba, Otho, Vitellius, and Vespasian represented in turn the legions of Spain, the Praetorian Guard (the household troops), the Army of the Rhine, and a coalition of the armies of the Danube and the Euphrates; and all except Otho were already *de facto* emperors when they entered Rome. The final survivor in the struggle, Vespasian, was a man of comparatively humble origin; and, because the principate ceased to possess the prestige of high descent, it became necessary to remove, as far as possible, the anomalies of the office and to give it a legitimate and permanent form. There were several results: an elaborate and

formal system of titles was substituted for the personal names of the Julio-Claudian emperors; there was an increasing tendency to insist on the inherent prerogatives of the principate (such as the censorial power); and there was an attempt to invest Caesarism with a hereditary character, either by natural descent or by adoption. Moreover, the worship of the *Divi*, or deified Caesars, was made the symbol of imperial continuity and legitimacy.

Vespasian's reign was noted for his reorganization of the army, making it more loyal and professional; for his expansion of the membership of the Senate, bringing in administrators with a sense of service; for his increase and systematization of taxation; and for his strengthening of the frontiers of the empire (though little new territory was added). Titus' brief but popular reign was followed by the autocracy of Domitian, who fought the senatorial class and instituted taxes and confiscations for costly buildings, games, and shows. A final reign of terror (89–96) was ended by his assassination. The Flavian dynasty was succeeded by the era of the Five Good Emperors.

Flavian, SAINT (d. Aug. 11, 449, Hypaepa, Lydia; feast day February 18), patriarch of Constantinople from 446 to 449, who opposed the heretical doctrine of the Monophysites (*q.v.*). He presided at the Synod of Constantinople (448), which condemned the monk Eutyches (*q.v.*), proponent of an extreme form of Monophysitism. Pope St. Leo I the Great approved the synod's action in his famous *Tome* (449). Patriarch Dioscorus of Alexandria, on behalf of Eutyches, influenced the Eastern Roman emperor Theodosius II to summon the Robber Synod of Ephesus (Aug. 8, 449), which exonerated Eutyches and deposed Flavian, whose opponents beat him to death three days later.

The Council of Chalcedon (451) vindicated him, proclaiming him a martyr and saint.

Flavian Amphitheatre: see Colosseum.

Flavigny, Marie-Catherine-Sophie de: see Agoult, Marie-Catherine-Sophie de Flavigny, comtesse d'.

flavin, also called **LYCHROME**, any of a group of pale-yellow, greenly fluorescent biological pigments (biochromes) widely distributed in small quantities in plant and animal tissues. Flavins are synthesized only by bacteria, yeasts, and green plants; for this reason, animals are dependent on plant sources for them, including riboflavin (vitamin B₂), the most prevalent member of the group.

Flavius (ancient Roman personal name, or praenomen): see under gens or family name or honorific (*e.g.*, under Severus for Flavius Valerius Severus).

Flavius, Gnaeus (late 4th century BC), Roman legal writer and politician who made public the technical rules of legal procedure, which had been kept secret by the patricians and the pontifices (advisers to the king, dictator, or emperor) so that they could maintain their advantage over the plebeians. Flavius learned procedure while serving as secretary to Appius Claudius Caecus, censor and later consul. In about 304 he published his findings, which became known as the *Jus Flavianum*. From this work the Roman people for the first time could learn the *legis actiones*, or verbal formulas required to maintain legal proceedings, and the *dies fasti*, or specified days on which proceedings could be instituted.

His resulting popularity caused him to be chosen for several public offices, including that of senator. In 304 he was made curule aedile (magistrate of public buildings and works) over the protests of the nobles, who

despised him because he had weakened their power and because he was lowborn, the son of a freedman.

flavonoid, also called FLAVONE, any of a class of nonnitrogenous biological pigments (biochromes) that includes the anthocyanins and the anthoxanthins. Extensively represented in plants, the flavonoids are of relatively minor and limited occurrence in animals, which derive the pigments from plants. Many members of this group, notably the anthoxanthins, impart yellow colours, often to the petals of flowers. The anthocyanins are largely responsible for the red colouring of buds and young shoots as well as for the purple and purple-red colours of autumn leaves. Although no physiological functions have been definitely established for the flavonoids, it has been suggested that the colour they impart to flowers may be an important factor in attracting bees, butterflies, and other pollen-transferring animals that implement fertilization in plants. Similarly, brightly coloured fruits have improved chances of seed dispersal by animals attracted to them as food.

flavour, also spelled FLAVOR, in particle physics, property that distinguishes different members in the two groups of basic building blocks of matter, the quarks and the leptons. There are six flavours of subatomic particle within each of these two groups: six leptons (the electron, the muon, the tau, the electron-neutrino, the muon-neutrino, and the tau-neutrino); and six quarks (dubbed "up," "down," "charm," "strange," "top," and "bottom"; a particle containing the top quark has yet to be observed).

Flavour can change in particle reactions only through the agency of the weak nuclear force, as when, for example, a muon changes into an electron, or a neutron (containing two down quarks and one up quark) transmutes into a proton (made from two up quarks and one down quark). (Ch.Su.)

flavour, also spelled FLAVOR, in sensory perception, attribute of a substance (apart from its texture and temperature) that is produced by the senses of smell, taste, and touch and is perceived within the mouth. These sensations help to identify substances and are sources of enjoyment when eating and drinking.

Tasting occurs in the mouth, chiefly on the tongue through the taste buds. The taste buds are stimulated by four fundamental taste sensations—sweet, salty, sour, and bitter. Examples of substances that induce the four basic tastes are sugar (sweet), salt (salty), lemon juice (sour), and quinine (bitter). Substances can be tasted only when they are in water solutions, and if a substance is not in solution when taken into the mouth, it must be dissolved in saliva before it can be detected by the taste buds. The taste buds most sensitive to salty flavours are dispersed along the sides and front of the tongue. Taste buds sensitive to sweet flavours are concentrated on the tip of the tongue. Bitter flavours are detected at the rear of the tongue and sour flavours on the sides.

Smelling involves the olfactory nerve endings in the upper part of the interior of the nose. Aromas can reach these nerves either directly through the nostrils as in breathing or indirectly up the back passageway from the mouth. Because of their remote location, the olfactory nerve endings are best stimulated by "sniffing" through the nose or swallowing if food is in the mouth. Odours are smelled only when the material is in gaseous form—i.e., a dispersion of molecules in air.

Touch sensations that contribute to taste originate in the nose, lips, and throughout the entire mouth and throat. The touch sensa-

tions relating solely to taste are based on the chemical properties of the substance. Reactions induced by chemical properties include the coolness of peppermint, the "bite" of mustard and pepper, the warmth of cloves, and the astringency of spinach.

When a person consumes food, the simultaneous stimulation of the senses of taste, smell, and touch create an immediate impression that causes him to accept the food and continue eating it or to reject and discard it. Many foods such as bananas, berries, and other fruits, nuts, milk, and a few vegetables have flavours that make them highly acceptable in their natural, uncooked state. Other foods derive their flavour through cooking, seasoning, and flavouring or combinations of these. Psychologists have demonstrated that preference for or avoidance of a particular flavour is a learned behaviour.

Flavour evaluation tests are used by the food-processing industry to determine acceptability of new food products and to assure uniform quality of established products. Many tests rely on panels composed of trained tasters. Flavour tests include ranking and scoring, with panel members ranking samples according to intensity of the flavour characteristic being judged; profile methods, in which trained participants describe sensations produced by food samples; difference tests, with participants reporting differences detected in samples; and consumer acceptance testing, in which trained workers evaluate surveys of reactions of potential consumers to product samples.

In the late 20th century, scientists working with foods were developing objective methods for isolating and measuring the chemicals contributing to flavours. Knowledge of the chemicals involved and the conditions affecting them can lead to improvements in raw materials; quality evaluation and control; processing, storage, and preparation methods; and new-product development.

flavouring, also spelled FLAVORING, any of the liquid extracts, essences, and flavours that are added to foods to enhance their taste and aroma. Flavourings are prepared from essential oils, such as almond and lemon; from vanilla; from fresh fruits by expression; from ginger by extraction; from mixtures of essential oils and synthetic organic chemicals; or entirely from synthetic chemicals, with alcohol, glycerol, propylene glycol, alone or in combination, as solvents. Water is added and sometimes certified food colour as well.

Extracts, essences, and flavours employing only natural flavouring agents are called pure; those employing synthetics (in part or entirely) are called imitation, or artificial, flavourings.

Essential oils, which are complex substances derived from plants, consist of a number of organic chemical components such as alcohols, aldehydes, ethers, esters, hydrocarbons (terpenes, sesquiterpenes, etc.), ketones, lactones, phenols, and phenol ethers. Nearly all of these organic chemicals have been synthesized, and it is these synthetics that are used in the manufacture of imitation flavourings.

Essential-oil extracts. These extracts are prepared by dissolving an essential oil in alcohol of the proper strength, adding water and, where desirable and permitted by law, a small amount of certified food colour. They include almond, anise, celery, cassia or cinnamon, clove, lemon, nutmeg, orange, rosemary, savory, basil, sweet marjoram, thyme, and wintergreen.

Nonalcoholic flavouring extracts. Nonalcoholic flavouring extracts are prepared by employing glycerol or propylene glycol or a combination of these to bring the essential oil into solution, with added water, and sometimes food colour.

True fruit flavours. True fruit flavours are obtained by expression, concentration, or distillation of fresh fruits. The alcoholic content

of the finished product is usually between 18 and 22 percent to prevent fermentation.

Imitation, artificial extracts, essences, and flavours. Imitation, artificial extracts, essences, and flavours are prepared by bringing into solution with alcohol, glycerol, or propylene glycol various synthetic flavouring agents to formulate an extract, essence, or flavour with the likeness of the flavour of the fruit, spirit, or liqueur for which it is named. These preparations cover a wide range of flavourings including vanilla, lemon, lime, banana, cherry, butterscotch, brandy, and rum.

Some contain few ingredients, others many. Imitation vanilla extract may be prepared with synthetic vanillin, coumarin (now prohibited in the United States and Canada), heliotropin, glycerol, water, and caramel colouring.

Imitation strawberry flavour may contain 10, 12, or more synthetic organic chemicals including aldehyde C16, aldehyde C14, benzyl acetate, methyl anthranilate, amyl acetate, amyl butyrate, and ethyl propionate, with solvents and added colour, according to the particular manufacturer's art, skill, and experience in bringing out the fullest and most realistic flavour.

Imitation brandy flavour may contain, with other organic chemicals, ethyl oenanthatate, methyl succinate, ethyl acetate, and ethyl propionate.

Certain synthetic organic chemicals lend a distinctive note to imitation flavourings—for example, allyl caproate and ethyl butyrate to pineapple, benzaldehyde to almond, benzyl butyrate to raspberry, and citral to lemon.

flax (genus *Linum usitatissimum*), plant of the family Linaceae and its fibre, which is second in importance among the bast fibre (*q.v.*) group. The flax plant is cultivated both for its fibre, from which linen yarn and fabric are made, and for its seed, called linseed, from which linseed oil is obtained.

Flax is one of the oldest textile fibres. Evidence of its use has been found in the prehistoric lake dwellings of Switzerland. Fine linen

Flax (*Linum usitatissimum*)

fabrics, indicating a high degree of skill, have been discovered in ancient Egyptian tombs. Phoenician traders apparently brought linen from the Mediterranean area to Gaul and Britain, and the Romans introduced linen manufacture throughout their empire. In the 17th century the German states and Russia were major sources of raw material, and the linen industry was established in the United Provinces of the Netherlands, Ireland, England, and Scotland. In North America the expansion of the cotton industry reduced the importance of linen. Flax cultivation achieved importance in other areas, including Argentina and Japan, in the first half of the 20th century.

Flax is an herbaceous annual. When densely planted for fibre, plants average 0.9 to 1.2 metres (3 to 4 feet) in height, with slender stalks 2.5 to 4 millimetres (about 0.10 to 0.15 inch) in diameter and with branches concentrated at the top. Plants cultivated for seed are shorter and many-branched. The leaves, alternating on the stalk, are small and lance-shaped. The flowers, borne on stems growing from the branch tips, have five petals, usually blue in colour but sometimes white or pink. Small globular bolls, composed of five lobes, contain the seeds.

The plant, adaptable to a variety of soils and climates, grows best in well-drained, sandy loam and in temperate climates. In most areas planting of the same land with flax is limited to once in six years to avoid soil exhaustion. Cool, moist growing seasons produce the most desirable fibre. Harvesting usually takes place after the lower portion of the stalk has turned yellow but before the fruit is fully mature. The fibre is obtained by subjecting the stalks to a series of operations, including retting, drying, crushing, and beating.

Fibre colour ranges from buff to gray, with the best qualities creamy white. The fibre strands, which measure about 30 to 75 centimetres (12 to 30 inches) long, are made up of individual cylindrically shaped cells with fairly smooth surfaces.

Linen is valued for its strength, lustre, durability, and moisture absorbency. It is resistant to attack by microorganisms, and its smooth surface repels soil. It is stronger than cotton, dries more quickly, and is more slowly affected by exposure to sunlight. It can be bleached to a pure white but dyeing is somewhat difficult because the fibres are not readily penetrated. Although linen increases in strength when wet, the excessive use of alkalis in laundering can weaken the fibres. Low elasticity, imparting hard, smooth texture, also makes linen subject to wrinkling, which can be reduced by chemical treatment. Because linen absorbs and releases moisture quickly and is a good conductor of heat, linen garments have a cooling effect on the wearer.

Fine grades of linen are made into woven fabrics and laces for apparel and household furnishings. Lower grades are used for products requiring strength and ability to withstand moisture—such as canvas, twine, fire hose, bagging, industrial sewing thread, and fishnet. Leading producers include the Soviet Union, Poland, and Romania.

Flaxman, John (b. July 6, 1755, York, Yorkshire, Eng.—d. Dec. 7, 1826, London), sculptor, illustrator, and designer, the leading artist of the Neoclassical style in England.

As a youth, Flaxman worked in his father's plaster-casting studio in London while studying Classical literature, which was to be a continual source of inspiration. In 1770 he entered the Royal Academy schools. After 1775 he began to work for the potter Josiah Wedgwood. The discipline of producing designs, usually based on antique models and executed in wax, which could be translated into the silhouette technique of Wedgwood's jasperware, strengthened Flaxman's innate feeling for line. While at the academy he formed a lifelong friendship with William Blake, who stimulated his interest in Gothic art.

In 1787 he went to Rome and directed the Wedgwood studio there. Intending to stay only two years, he obtained enough commissions to remain until 1794. His artistic creed was formed in these years. He drew assiduously, not only from the antique but also from Italian medieval and Renaissance art, and was determined to give his work a moral purpose. Between 1790 and 1794 he produced ambitious and relatively unsuccessful groups such as "The Fury of Athamas" (Ickworth, Suffolk) and "Cephalus and Aurora" (Lady Lever Art Gallery, Port Sunlight), but his book illustra-

Monument to Agnes Cromwell by Flaxman, 1800; in the Chichester Cathedral, Sussex

tions had far greater importance. His *Iliad* and *Odyssey* (1793), *Aeschylus* (1795), and Dante's *Divine Comedy* (1802) soon became widely known and, with their clean linear rhythms, contributed much to the spread of Neoclassicism in England. Later in life he designed a *Hesiod*, engraved by William Blake in 1817.

On his return to London his designs for a large monument to the earl of Mansfield (Westminster Abbey, 1793–1801) established his reputation as a sculptor. He became a member of the Royal Academy in 1800 and its first professor of sculpture in 1810. The number of works produced after 1800 was enormous. They ranged from small monuments in relief to very large commissions in the round (the Nelson monument in St. Paul's Cathedral; 1808–18). He also made some designs for silversmiths, the most famous being "The Shield of Achilles" (1818).

Flaxman's chief strength lies in his sincerity and the remarkable fecundity of his designs, which include figures in the Classical manner and in contemporary dress. In his own day his reputation as a sculptor rivalled those of his great contemporaries Antonio Canova and Bertel Thorvaldsen.

flea, a member of one of 1,600 species and subspecies of small, wingless, blood-sucking insects of the order Siphonaptera. The order is divided into three superfamilies. Fleas are

Flea (*Ctenocephalides*)
William E. Ferguson

found from the Arctic Circle to the Arabian deserts. Specialized anatomical structures allow the flea to attach itself to the skin of mammals or birds and consume their blood. In the process of moving from host to host, fleas may transmit a number of serious human and animal diseases.

A brief treatment of fleas follows. For full treatment, see *MACROPAEDIA: Insects*.

The adult flea varies in length from 1 to 10 millimetres (0.04 to 0.4 inch) and lives from a few weeks to more than a year. Powerful leg muscles enable fleas to jump distances up to 200 times their body length, developing an acceleration of more than 200 gravities. (This great strength allows fleas to pull miniature carts and perform other stunts in "flea circuses.") Although a detailed life cycle is known for only a few species, in general it is known to consist of four stages. The female flea deposits small white eggs on the host's body or in its nest or other habitat. From these eggs very small, legless larvae emerge. In the larval stage the flea consumes bits of dried excrement or blood, flakes of skin, or a special blood-rich fecal matter provided by its parents. After three, or sometimes two, molts, the larva spins a cocoon and enters the pupal stage. The metamorphosis of pupa to adult occurs in this cocoon over the course of days or months.

On emerging from its cocoon, the adult flea seeks a vertebrate host. The anatomical structures that distinguish Siphonaptera from other groups function primarily as aids to its ectoparasitic feeding habits. Its compressed body and backward-projecting spines ensure swift movement through the hair or feathers of its host, while the mouthparts, modified for piercing and sucking, include barbed stylets that facilitate skin penetration and tenacious attachment to host tissue.

Some fleas, such as the rabbit fleas and the shrew fleas, infest only one particular host species, while others are at home on a wide range of hosts. *Ctenocephalides felis*, the cat flea, feeds on cats, dogs, foxes, civets, mongooses, opossums, and, when these species are not available, even on humans. Related mammals, even if geographically separated, are often parasitized by closely related flea species. The most heavily afflicted mammalian group is the rodents, including rats, mice, and squirrels, while horses and most other ungulates, monkeys, and apes are largely free of flea infestation. The European rabbit flea (*Spilopsyllus cuniculi*) has been discovered to exhibit a life cycle closely matched to the hormonal cycles of its host.

The Siphonaptera are believed to be descended from an ancestor of the Mecoptera, an order of primitive carnivorous insects that includes the scorpionflies. A fossil flea found in Australia has been claimed to be 200,000–300,000 years old. The known fossil fleas do not differ significantly from modern fleas.

The consequences of flea infestation are of considerable medical and economic importance. The ectoparasitic action of fleas can cause severe inflammation and itching and, in heavy infestation of animals, can lead to serious damage or death through loss of blood. More important than these parasitic effects is the role of fleas as carriers of human and animal diseases. As the principle transmission agent of bubonic plague, the Oriental rat flea (*Xenopsylla cheopis*) and related species were instrumental in the epidemics that caused the death of a fourth of Europe's population in the Middle Ages. As plague-infected rats succumb to the disease, their contaminated parasites seek fresh hosts, which in crowded conditions may include humans. Occasional cases of plague are still reported in tropical regions,

but the disease is well controlled by diagnostic techniques and antibiotics. Murine typhus, a mild fever-producing disease of rodents, is transmitted to humans by *Xenopsylla cheopis* and other fleas. Fleas are also the carriers of myxomatosis, a viral disease of rabbits, deliberately introduced to rabbit populations in Australia and other areas where the animals have become a serious pest. The transmission of some parasitic worms afflicting dogs and cats involves fleas.

flea beetle, any member of the insect subfamily Alticinae (Halticinae) belonging to the leaf beetle family Chrysomelidae (order Coleoptera). These tiny beetles, worldwide in distribution, are usually less than 6 millimetres (0.25 inch) in length and dark or metallic in colour. The enlarged hindlegs are adapted for jumping. Flea beetles are important pests of cultivated plants: the adults feed on the leaves and the larvae on the roots. Some flea beetles carry plant diseases (e.g., early potato blight).

The grape flea beetle (*Altica chalybea*), 4 to 5 mm long and dark steel-blue in colour, eats grape buds in early spring; both the adults and larvae feed on grape leaves in the summer. They can be controlled by spraying an arsenical poison on the grape leaves.

Alligatorweed flea beetle (*Agasicles hygrophila*), adult and eggs
William E. Ferguson

The striped flea beetle (*Phyllotreta striolata*) infests cabbage and similar plants. The cucumber beetle (*Epitrix cucumeris*) feeds on cucumbers and melon vines, *E. hirtipennis* attacks tobacco plants, and *E. fuscula* eats tomatoes and potatoes.

fleabane, any of the plants of the genus *Erigeron* of the family Asteraceae, order Asterales, containing about 200 species of annual, biennial, and perennial herbs native primarily to temperate parts of the world. Some species are cultivated as rock garden or border ornamentals, especially *E. alpinus*, *E. annuus*, *E. aurantiacus*, *E. karvinskianus*, and *E. spectosus*.

Fleabanes resemble plants of the genus *Aster* but have several rows of ray flowers and many overlapping bracts (leaflike structures) below the flower heads. The disk flowers of the solitary or clustered flower heads are yellow; the ray flowers are yellow, purple, pink, or white. Some species have short stems and basal leaves; others are taller, with leaves that alter-

nate along the stem and often are lobed, toothed, or hairy.

flèche, in French architecture, any spire; in English it is an architectural term for a small slender spire placed on the ridge of a church roof. The flèche is usually built of a wood framework covered with lead or occasionally copper and is generally of rich, light, delicate design, in which tracery, miniature buttresses, and crockets have important parts.

Flèche at the intersection of the nave and the transepts, Amiens cathedral, France, 1220-c. 1270
GEKS

Flèches are frequently of great height, that of Notre-Dame, Paris, being nearly 100 feet (30 metres) and that of Amiens 148 feet (45 metres). The flèche is usually placed at the intersection of the nave and transepts.

Fleetwood, Charles (b. c. 1618, Aldwinkle, Northamptonshire, Eng.—d. Oct. 4, 1692, Stoke Newington, Middlesex), English Parliamentary general, son-in-law and supporter of Oliver Cromwell.

He joined the Parliamentary army at the beginning of the Civil War between Parliament and King Charles I and fought in the major Parliamentary victories at Naseby (June 1645), Dunbar (September 1650), and Worcester (September 1651). By 1650 Fleetwood was lieutenant general of cavalry, but his major military contribution was in planning the organization of the Parliamentary armies. In 1651 he married Cromwell's daughter, Bridget, and from 1652 to 1655 he was commander in chief and lord deputy in Ireland, where he carried out a policy of repression.

Fleetwood was one of the generals who helped Cromwell govern England from 1655 to 1657, though he opposed the plan to make Cromwell king. After the Lord Protector's death in September 1658, Fleetwood led the group of officers who deposed Cromwell's ineffectual son Richard (May 1659). He had a hand in restoring the Rump Parliament—dissolved in 1653—but when it tried to remove him as commander in chief, he helped dissolve it once again (October 1659). Gen. George Monck then invaded England from Scotland, reinstated Parliament, and replaced Fleetwood as head of the army. When Charles II returned to England in May 1660, Fleetwood was permanently excluded from public office.

Flegel, Eduard Robert (b. Oct. 13, 1855, Vilna, Lithuania, Russian Empire—d. Sept. 11, 1886, Brass, Nigeria), German explorer in Africa who was the first European to reach the source of the Benue River.

In 1879 Flegel travelled about 525 miles (845 kilometres) up the Benue River and in 1880 went by way of the Niger to Sokoto, in northwestern Nigeria, where he obtained permission from the Sultan for an expedition to the

Flegel, engraving
Interfoto-Friedrich Rauch, Munich

Adamawa Plateau. In the course of exploring the Benue Basin (1882-84), he reached the Benue's source, near Ngaoundéré, now in Cameroon. After a short stay in Europe, Flegel returned to Africa in April 1885 with a commission to open up the Niger and Benue basins to German commercial influence and thus prevent British ascendancy in that region. He was, however, unsuccessful and died the following year.

Fleischer, Nat, byname of NATHANIEL STANLEY FLEISCHER (b. Nov. 3, 1887, New York, N.Y., U.S.—d. June 25, 1972, Atlantic Beach, N.Y.), American sports journalist who was an outstanding authority on boxing.

Fleischer, a sportswriter for the *New York Press*, was encouraged by the promoter Tex Rickard to found the authoritative monthly magazine *The Ring*, the first issue of which appeared in February 1922. In 1942 he published the first annual *Ring Record Book and Boxing Encyclopedia*. He was the author of more than 50 books on boxing and wrestling.

Fleischer, Max; and Fleischer, Dave (respectively, b. July 19, 1883, Vienna, Austria—d. Sept. 11, 1972, Woodland Hills, Calif., U.S.; b. July 14, 1894, New York, N.Y.—d. June 25, 1979, Hollywood, Calif.), American animated-cartoon producers of such characters as Betty Boop and Popeye. The Fleischers were considered Walt Disney's main rivals in the 1930s.

The Fleischer brothers, sons of Austrian immigrants, completed their first animated film in 1915. The mechanically inclined Max invented the rotoscope, a time- and labour-saving device in which live-action film frames are traced as a guide for animated action. This device was used for the character Ko-Ko the Clown, who starred in the *Out of the Inkwell* series (1919-29). The Fleischers' most famous original character was Betty Boop, a quintessential flapper girl who made her debut in the 1930 short *Dizzy Dishes*.

The cinematic world of the Fleischer cartoons in the mid-1930s was urban, gritty, and obsessed with sex and death; it was the opposite of Disney's bright, rural, and colourful image of the world. The short *Bimbo's Initiation* (1931)—in which Betty Boop's dog, Bimbo, is subjected to a series of unspeakable tortures at the hands of a quasi-Masonic underground organization (whose members sport chamber pots on their heads)—is an example of the Fleischers' quirky perverseness. In Disney films, the animation is story- and character-driven, whereas in Fleischer films, story and characterization are subservient to frequently grotesque visual and verbal gags.

The Fleischers' most successful series featured Popeye, a squinty-eyed, gravel-voiced sailor created by comic strip artist E.C. Segar. The character was introduced in 1933 and proved to be the mainstay of the Fleischer studio throughout the decade. The suggestiveness

of the Fleischers' cartoons was tamed by the onset of the moralistic Production Code in 1934; by the end of the decade, their work increasingly resembled Disney's. They released the animated features *Gulliver's Travels* (1939) and *Mr. Bug Goes to Town* (1941; also released as *Hoppity Goes to Town*), as well as a moderately successful *Superman* series in the early 1940s, before financial losses resulted in the takeover of the Fleischer studio by Paramount Pictures. Max went on to produce educational films and television cartoons, and Dave supervised animation at Columbia and Universal studios.

Flémalle, Master of (fl. c. 1430), an unknown Flemish painter and leading artist of the northern Renaissance, whose work is characterized by naturalistic and sculptural conceptions that signalize the replacement of the decorative International Style of the late Mid-

"Virgin and Child," by the Master of Flémalle

By courtesy of the Städtisches Kunstinstitut Frankfurt am Main, Ger. photograph. Verlag Joachim Blauel

de Ages. By the late 20th century, after several decades of controversy, a growing number of scholars attributed the works of the Master of Flémalle to the Flemish painter Robert Campin (q.v.).

Fleming, Sir Alexander (b. Aug. 6, 1881, Lochfield, Ayr, Scot.—d. March 11, 1955, London, Eng.), Scottish bacteriologist whose discovery of penicillin (1928) prepared the way for the highly effective practice of antibiotic therapy for infectious diseases. Fleming shared the Nobel Prize for Physiology or Medicine in 1945 with Ernst Boris Chain and Howard Walter Florey, who both (from 1939) carried Fleming's basic discovery further in the isolation, purification, testing, and quantity production of penicillin.

After taking his degree at St. Mary's Hospital Medical School, London University (1906), Fleming conducted experiments to discover antibacterial substances that would be nontoxic to human tissues. He continued his research while serving with distinction in the Royal Army Medical Corps in World War I. In 1918 he returned to research and teaching at St. Mary's; he became Hunterian professor (1919) and Arris and Gale lecturer (1928) at the Royal College of Surgeons.

In 1921 Fleming identified and isolated lysozyme, an enzyme found in certain animal

Sir Alexander Fleming

© Hulton Getty

tissues and secretions, such as tears and saliva, that exhibits antibiotic activity. While working with *Staphylococcus* bacteria in 1928, Fleming noticed a bacteria-free circle around a mold growth (spores of *Penicillium notatum*) that was contaminating a culture of the staphylococci. Investigating, he found a substance in the mold that prevented growth of the bacteria even when it was diluted 800 times. He called it penicillin. Fleming found that penicillin is nontoxic but that it inhibits the growth of many types of disease-causing bacteria. He was aware of the significance of his discovery, but he lacked the necessary chemical means to isolate and identify the active compound involved. He was thus unable to obtain a sufficient quantity of penicillin for use on humans. It was not until 12 years later, during World War II, that the pressing need for new antibacterial drugs provided the impetus for Chain and Florey's active development of penicillin.

Fleming was elected a fellow of the Royal Society in 1943 and knighted in 1944.

Fleming, Ian, in full IAN LANCASTER FLEMING (b. May 28, 1908, London, Eng.—d. Aug. 12, 1964, Canterbury, Kent), suspense-fiction novelist whose character James Bond, the stylish, high-living British secret service agent 007, became one of the most successful and widely imitated heroes of 20th-century popular fiction.

The son of a Conservative MP and the grandson of a Scottish banker, Fleming was born into a family of wealth and privilege. He was educated in England, Germany, and Switzerland, and before settling down as a full-time writer, Fleming was a journalist in Moscow (1929–33), a banker and stockbroker (1935–39), a high-ranking officer in British naval intelligence during World War II, and foreign manager of the London *Sunday Times* (1945–59).

Casino Royale (1953) was the first of his 12 James Bond novels, and with its opening line—"The scent and smoke and sweat of a casino are nauseating at three in the morning"—the Bond phenomenon was born. Packed with violent action, hairbreadth escapes, international espionage, terror, and intrigue, the books sold more than 18 million copies and were translated into 11 languages. The Bond books became widely popular in the United States after the newly elected president, John F. Kennedy, named a Bond novel on his list of favourite books in March 1961.

Bond, with his propensity for gambling and fast cars, became the prototype of the handsome, clever, playboy-hero of the late 1950s and '60s. He was the symbol in the West of the burgeoning consumer age. He indulged in only the best brand-name products, and he enjoyed access to the foremost electronic gadgets

of his day. To some readers, Bond's incessant name-dropping of commercial products was off-putting, but the tactic enabled Fleming to create a realism unusual in popular fiction of his day. Bond's mannerisms and quirks, from the way he liked his martinis ("shaken, not stirred") to the way he introduced himself ("Bond, James Bond"), soon became famous around the world. All of the Bond novels, notably *From Russia, with Love* (1957), *Dr. No* (1958), *Goldfinger* (1959), and *Thunderball* (1961), were made into popular motion pictures, although many deviated from Fleming's original plots.

Fleming's books were roundly criticized by many high-brow critics and novelists. Paul Johnson lambasted the Bond phenomenon in a famous essay titled "Sex, Snobbery, and Sadism," and David Cornwell (the spy novelist John Le Carré) criticized Bond's immorality ("He's a sort of licensed criminal who, in the name of false patriotism, approves of nasty crimes"). Feminists have long objected to Bond's chauvinistic ways, while the Soviet Union, as the enemy in so many of Bond's Cold War capers, attacked Fleming for creating "a world where the laws are written with a pistol barrel." Fleming countered that "Bond is not a hero, nor is he depicted as being very likeable or admirable . . . He's not a bad man, but he is ruthless and self-indulgent. He enjoys the fight—he also enjoys the prizes."

Despite (or because of) such criticism, the Bond stories grew in popularity. The 007 trademark became one of the most successful in merchandising history, giving birth in the 1960s to a spate of Bond-related products, from toys and games to clothes and toiletries. James Bond films continued into the 21st century, and they have reportedly grossed over \$1 billion; the book series has continued as well, under new writers. There are hundreds of Bond-related Internet sites and fan clubs around the world.

Fleming also published two collections of short stories featuring Bond. In addition, he wrote a children's book, *Chitty-Chitty-Bang-Bang* (1964), which, too, was made into a feature film. Fleming's life and personality—from his wartime service, his caving and shark hunting, to his and his family's hobnobbing with the rich and famous (when Fleming's father died, Winston Churchill wrote the obituary)—made him, in the opinion of many, a more compelling figure than even Bond, and as such he has been the subject of several biographies, such as Andrew Lycett's *Ian Fleming* (1995).

In the end, Fleming's life philosophy was perhaps best summarized not by Bond but by Commander Pott, who in *Chitty-Chitty-Bang-Bang* instructs his children, "Never say 'no' to adventures. Always say 'yes,' otherwise you'll lead a very dull life."

Fleming, Sir John Ambrose (b. Nov. 29, 1849, Lancaster, Lancashire, Eng.—d. April 18, 1945, Sidmouth, Devon), English engineer who made numerous contributions to electronics, photometry, electric measurements, and wireless telegraphy.

After studying at University College, London, and at Cambridge University under James Clerk Maxwell, Fleming became a consultant to the Edison Electric Light Company in London, an adviser to the Marconi Wireless Telegraph Company, and a popular teacher at University College (1885–1926), where he was the first to hold the title of professor of electrical engineering.

Early in his career Fleming investigated photometry, worked with high-voltage alternating currents, and designed some of the first electric lighting for ships. He is best remembered as the inventor of the two-electrode radio rec-

tifier, which he called the thermionic valve; it is also known as the vacuum diode, kenotron, thermionic tube, and Fleming valve. This device, patented in 1904, was the first electronic rectifier of radio waves, converting alternating-current radio signals into weak direct currents detectable by a telephone receiver. Augmented by the amplifier grid invented in 1906 by Lee De Forest of the United States, Fleming's invention was the ancestor of multielectrode vacuum tubes. Fleming was knighted in 1929.

Fleming, Peggy, in full PEGGY GALE FLEMING (b. July 27, 1948, San Jose, Calif., U.S.), American ice figure skater who dominated world women's amateur competition from 1964 through 1968.

At the age of 15 she won the first of five consecutive U.S. Senior Ladies' championships. In the North American title competition, she finished second (1965) and then first (1967). She won the world championship three consecutive years (1966 through 1968), and in the 1968 Olympic Winter Games she won a gold medal. After turning professional in 1968, she performed with the *Ice Capades* and other skating shows.

Fleming, Sir Sandford (b. Jan. 7, 1827, Kirkcaldy, Fife, Scot.—d. July 22, 1915, Halifax, Nova Scotia, Can.), civil engineer and scientist who was the foremost railway engineer of Canada in the 19th century.

Fleming emigrated in 1845 from Scotland to Canada, where he was trained as an engineer. In 1863 he was chosen by the Canadian government to conduct a survey for a proposed railway to run from the Atlantic to the Pacific. He became chief engineer for the construction of the resulting Intercolonial Railway (also part of the Canadian National Railway). In 1871 he became engineer-in-chief of the proposed Canadian Pacific Railway, and the routes he surveyed through the Kicking Horse and other passes greatly aided Canadian railway construction in the ensuing decades. Fleming retired from his post in 1880.

Fleming then served as chancellor (1880–1915) of Queen's University in Kingston, Ont., and devoted himself to scientific projects and writing. Railway travel had rendered obsolete the old practice wherein different regions set their clocks according to local astronomical conditions. In studying solutions to this problem, Fleming suggested a standard, or mean, time with hourly variations from it according to a system of time zones. His efforts were instrumental in the convening (1884) of the International Prime Meridian Conference in Washington, D.C., at which the current internationally accepted system of time zones was adopted. Fleming was also an advocate of a telegraph communication system for the British Empire, the first link of which was a Pacific cable between Canada and Australia (1902). He was knighted in 1897.

Fleming, Victor (b. Feb. 23, 1883, Pasadena, Calif., U.S.—d. Jan. 6, 1949, near Cottonwood, Ariz.), one of Hollywood's most popular motion-picture directors during the 1930s. With producer David O. Selznick, he was responsible for completing *Gone with the Wind* (1939).

Fleming started in the industry as a stunt car driver in 1910, later doing camera work for D.W. Griffith. Serving in the photographic section during World War I, he acted as chief photographer for President Woodrow Wilson at Versailles, France. Fleming was later associated with Metro-Goldwyn-Mayer and 20th Century-Fox studios, where he made his reputation by guiding such actors as Clark Gable and Spencer Tracy to stardom.

Fleming directed his first feature film, *When the Clouds Roll By*, in 1919, and he soon be-

came famous for creating highly charged scenes full of dramatic action. His early popular sound films *Red Dust* (1932) and *Treasure Island* (1934) were followed by the classic *The Wizard of Oz* (1939), in which Fleming artfully combined fantasy and realism. Fleming's later films included *Dr. Jekyll and Mr. Hyde* (1941), *Tortilla Flat* (1942), *A Guy Named Joe* (1943), and *Joan of Arc* (1948).

Fleming, Williamina Paton Stevens, née STEVENS (b. May 15, 1857, Dundee, Tayside, Scot.—d. May 21, 1911, Boston, Mass., U.S.), American astronomer who pioneered in the classification of stellar spectra.

She married James Orr Fleming in 1877, but the marriage proved to be unhappy. In 1878 she immigrated to Boston, and the following year she became the housekeeper of Edward C. Pickering, director of the Harvard College Observatory. She joined his research staff in 1881. For the next 30 years she collaborated on the analysis of stellar spectrum photography, and in 1898 she was appointed curator of astronomical photographs at Harvard.

Fleming is best known for her work on the classification of stellar spectra—the pattern of lines caused by the dispersion of a star's light through a prism placed before a telescope lens. Using a technique that came to be known as the Pickering-Fleming system, she studied the tens of thousands of celestial photographs taken for the Draper Memorial—a project dedicated to the amateur astronomer Henry Draper of New York. In the course of her work she discovered 10 novae, 52 nebulae, and hundreds of variable stars. She also established the first photographic standards of magnitude used to measure the variable brightness of stars. In 1906 Fleming became the first American woman elected to the Royal Astronomical Society.

Fleming and Walloon, members of the two predominant cultural and linguistic groups of modern Belgium. The Flemings, who numbered about 6 million in the late 20th century, speak Netherlandic (Flemish) and live mainly in the north and west. The Walloons, numbering about 3,300,000, speak dialects of French and live in the south and east. The vast majority of both groups are Roman Catholic.

Originally, the area of Belgium was a part of Gaul in Roman times and was inhabited by Romanized Celts. Gradually the land was infiltrated by Gothic Germans, until finally in the 3rd and 4th centuries AD, a new wave of Germans, the Salic Franks, began pressing down from the northeast. Eventually they pushed back the Romans and took up a line generally corresponding to the present north-south division between Flemings and Walloons, a natural line of formerly dense forests. Only later, in the 5th century, after the withdrawal of the Roman frontier garrisons, did many Franks push on southward and settle much of Gaul proper. The northern Franks retained their Germanic language (which became modern Netherlandic), whereas the Franks moving south rapidly adopted the language of the culturally dominant Romanized Gauls, the language that would become French. The language frontier between northern Flemings and southern Walloons has remained virtually unchanged ever since.

This linguistic boundary is minutely demarcated by law and passes roughly east-west across north-central Belgium on a line just south of the capital city, Brussels. North of the line, all public signs and government publications must be in Flemish, which has official status; the same situation prevails for French south of the line. In Brussels, which is officially bilingual, all signs and publications must be in both languages.

Much of the history of modern Belgium consists of the struggle of the country's Flemish-speaking community to gain equal status for its language and to acquire its fair share of po-

litical influence and economic opportunity in a society that was dominated largely by Walloons after the country achieved independence in 1830. In the 20th century the Flemings were successful in obtaining legislation to further these aims, but their linguistic and other differences with the Walloons remained a source of occasional social friction.

Flemish art, art of the 15th, 16th, and early 17th centuries in Flanders, known for its vibrant materialism and unsurpassed technical skill. From the van Eycks through Bruegel to Rubens, the Flemish painters were masters of the oil medium and used it primarily to portray a robust and realistically detailed vision of the world around them. Their paintings reflect clearly the changes in fortune of this narrow slice of country between France, Germany, and the Low Countries: first came the peaceful, pious, and prosperous 15th-century reigns of the dukes of Burgundy; then a long confused succession of religious crises and civil wars; and finally the imposition of autocratic rule by the kings of Spain.

The precursors of the Flemish school are usually placed in Dijon, the first capital of the dukes of Burgundy. Philip the Bold (reigned 1363–1404) established the powerful Flemish-Burgundian alliance that lasted more than a century—until 1482. He also established a tradition of art patronage that was to last nearly as long. Among the artists he attracted to Dijon were the sculptor Claus Sluter of Haarlem and the painter Melchior Broderlam of Ypres, in whose works one can see the attachment to the world of surface appearances that is so characteristic of the Flemish school.

Philip the Good (reigned 1419–67) moved the Burgundian capital to Brugge (Bruges), centre of the northern wool trade, transforming that city into an artistic centre. In 1425 Philip officially employed Jan van Eyck as his painter. The major works of van Eyck—"The Ghent Altarpiece" (1432; St. Bavo, Ghent), "The Madonna of Chancellor Rolin" (1432; Louvre, Paris), and "Giovanni Arnolfini and His Bride" (1434; National Gallery, London)—are astonishing in that they are both the beginning and the culmination of early Flemish painting. Van Eyck is credited by the art historian Giorgio Vasari with the invention of oil painting but if so it is an invention that began at the peak of technical perfection, for no succeeding painter's works have so well maintained their freshness of surface and brilliance of colour. Van Eyck's artistic vision, static and formal though it is, also has maintained its power, imbuing everything he painted with a spiritual presence, for all his unbridled love of material appearances.

While continuing to embellish their works with brilliant colour and richly textured surfaces, the following generation of painters wisely did not attempt to imitate van Eyck but looked to Italy for advances in pictorial structure. In his masterpiece, "The Escorial Deposition" (1435; Escorial, Madrid), Rogier van der Weyden focused on the drama of the scene, eliminating the extraneous. Petrus Christus explored the underlying physical structure of his human subjects, giving them a strangely geometric appearance; and Dirck Bouts was the first Flemish painter to accurately use one-point perspective and to proportion his figures to their surroundings. These innovations, however, were extraneous to the spirit of the early Flemish tradition, which inevitably declined along with the self-assurance and religious convictions of the Flemish burghers, caught as they were in the late 15th century by the fall of the house of Burgundy and the economic collapse of Brugge. Of the late masters of early Flemish art, Hugo van der Goeck went mad, and Hans Memling and Gerard David produced melancholy, sometimes insipid pastiches of earlier works.

More in tune with the spiritual crisis that racked the continent at century's end were the bizarre allegories painted by Hieronymus Bosch. In his three-paneled "Garden of Earthly Delights" (c. 1500; Prado, Madrid), mankind moves in swarms from paradise to perversion to punishment, acting out myriad fantasies of sensual gratification.

The turbulent 16th century in Flanders was not hospitable to art and produced only one great master, Pieter Bruegel. It is in Bruegel's powerful portrayals of peasant life that one finds best reflected the brutality of the age. Bruegel, influenced by Bosch and educated by a two-year sojourn in Italy, developed a robust style marked by structural solidity, rhythmic sweep, and an ironic moralizing eye for the grotesque. Bruegel left behind two sons, Pieter the Younger, also called Hell Brueghel because of his paintings of damnation, and Jan Brueghel, called Velvet Brueghel, who devoted himself to still-life painting.

In that capacity Jan Brueghel assisted in the flourishing workshop of the great master of the Flemish Baroque, Peter Paul Rubens. Rubens showed an unrivaled mastery of the oil medium, creating for the monarchs of France and Spain fluid, luminous works of great energy and power. The works of his early maturity, such as "The Elevation of the Cross" (1610; Antwerp Cathedral), show evidence of careful study of the Italian masters Michelangelo, Tintoretto, and Caravaggio, but these works also have a rippling, silky surface and an animal vitality wholly Flemish in character. Rubens' mature allegorical style, exemplified by his cycle of paintings memorializing the career of Marie de Médicis, queen of France (1622-25; Louvre, Paris), was ideally suited to the ostentatious tastes of the Baroque age. In these exuberant works, fleshy classical deities, swirling from the air and bounding from the sea, watch over many events of Marie's life. Rubens' studio became a training ground for many Flemish painters, among them Anthony van Dyck, a child prodigy who later became famous as a court portrait painter in England; Frans Snyder, a still-life specialist; and David Teniers the Elder and Adriaen Brouwer, both known chiefly for their paintings of carousing peasants.

Flemish bond, also called **DUTCH BOND**, in masonry, method of bonding bricks or stones in courses. *See* bond.

Flemish Brabant, Flemish **VLAAMS-BRABANT**, province, north-central Belgium. Flemish Brabant surrounds the Brussels-Capital Region (containing the city of Brussels) but is administratively separate from it. It was created in 1995 when the province of Brabant was divided into Flemish Brabant and Walloon Brabant provinces and the Brussels-Capital region. Flemish Brabant is divided into two *arrondissements*: Hal-Vilvoorde to the west and Leuven (Louvain) to the east. The provincial capital is Leuven.

Flemish Brabant occupies part of the low, undulating Central Plateau, which rises from about 60 feet (18 m) above sea level in the north to 456 feet (139 m) in the south. The main rivers of the eastern Schelde River basin, the Senne (Zenne), Dijle, and Gete, flow in a northeast direction until each is picked up by the east-west line of the Demer-Dijle-Rupel river system, which flows to the lower Schelde.

The province's fertile, well-cultivated loams are of great agricultural importance. Large fields grow wheat and sugar beets, producing high yields through intensive use of fertilizers. Near Brussels there is market gardening, the raising of pigs and poultry, and the production of flowers and nursery plants. Northeast of the Brussels, in the Demer River valley, early vegetables are grown, while the Hageland is a fruit-growing region in the eastern part of the province. Cattle raising for both meat and dairy purposes is widespread. Some of the

province is wooded, the largest area being the Soignes Forest just southeast of Brussels.

Flemish Brabant is densely populated in its western portions, which are dominated by the Brussels metropolis and its industries and transport connections. Service industries predominate, but there are also various metallurgical, textile, and food-processing industries. The province's principal cities are Leuven, Tienen, Halle, and Vilvoorde. The province is served by the Charleroi-Brussels and Willebroek canals and by several rail lines fanning out from Brussels and Leuven. Area 813 square miles (2,106 square km). Pop. (1993 est.) 982,943.

Flemish language: *see* Netherlandic language.

Flemish movement, the 19th- and 20th-century nationalist movement of Flemish-speaking people in Belgium. It has sought political and cultural equality with, or separation from, the less numerous but long-dominant French-speaking Walloons. The movement had its origins in the 1830s; at first, under the leadership of the philologist Jan Frans Willems, it concentrated on the revival of the Flemish literary language. By the 1850s the movement put forth such political demands as separate Flemish and Walloon army units, introduction of Flemish in the administration and courts, and Flemish language instruction in schools and at the University of Ghent.

In the last decades of the century, the movement gained strength by its alliance with the Catholic People's Party. The Flemish literary language was already well developed by this time. Flemish was introduced into the administration and courts of the Flemish areas, and in 1898 it became the second official language of the country. In 1930, after a long struggle, Flemish became the sole language of instruction at the University of Ghent. In 1932 separate Flemish army units and a Flemish military academy were instituted. In the same year Flemish became the language of instruction in all primary and secondary schools in Flemish areas.

In the second half of the 20th century, as demographic predominance and political control shifted to the Flemings, the movement continued to press for further gains.

Flemish school (music): *see* Franco-Netherlandish school.

Flemming, Walther (b. April 21, 1843, Sachsenberg, Mecklenburg [now in Germany]—d. Aug. 4, 1905, Kiel, Ger.), German anatomist, a founder of the science of cytogenetics (the study of the cell's hereditary material, the chromosomes). He was the first to observe and describe systematically the behaviour of chromosomes in the cell nucleus during normal cell division (mitosis).

After serving as a military physician during the Franco-German War, Flemming held positions at the University of Prague (1873-76) and at the University of Kiel (1876-1901). A pioneer in the use of newly discovered aniline dyes to visualize cell structures, he found (1879) that a certain class of dyes revealed a threadlike material in the nucleus. Applying these stains to cells killed at different stages of division, he prepared a series of slides that, upon microscopic examination, clearly established the sequence of changes occurring in the nucleus during cell division. He showed that the threads (later called chromosomes) shortened and seemed to split longitudinally into two halves, each half moving to opposite sides of the cell. He named the entire process mitosis and described it in his historic book *Zell-substanz, Kern und Zelltheilung* (1882; "Cell-Substance, Nucleus, and Cell-Division"). The implications of Flemming's work for heredity were not fully appreciated until the recognition of Gregor Mendel's principles of heredity 20 years later.

Flensburg, Danish **FLENSBORG**, city, Schleswig-Holstein *Land* (state), a port at the head of Flensburg Fjord and Germany's most northerly large city. First mentioned in 1240, it was chartered in 1284 and was frequently pillaged by the Swedes after 1643. It became the capital of Schleswig under Danish rule in 1848 and was occupied by Prussia after the German-Danish War of 1864. In the plebiscite held in 1920, Flensburg voted to remain in Germany. The site of a naval station and

The harbour at Flensburg, Ger.

© Joachim Messerschmidt/Bruce Coleman Inc

academy before World War II, it again became a naval base after the establishment of West Germany.

Flensburg's notable landmarks include the medieval churches of St. Nicholas and St. Mary (1284), the large Nordertor (gate; 1595), the municipal museum, the Nordermarkt (North Market; 1595), and the German House concert hall. The adjacent Baltic resort of Glücksburg has a famous castle (1582-87) that was the seat of the ducal house of Schleswig-Holstein-Sonderburg-Glücksburg and was associated with the royal families of Denmark, Great Britain, Norway, and Greece. The German government under Admiral Karl Dönitz capitulated there to the Allies in May 1945.

Flensburg's industries include shipbuilding, metalworking, paper milling, and the production of rum and smoked eels. Pop. (1994 est.) 87,994.

flesh fly, a member of any species of the insect family Sarcophagidae (order Diptera) characterized by blackish stripes on the gray thorax (region behind the head) and a checkered pattern of light and dark gray on the abdomen. Most flesh flies are tropical, although the family is generally widespread.

Flesh fly (*Sarcophaga*)

E.S. Ross

Many species are scavengers with the female depositing immature forms (larvae) on carrion instead of eggs.

Other members are insect parasites. One of the best-known species (*Sarcophaga kellyi*) is a grasshopper parasite. The female deposits larvae, or maggots, on the underside of a grasshopper's wings. The maggots burrow into,

and feed on, its internal organs; they enter a resting stage (pupa) in the soil. Another *Sarcophaga* species develops in the pitcher plant as it feeds on trapped insects. The large gray fly, *Wohlfahrtia vigil*, found in the cooler regions of North America, is usually a mammal parasite and may deposit its young on the skin of infants. Other species deposit eggs in wasp or bee nests.

fleshy school of poetry, a group of late 19th-century English poets associated with Dante Gabriel Rossetti. The term was invented by the Scottish author Robert Williams Buchanan and appeared as the title of an article in the *Contemporary Review* (October 1871) in which he castigated the poetry of Rossetti and his colleagues, notably Algernon Swinburne, for its "... morbid deviation from the healthy forms of life..." In Buchanan's view, these poets exhibited "... weary wasting, yet exquisite sensuality; nothing virile, nothing tender, nothing completely sane; a superfluity of extreme sensibility..." Rossetti replied with "The Stealthy School of Criticism" in *The Athenaeum*, December 1871, and Swinburne with a pamphlet, "Under the Microscope," in 1872. The controversy was prolonged and distressed Rossetti, but it had ended before Rossetti's death in 1882, when Buchanan dedicated his novel *God and the Man* to him.

Fletcher, Alice Cunningham (b. March 15, 1838, Havana—d. April 6, 1923, Washington, D.C.), U.S. anthropologist whose stature as a social scientist, notably for her pioneer study of Indian music, has overshadowed her influence on federal government Indian policies that later were considered to be unfortunate.

Concern for the welfare of American Indians led Fletcher in the 1870s to study archaeology and ethnology at the Peabody Museum, Harvard University. In 1881 she went to Nebraska and began living with the Omaha tribe. Her subsequent efforts to improve the lot of the Indian reflected a missionary zeal and a paternalism toward Indians that was characteristic of the 19th century.

Concerned that the Omaha were about to be dispossessed, Fletcher went to Washington in 1882, drafted a bill to apportion Omaha tribal lands into individual Indian holdings, and successfully lobbied for its passage in Congress. Appointed by Pres. Chester A. Arthur to supervise the apportioning, she completed granting the land parcels in 1884 with the assistance of a young clerk in the Indian Bureau, Francis La Flesche. The son of the principal Omaha chief, La Flesche lived with her as her adoptive son (unlegalized) and collaborated with her in her Indian studies.

Fletcher went to Alaska and the Aleutian Islands to study educational needs in 1886. Her tireless championing of Indian welfare was instrumental in the passage of the Dawes General Allotment Act (1887), which further apportioned remaining tribal lands and provided for eventual citizenship for Indians. Though viewed as humanitarian at the time of its enactment, the Dawes Act came to be regarded by many as a cause of the exploitation and decline of Indian culture.

In the years following, Fletcher conducted land apportionment among the Winnebago and Nez Percé Indians and wrote *Indian Story and Song from North America* (1900) and *The Hako: A Pawnee Ceremony* (1904). Her major work is thought to be *The Omaha Tribe* (1911), an exhaustive study written with Francis La Flesche.

Fletcher, Giles, THE ELDER (b. c. 1548, Cranbrook, Kent, Eng.—buried March 11, 1611, London), English poet and author, and father of the poets Phineas and Giles Fletcher;

his writings include an interesting account of his visit to Russia.

Educated at Eton and at King's College, Cambridge, Fletcher was employed on diplomatic service in Scotland, Germany, and Holland. In 1588 he was sent to Russia to the court of the tsar, Fyodor I, with instructions to conclude an alliance between England and Russia, to restore English trade, and to obtain better conditions for the English Muscovy Company. He returned to England in 1589 and in 1591 published *Of the Russe Common Wealth*, a comprehensive account of Russian geography, government, law, methods of warfare, church, and manners. In 1610 Fletcher was employed to negotiate with Denmark on behalf of the merchants of the Eastland Company.

Of the Russe Common Wealth was issued in an abridged form in Richard Hakluyt's *The principal Navigations, Voyages, Traffiques and Discoveries* (2nd ed., 1598); in *Purchas His Pilgrimes* (1625); and also as *History of Russia* in 1643. Modern editions of it appeared in 1964 and 1966.

Fletcher, Giles, THE YOUNGER (b. c. 1585, London—d. 1623, Alderton, Suffolk, Eng.), English poet principally known for his great Baroque devotional poem *Christ's Victorie*.

He was the younger son of Giles Fletcher, the Elder. He was educated at Westminster School and at Trinity College, Cambridge. After his ordination, he held a college position, and became known for his sermons at the Church of St. Mary the Great. He left Cambridge about 1618 and soon after received the rectory of Alderton, Suffolk.

The theme of Fletcher's masterpiece, *Christ's Victorie, and Triumph in Heaven, and Earth, over, and after death* (1610), bears some resemblance to that of the religious epic *Semaine* (1578; Eng. trans., *Devine Weekes and Workes*, 1605) of the French Protestant poet Du Bartas; but the devotion, the passionate lyricism, and the exquisite vision of paradise that critics have praised are Fletcher's own. The poem is written in eight-line stanzas somewhat derivative of Edmund Spenser, of whom, like his brother Phineas, Giles was a disciple.

Fletcher, Harvey (b. Sept. 11, 1884, Provo, Utah, U.S.—d. July 23, 1981, Provo), U.S. physicist, a leading authority in the fields of psychoacoustics and acoustical engineering.

Harvey Fletcher

By courtesy of Brigham Young University, Provo, Utah

Fletcher was graduated from Brigham Young University, Salt Lake City, Utah, in 1907 and received a Ph.D. in physics from the University of Chicago in 1911. In 1916 he joined the staff of Bell Telephone Laboratories, where he worked for 33 years, primarily in the fields of speech, music, and hearing. Much of his work on the fundamentals of psychoacoustics is described in his book *Speech and Hearing* (1922).

Fletcher's research group developed and demonstrated two separate but related methods for reproducing sound: binaural sound reproduction and stereophonic reproduction.

He and his team gave the first public demonstration of stereophonic sound in 1934 in New York City. In 1949 he moved to Columbia University, where he established a department of acoustical engineering. In 1952 he was appointed director of research at Brigham Young University, becoming dean of the College of Physical Engineering Sciences (1954) and professor of physics (1958). In 1974 he became professor emeritus, continuing his research in acoustics until a few weeks before his death.

Fletcher, John (baptized Dec. 20, 1579, Rye, Sussex, Eng.—d. Aug. 29, 1625, London), English Jacobean dramatist who collaborated with Francis Beaumont and other dramatists on comedies and tragedies between about 1606 and 1625.

His father, Richard Fletcher, was minister of the parish in which John was born and became afterward queen's chaplain, dean of Peterborough, and bishop successively of Bristol, Worcester, and London, gaining a measure of fame as a tormenting accuser in the trial of Mary, Queen of Scots, and as the chaplain sternly officiating at her execution. When not quite 12, John was apparently admitted pensioner of Bene't (now Corpus Christi) College, Cambridge, and two years later became a Bible clerk. From the time of his father's death (1596) until 1607 nothing is known of him, although the evidence of his later plays indicates that he had not inherited his father's religious bigotry. His name is first linked with Beaumont's in Ben Jonson's *Volpone* (1607 quarto), to which both men contributed encomiums.

Fletcher began to work with Beaumont probably about 1607, at first for the Children

John Fletcher, engraving by George Vertue, 1729

of the Queen's Revels and its successor and then (from c. 1609 to 1610 until Beaumont's retirement in 1613 or 1614) mainly for the King's Men at the Globe and Blackfriars theatres. From about 1613 he was often assisted, or his plays were revised, by Philip Massinger, who succeeded him in 1625 as chief playwright of the King's Men; other collaborators included Nathaniel Field and William Rowley. Throughout his career he also wrote plays unaided. He died in the great London plague of 1625; he had lingered in the city to be measured for a suit of clothes instead of making his escape to the country.

The canon of the Beaumont and Fletcher plays is approximately represented by the 52 plays in the folio *Fifty Comedies and Tragedies*... (1679); but any consideration of the canon must omit one play from the 1679 folio (James Shirley's *Coronation*) and add three not to be found in it (*Henry VIII*, *Sir John van Olden Barnavelt*, *A very Woman*). Of these 54 plays not more than 14 are by Beaumont or by Beaumont and Fletcher in collaboration. The other 40 represent Fletcher either unaided or in collaboration with dramatists other than Beaumont, principally Massinger.

The masterpieces of the Beaumont and Fletcher collaboration—*Phylaster*, *The Maides Tragedy*, and *A King and No King*—show, most clearly in the last, the emergence of most of the features that distinguish the Fletcherian mode from that of Shakespeare, John Chapman, or John Webster: the remote, often pseudohistorical, fairy-tale setting; the clear, smooth speech rising to great emotional arias of declamatory rhetoric; the basically sensational or bizarre plot that faces the characters with wild “either-or” choices between extremes and that can be manipulated toward a sad or a happy ending as the playwrights choose; the sacrifice of consistency and plausibility in characterization so that patterns can be made out of constantly shifting emotional states and piquant situations can be prolonged.

Of Fletcher's unaided plays, six illustrate most completely the middle kind that he had perfected: *The Mad Lover*, *The Loyall Subject*, *The Humorous Lieutenant*, *Women pleas'd*, *The Island Princesse*, *A Wife for a Moneth* (all between c. 1616 and c. 1624). Each of these is a series of extraordinary situations and extreme attitudes, displayed through intense declamations. The best of the six are perhaps *The Loyall Subject* and *A Wife for a Moneth*, the latter a florid and loquacious play, in which a bizarre sexual situation is handled with cunning piquancy, and the personages illustrate clearly Fletcher's tendency to make his men and women personifications of vices and virtues rather than individuals. The best of Fletcher's comedies, for urbanity and consistency of tone, is probably *The Wild-Goose Chase*, a play of episodes rather than of intricate intrigue, but alive with irony and easy wit.

Lastly, there are the Fletcherian plays in which others besides Beaumont had a hand. *Wit at Several Weapons* is a comedy that might have been written wholly by Middleton; and *The Captaine* (to which Beaumont may, however, have contributed) is a lively, complex play of sexual intrigue, with tragic dilemmas too. Of the numerous plays in this group a preference may be expressed for *The False One* and *The Beggars Bush*. The former is an original, incisive, and moderately subtle treatment of the story of Caesar and Cleopatra, which may well have aided John Dryden to compose *All for Love* and for which the greater credit goes to Massinger. The latter is worth reading for its “version of pastoral” which genially persuades the audience that it is better to be a country beggar than a tyrannical king. But neither of these is representative of those features of the canon that modern criticism has most emphasized.

MAJOR WORKS. The dates of composition given here for the individual plays are largely conjectural.

Plays by Fletcher unaided. *The Faithfull Shepherdesse* (1608–09); *Valentinian* (1610–14); *Monsieur Thomas* (1610–16); *The Womans Prize* (?1611); *Bonduca* (1611–14); *The Mad Lover* (1616); *The Chances* (?1617); *The Loyall Subject* (1618); *Women pleas'd* (?1619); *The Island Princesse* (?1619–21); *The Humorous Lieutenant* (1619); *The Wild-Goose Chase* (1621); *The Pilgrim* (1621); *Rule a Wife And have a Wife* (1624); *A Wife for a Moneth* (1624).

Plays by Beaumont and Fletcher in collaboration. *The Woman Hater* (1606); *Phylaster* (1608–10); *The Coxcombe* (1608–10); *The Maides Tragedy* (1609–12); *The Captaine* (1609–12); *King and No King* (1611); *Cupids Revenge* (1611); *The Scornful Ladie* (1613–17); *Loves Pilgrimage* (?1616); *The Noble Gentleman* (c. 1625).

Plays by Beaumont, Fletcher, and Philip Massinger. *Thierry and Theodoret* (date of composition unknown, printed 1621); *The Beggars Bush* (?1622); *Loves Cure* (revised 1625).

Plays by Fletcher and Massinger. *The Little French Lawyer* (1619–23); *Sir John van Olden Barnavel* (1619); *The Custome of the Country* (1619); *The False One* (1620); *The double Marriage* (1621); *The Spanish Curat* (1622); *The Sea Voyage* (1622); *The Prophetesse* (1622); *The Lovers*

Progress (1623–34); *The Elder Brother* (1625); *A very Woman* (1625–34).

Plays by Fletcher with various other collaborators. Including plays written by Fletcher and Massinger together with a third and sometimes a fourth collaborator—with Shakespeare (no general agreement on these assignments but they probably represent majority opinion), *Henry VIII* (1613); *The Two Noble Kinsmen* (1613); with James Shirley, *The Night-Walker* (1633); with Nathaniel Field, *Foure Playes in One* (?1609–12); with Massinger and Field, *The Honest mans Fortune* (1613); *The Knight of Malta* (1616–18); *The Queene of Corinth* (1616–17); with an unknown reviser, *Wit With-Out Money* (1614); with Thomas Middleton, *The Nice Valour* (?1616); with William Rowley, *The Maid in the Mill* (1623); with John Ford, Massinger, and John Webster, *The Faire Maide of the Inne* (1626); with Massinger, Ben Jonson, and George Chapman, *The Bloody Brother, or, Rollo, Duke of Normandy* (?1617–30).

BIBLIOGRAPHY. *The Works . . .*, ed. by Arnold Glover and A.R. Waller, 10 vol. (1905–12, reprinted 1969), is the standard text, now being superseded by the edition of Fredson Bowers (ed.), *The Dramatic Works in the Beaumont and Fletcher Canon* (1966–). E.M. Waith, *The Pattern of Tragicomedie in Beaumont and Fletcher* (1952), claims that Beaumont and Fletcher significantly stylize experience and relates their work to the Roman art of declamation and to the classical *controversiae*; Ian Fletcher, *Beaumont and Fletcher* (1967), is a brief, appreciative monograph.

Fletcher, Phineas (baptized April 8, 1582, Cranbrook, Kent, Eng.—d. 1650, Hilgay, Norfolk), English poet best known for his religious and scientific poem *The Purple Island*.

He was the elder son of Giles Fletcher, the Elder, and brother of Giles, the Younger. He was educated at Eton and at King's College, Cambridge. Fletcher became chaplain to Sir Henry Willoughby, who presented him in 1621 to the rectory of Hilgay, Norfolk, where he spent the rest of his life.

His greatest work, *The Purple Island*, was published in 1633. It included the *Piscatorie Eclogs and other Poetical Miscellanies*. *The Purple Island: or the Isle of Man*, is a poem in 12 cantos describing allegorically the human physiology and soul. The manner of Edmund Spenser is employed throughout, and the chief charm of the poem is considered by critics to be its descriptions of rural scenery. The *Piscatorie Eclogs* are pastorals, the characters of which are represented as fisherboys on the banks of the Cam, and are interesting for the light they cast on the biography of the poet himself (Thyrstil) and his father (Thelgon), and on Phineas' friendship with Cambridge men. Fletcher's poetry has not the sublimity sometimes reached by his brother Giles.

Flettner, Anton (b. Nov. 1, 1885, Eddersheim, Ger.—d. Dec. 29, 1961, New York City), German inventor of the rotor ship, a vessel propelled by revolving cylinders mounted vertically on the deck. He also invented the Flettner trim-tab control for aircraft and the Flettner marine rudder.

Flettner directed an aeronautical and hydrodynamic research institute in Amsterdam following World War I. In 1926 he established in Berlin an aircraft company that produced the Flettner Fl 282 and other helicopters for the German Luftwaffe (Air Force) during World War II. After the war he went to the U.S., where he conducted helicopter research for the U.S. Army and was president of the Flettner Aircraft Corporation, Kew Gardens, Queens, N.Y.

fleur-de-lis, also spelled FLEUR-DE-LYS, or FLEUR-DE-LUCE (“lily flower”), stylized emblem or device much used in ornamentation and, particularly, in heraldry, long associated with the French crown. Strictly, it consists of three petals or leaves—the central one erect, the other two curving right and left away from it—joined by a horizontal band below which the smaller feet of the three petals are visi-

ble. Variant forms are the *fleur-de-lis au pied coupé*, or *au pied nourri*, in which the feet are absent or are replaced by a trapezoid pedestal, and the *fleur-de-lis remplie*, or *florencée*, or

Fleur-de-lis

épanouie, with stamens shown between the petals and with the petals themselves divided like flowers at their upper extremities. If a lily is represented naturalistically in heraldry, it is called a *lis-de-jardin* (“garden lily”) to distinguish it from the stylized fleur-de-lis.

An emblem similar to the fleur-de-lis is often found in art from the earliest times in many parts of the world and may not always signify a flower. The principal importance of the emblem, however, derives from its long association with the French royal arms. There is a legend that a lily, emblematic of purity, was sent from heaven to the Frankish king Clovis (c. 466–511) at his Baptism, and it has been suggested that the name fleur-de-lis is a pun on *fleur de Louis* (Louis-Clovis); but perhaps the figure was derived from that of a dove descending, symbolic of the Holy Spirit. Louis VI of France used the device both as his seal and on coins; Louis VIII wore blue vestments embroidered with gold lilies at his consecration; and soon a blue shield sprinkled with golden fleurs-de-lis was adopted as the royal arms. Charles V of France in 1376 limited the number of fleurs-de-lis to three, in honour of the Holy Trinity. The association of the device with the French crown led to its inclusion in the arms of numerous gentlemen and municipalities in France, and the English kings during the Hundred Years' War began quartering the French arms with their own to represent their claims to French sovereignty; they were to remain until George III's time. The red lily (*fleur-de-lis épanouie*) is the badge of Florence in Italy.

Fleurus, municipality, Hainaut province, south central Belgium, between the industrial region of Charleroi and the hills sloping toward Waterloo. Built on the site of a Gallo-Roman agricultural settlement and first mentioned in 868, it was chartered in 1115 and was the scene of several important battles.

Notable architectural remains include the Romanesque church (c. 1150–1200), of which only the tower and central nave stand; the Cistercian Soleilmont Abbey; the Naveau Windmill (1667); Napoleon's observatory during the Waterloo Campaign; and the memorial (1936) to the three French military victories. In 1690 the French under Marshal Luxembourg defeated the Germans and Dutch in Fleurus. A later victory was that of the revolutionary army (led by Marshal Jourdan), over the Austrians in 1794. Then, in 1815, prior to Waterloo, Napoleon defeated the Prussians commanded by Field Marshal Blücher. Fleurus is a junction of several local railways; industries include coal mining and the manufacture of machinery, domestic appliances, and furniture. Pop. (1983 est.) mun., 22,245.

Fleurus, Battle of (June 26, 1794), the most significant battle in the First Coalition phase of the French Revolutionary Wars. Jean-Baptiste Jourdan and Jean-Baptiste Kléber led 73,000 French troops against 52,000 Austri-

ans and Dutch, under Friedrich Josias, prince of Saxe-Coburg, and William V, prince of Orange, stadholder of Holland. Jourdan had taken Charleroi, in the rear of Coburg's main forces, on June 25, after besieging it since June 12. Coburg, unaware that the town had fallen, was marching to relieve it and to protect his rear forces. His five attack columns were successful at first against the French lines and inflicted very heavy casualties. The larger French force was able to endure the casualties and counterattack. Coburg retreated across the Meuse the next day with only half as many losses as the victorious French. Nevertheless, within a month, the Austrians abandoned the southern Netherlands (modern Belgium), which was annexed by France.

Fleury, original name ABRAHAM-JOSEPH BÉ-NARD (b. Oct. 26, 1750, Chartres, Fr.—d. March 3, 1822, Ménars-le-Château), French actor of the Comédie-Française, one of the greatest comedians of his time.

Fleury, detail from an engraving by Étienne-Frédéric Lignon

By courtesy of the Ashmolean Museum, Oxford

Fleury began his stage apprenticeship at Nancy, Fr., where his father was an actor at the court of Stanislaw I, duke of Lorraine and Bar. After encouragement from Voltaire, he acted at the Comédie-Française in 1774 but returned to the provinces for further study, performing chiefly at Lyon.

When Fleury returned to Paris in 1778 he was made a full member of the Comédie-Française, for which he served as doyen, or leader, until his retirement in 1818. During the French Revolution he and many of his fellow players were arrested (1793) for presenting a politically controversial play, *L'Ami des Lois* ("The Friend of Laws"). When liberated, Fleury appeared at various theatres until, in 1799, he rejoined the reconstituted Comédie-Française. A master of comedy, he was especially noted for his brilliant characterization of Alceste in Molière's *Misanthrope*.

Fleury, André-Hercule de (b. June 22, 1653, Lodève, Fr.—d. Jan. 29, 1743, Paris),

André-Hercule de Fleury, engraving by G. Massi after a painting by Hyacinthe Rigaud

By courtesy of the Bibliothèque Nationale, Paris

French cardinal and chief minister who controlled the government of King Louis XV from 1726 to 1743.

The son of a collector of ecclesiastical revenue, Fleury became a priest and eventually almoner to the King in 1683 and bishop of Fréjus in 1698. Shortly before his death in September 1715, Louis XIV appointed Fleury tutor to his five-year-old great-grandson and heir, who succeeded to the throne as Louis XV. In June 1726 Louis XV appointed Fleury minister of state and had him created a cardinal in order to give him precedence in the royal council. Fleury never assumed the title *premier ministre* ("first minister"), but he was in fact the chief minister of the realm. Ruling with an iron hand, he authorized continuation of the codification of civil law that had begun under Louis XIV and the institution of fiscal reforms that enabled French finances to recover from the costly wars of Louis XIV.

Fleury's major achievements were in foreign policy. He at first formed a close working relationship with the British prime minister, Sir Robert Walpole, and strove to reduce the tensions that were mounting between Great Britain and Spain. As a result of his efforts, the hostilities that broke out between Spain and Great Britain in 1727 were prevented from developing into a European conflict. Nevertheless, after 1731 Fleury sought to undermine British influence on the Continent and to reconcile France with Austria. His plans were temporarily upset in 1733, when Russia, Austria's ally, forcibly prevented Louis XV's father-in-law, Stanislaw Leszczyński, from claiming the Polish throne. The war party compelled Fleury to support Leszczyński in the ensuing War of the Polish Succession (1733–38) against Austria and Russia. Though French forces occupied Lorraine, Fleury limited the scope of the conflict by securing British neutrality and restricting French military operations in Germany and Italy. In 1738 Fleury concluded a peace treaty by which Leszczyński renounced his claims to the Polish throne and accepted instead the crown of Lorraine. (In accordance with this agreement, Lorraine was annexed by France upon Leszczyński's death in 1766.) Fleury's diplomatic maneuvers had secured closer relations between France and Austria and had broken British dominance in the affairs of the Continent.

Nevertheless, in 1740 the stability of Austria—and the peace of Europe—was threatened by the death of the Holy Roman emperor Charles VI. Fleury recognized the succession of Charles's daughter, Maria Theresa, to the Austrian dominions but sought to secure the election of a French client, Charles Albert, elector of Bavaria (Holy Roman emperor 1742–45), to the imperial throne. The cardinal was, however, too old and feeble to wage a vigorous struggle against the war party, which had fallen under the control of Marshal Charles-Louis de Belle-Isle. Overruling Fleury, Belle-Isle forged an alliance with Prussia in 1741 and entered the war against Austria (War of the Austrian Succession, 1740–48). By the time that Fleury died in early 1743 it was evident that France could gain little from the conflict.

Flevoland, *province* (province), central Netherlands, consisting of three polders reclaimed from the eastern side of Lake IJssel (IJsselmeer), part of the former Zuiderzee. Flevoland province, which covers an area of 548 square miles (1,420 square km), was established in 1986 and includes the municipalities of Almere and Zeewolde on South (Zuidelijk) Flevoland Polder, Dronten and Lelystad on East (Oostelijk) Flevoland Polder, and Noord-oostpolder and Urk on Northeast (Noordoost) Polder. The South and East Flevoland polders form a continuous expanse of rich marine clay separated from the Northeast Polder to the

north by the 1- to 3-mile- (1.6- to 5-kilometre-) wide Lake Ketel, from Overijssel and Gelderland provinces to the east and southeast by the narrow Lake Veluwe, and from Utrecht and Noordholland provinces to the south and southwest by the narrow Gooi and Eem lakes. The Northeast, the East Flevoland, and the South Flevoland polders were completed in 1942, 1957, and 1968, respectively.

The province produces apples, cereals, and flowers and contains dairy cattle. It also functions as a residential area for the "overspill" from the northern Randstad and is used for light industrial and recreational purposes. The major population centre and provincial capital is Lelystad on Lake IJssel in East Flevoland Polder. Pop. (1986 est.) 177,334.

Flewelling, Ralph Tyler (b. Nov. 23, 1871, De Witt, Mich., U.S.—d. March 31, 1960, Glendale, Calif.), American Idealist philosopher whose writings and teaching established the University of Southern California, Los Angeles, as one of the strongholds of Personalism.

Flewelling studied at Boston University (Ph.D., 1909) with Bordon Parker Bowne, founder of Personalism in the United States. After moving to the University of Southern California in 1917, Flewelling founded (1920) *The Personalist*, an international review of philosophy, religion, and literature. *The Person* (1952), written after his retirement in 1945, contains a comprehensive exposition of his views.

flexible shaft, in practical mechanics, a number of superimposed, tightly wound, helical coil springs wrapped around a centre wire, or mandrel. Because of its construction, the shaft can be bent, without fracture, to a much smaller radius than a solid shaft of the same outside diameter. The shaft is connected to the power source and the driven member by special fittings that are soldered or swaged on

Flexible-shaft construction

the ends of the shaft. For transmitting power around corners and for considerable distances, flexible shafts are usually cheaper and more convenient than belts, chains, or gears. Automobile speedometers are driven by flexible shafts, and such shafts are useful for portable tools such as sanders and grinders.

Flexner, Abraham (b. Nov. 13, 1866, Louisville, Ky., U.S.—d. Sept. 21, 1959, Falls Church, Va.), educator who played a major role in the introduction of modern medical and science education to American colleges and universities.

Founder and director of a progressive college-preparatory school in Louisville (1890–1904), Flexner issued an appraisal of American educational institutions (*The American College: A Criticism*; 1908) that earned him a Carnegie Foundation commission to survey the quality of the 155 medical colleges in the United States and Canada. His report (1910) had an immediate and sensational impact on American medical education. Many of the colleges that were severely criticized by Flexner closed soon after publication of the report; others initiated extensive revisions of their policies and curricula.

As secretary to the Rockefeller Foundation's

General Education Board (1913–28), he actively channeled more than half a billion dollars from private donors into the improvement of American medical education. In 1930 he realized his ambition to create a model centre for higher learning when he founded the Institute for Advanced Study, Princeton, N.J. As the institute's first director (1930–39), Flexner gathered together several of the world's most distinguished scientists, highlighted by the arrival there in 1933 of Albert Einstein.

Flexner, Simon (b. March 25, 1863, Louisville, Ky., U.S.—d. May 2, 1946, New York, N.Y.), American pathologist and bacteriologist who isolated (1899) a common strain (*Shigella dysenteriae*) of dysentery bacillus and developed a curative serum for cerebrospinal meningitis (1907).

Simon Flexner was the brother of the educator Abraham Flexner. After teaching at Johns Hopkins University, Baltimore (1895–99), and at the University of Pennsylvania (1899–1903), he helped organize the Rockefeller Institute for Medical Research (now Rockefeller University; 1903), New York City, which, under his leadership, became the world's leading centre for virus disease research.

As director of the Rockefeller laboratories (1903–35) and institute (1920–35), Flexner led the research team that was able to produce in monkeys a nonfatal form of poliomyelitis and pass it from monkey to monkey, thus trapping a polio virus for laboratory study.

flexography, form of rotary printing in which ink is applied to various surfaces by means of flexible rubber (or other elastomeric) printing plates. The inks used in flexography dry quickly by evaporation and are safe for use on wrappers that come directly in contact with foods.

In flexography, the desired imagery or lettering is engraved in the form of tiny indentations, or cells, onto a flexible rubber plate by means of plastic-molding techniques. Liquid ink is flooded onto a rotating ink-metering roller while a blade inclined at a reverse angle to the direction of rotation shaves any surplus ink from the ink-metering roller. The remaining ink is rolled onto the rubber printing plate, which is affixed to a rotary letterpress cylinder, and the plate's tiny indentations receive and hold the ink. The inked plate then transfers the image or type to paper (or some other material) that is held on an impression cylinder.

Flexography has been widely used as a quick and economical way of applying simple designs and areas of colour to a wide variety of packaging materials, such as paper and plastic containers (including waxed-paper ones), corrugated-cardboard boxes, tape, envelopes, and metal foil. The inks used can be overlaid to achieve brilliant colours and special effects. Among the fluid inks used in flexography are aniline inks (aniline dyes dissolved in alcohol or some other volatile solvent), polyamide inks, acrylic inks, and water-based inks. These are superior to oil-based printing inks because they adhere to the surface of the material, while oil-based inks must be absorbed into the material.

In the late 20th century flexography began to find new and significant applications as an alternative process used in newspaper printing presses. This was because of the simplicity and ease of the flexographic ink-distribution system, which only requires a single roller to determine the thickness of the ink applied, in contrast to the 10 or so rollers needed in conventional newspaper presses using oil-based inks. New water-based flexographic inks promised further advantages in newspaper printing, since such inks do not transfer to the hands of newspaper readers (a familiar problem with newspapers) and do not present the toxic-waste disposal problems associated with oil-based inks.

flexor muscle, any of the muscles that decrease the angle between bones on two sides of a joint, as in bending the elbow or knee. Several of the muscles of the hands and feet are named for this function. The flexor carpi radialis and flexor carpi ulnaris stretch from the humerus (upper-arm bone) along the inside of the forearm to the metacarpal bones of the hand and flex the wrist. The flexor digitorum profundus is a deep muscle that originates at the ulna (bone of the forearm) and acts to bend the fingers near their tips. The flexor digitorum superficialis is closer to the surface; it originates at two points, one at the junction of the humerus and ulna and the other along the radius (bone of the forearm), and acts upon the midsections of the fingers. Also in the hand are the flexor pollicis longus and flexor pollicis brevis, long and short flexors of the thumb, originating in the forearm and base of the hand, respectively. The flexor digiti minimi brevis manus acts upon the little finger.

In the foot are the flexor digitorum longus and flexor digitorum brevis, originating at the tibia (shinbone) and calcaneus (heel bone), respectively, and acting upon the four smaller toes. The flexor hallucis longus and flexor hallucis brevis originate in the calf and near the heel, respectively, and flex the great toe. The flexor digiti minimi brevis pedis acts upon the smallest toe. *Compare* extensor muscle.

Flick Group (German corporation): see Feldmuehle Nobel AG.

flicker, any of several New World woodpeckers of the genus *Colaptes*, family Picidae (*q.v.*), that are noted for spending much time on the ground eating ants. The flicker's sticky saliva is alkaline, perhaps to counteract the formic acid that ants secrete. Its bill is slenderer than in most woodpeckers and is slightly down-curved. The six species—most with a white rump, black breastband, and varied head markings—include the yellow-shafted flicker (*C. auratus*) of eastern North America, which has more than 100 local names. This golden-winged form, which measures about 33 cm (13 inches) in length, is replaced in the West (to Alaska) by the red-shafted flicker (*C. cafer*), considered by many authorities to represent the same species as the yellow-shafted because the two forms hybridize frequently. The campos, or pampas, flicker (*C. campestris*) and the field flicker (*C. campestrisoides*)—some-

Yellow-shafted flicker (*Colaptes auratus*)

B.M. Shaub

times considered to be a single species—are common in east-central South America; they are darker birds with yellow faces and breasts.

flight, in animals, locomotion of either of two basic types—powered, or true, flight and gliding. Winged (true) flight is found only in insects (most orders), most birds, and bats. The evolutionary modifications necessary for true flight in warm-blooded animals include those of the forelimbs into wings; lightening and fusion of bones; shortening of the torso; enlargement of the heart and thoracic muscles; and improved vision. Similar modifications in insects have occurred through different evolutionary pathways. The advantages conferred by flight are also great: in terms of numbers of species as well as numbers of individuals, insects, birds, and bats are among the most successful animal groups.

Gliding flight may be of two types: gravitational gliding and soaring. Gravitational gliding may be directed, in which case the animal launches itself toward a definite target, or passive (parachuting), in which case the organism slows its descent, relying on wind for horizontal motion. Adaptations for directed gliding serve primarily to enhance the glide ratio (the amount of horizontal distance covered per unit descent) and include wing-like modifications of fins (several fish groups), webs between digits (a frog, *Rhacophorus*; several lizards), distensible rib-supported vanes (lizards of the genus *Draco*; several snakes), and a fold of skin between the forelimbs and hind limbs (marsupial gliders; colugo; sciurid and anomalurid flying squirrels).

Soaring is sustained gliding without power input. It is attained by many birds (especially large forms, such as condors and albatrosses) and a few insects (*e.g.*, monarch butterfly). In order to remain airborne, the soarer must glide in a column of air that is rising at a rate exceeding the relative rate of descent of the gliding animal.

flight recorder, byname BLACK BOX, instrument that records the performance and condition of an aircraft in flight. Governmental regulatory agencies require these devices on commercial aircraft to make possible the analysis of crashes or other unusual occurrences. Flight recorders are housed in heavy steel within layers of insulating materials, protecting them against impacts of 100 *G*'s and fires of 2,000° F (1,093° C). The recording tape is also protected against inadvertent erasure and contact with seawater. These precautions provide that the recorders will survive extreme climatic conditions as well as even the most serious accidents.

The device records several variables, including airspeed, altitude, heading, vertical acceleration, and aircraft pitch. The recorder also includes a separate device that records voice communication within the aircraft and voice transmissions by radio. Both the flight recorder and the cockpit voice recorder are carried in the tail of the aircraft.

flight shooting, in archery, a form of competition in which shooting for maximum distance is the object, with little or no regard for accuracy. Bows used may be heavy-draw, conventional handbows or even heavier foot bows, which are strapped to the feet and drawn with both hands while the archer lies on the ground. Crossbows are also used. Contestants are grouped in classes according to the pulling weight of their bows. Modern flight bows are composite (made of more than one material—*e.g.*, wood and fibreglass). Arrows are as light as possible, usually made of wood or aluminum with a barreled shape (tapered at the ends, thicker in the middle) and fitted with small plastic vanes. Modern flight shoot-

Flight shooting using a footbow
C.R. Learn

ers, whose records advance with technological improvements of bows and arrows, have shot beyond 1 mile (1.6 km).

flight simulator, any electronic or mechanical system for training airplane and spacecraft pilots and crew members by simulating flight conditions. The purpose of simulation is not to completely substitute for actual flight training but to thoroughly familiarize students with the vehicle concerned before they undergo expensive and possibly dangerous actual flight training. Simulation also is useful for review and for familiarizing pilots with new modifications to existing craft.

Two early flight simulators appeared in England within a decade after the first flight of Orville and Wilbur Wright. They were designed to enable pilots to simulate simple aircraft maneuvers in three dimensions: nose up or down; left wing high and right low, or vice versa; and yawing to left or right. It took until 1929, however, for a truly effective simulator, the Link Trainer, to appear, devised by Edwin A. Link, a self-educated aviator and inventor from Binghamton, New York. By then, airplane instrumentation had been developed sufficiently to permit "blind" flying on instruments alone, but training pilots to do so involved considerable risk. Link built a model of an airplane cockpit equipped with instrument panel and controls that could realistically simulate all the movements of an airplane. Pilots could use the device for instrument training, manipulating the controls on the basis of instrument readings so as to maintain straight and level flight or controlled climb or descent with no visual reference to any horizon except for the artificial one on the instrument panel. The trainer was modified as aircraft technology advanced. Commercial airlines began to use the Link Trainer for pilot training, and the U.S. government began purchasing them in 1934, acquiring thousands more as World War II approached.

Technological advances during the war, particularly in electronics, helped to make the flight simulator increasingly realistic. The use of efficient analog computers in the early 1950s led to further improvements. Airplane cockpits, controls, and instrument displays had by then become so individualized that it was no longer feasible to use a generalized trainer to prepare pilots to fly anything but the simplest light planes. By the 1950s, the U.S. Air Force was using simulators that precisely replicated the cockpits of its planes. During the early 1960s electronic digital and hybrid computers were adopted, and their speed and flexibil-

ity revolutionized simulation systems. Further advances in computer and programming technology, notably the development of virtual-reality simulation, have made it possible to reproduce highly complex real-life conditions.

Flin Flon, city, western Manitoba, Canada, north of Athapuskow Lake. A portion of Flin Flon lies in Saskatchewan and is jointly administered by both provinces. The name was derived (1915) from a fictional prospector, Professor Josiah *Flintabbatey Flonatin*, in the science fiction dime novel *The Sunless City* by J.E. Preston-Muddock, a copy of which was reputedly enjoyed by the area's founders. A large statue of the professor, designed by American cartoonist Al Capp, stands on the town's outskirts. The community was established around Ross Lake and other small lakes in 1928, the year a railroad line was completed from The Pas (97 miles [156 km] south-southeast) and shortly after a Hudson Bay Mining and Smelting Company plant was built on the site. Flin Flon's economy still centres on the mining and smelting of copper and zinc, but lumbering, fishing, and tourism are also significant. The town was incorporated in 1946. Pop. (2001) 6,000.

Flinck, Govert (b. Jan. 25, 1615, Kleve, Brandenburg [now in Germany]—d. Feb. 2, 1660, Amsterdam, Dutch Republic [now in The Netherlands]). Baroque painter of portraits, genre, and narrative subjects, one of Rembrandt's most accomplished followers.

Flinck first studied in Leeuwarden and later entered Rembrandt's studio. As a painter of biblical and allegorical subjects, he at first modeled his style closely on Rembrandt's, as, for example, in his "Crucifixion" (1643?). Later he developed a more florid and oratorical manner, in which he appears to have been influenced by Rubens, as in the "Allegory in Memory of Prince Frederick Henry" (1654). Flinck's most successful works were portraits, and he was especially successful in his group portraits—e.g., "A Goldsmith and His Family," and "Celebration of the Civic Guard at the Signing of the Peace of Münster" (1648).

Flinders, Matthew (b. March 16, 1774, Donington, Lincolnshire, Eng.—d. July 19, 1814, London), English navigator who charted much of the Australian coast.

Flinders entered the Royal Navy in 1789 and became a navigator. In 1795 he sailed to Australia, where he explored and charted its southeast coast and circumnavigated the island of Tasmania. As commander of the "Investigator," he again sailed from England for Australia in 1801. On this visit he surveyed the entire southern coast, from Cape Leeuwin, in the southwest, to the Bass Strait, which separates mainland Australia from Tasmania. On July 22, 1802, he sailed from Sydney (on Port Jackson) and charted the east coast of Aus-

Flinders, miniature by H.G. de C. Jones, after an oil painting by an unknown artist; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

tralia and the Gulf of Carpentaria on the north coast. Continuing westward and southward, he circumnavigated Australia and again reached Port Jackson on June 9, 1803.

In October, on the voyage back to England, the condition of his ship required him to stop at the Île de France (now Mauritius) in the western Indian Ocean. There he was interned by the French authorities and was not allowed to leave for England until 1810. His *Voyage to Terra Australis* appeared shortly before his death.

Flinders Island, northernmost and largest island of the Furneaux Group, Tasmania, Australia, with an area of about 800 square miles (2,080 sq km). It lies in eastern Bass Strait, between Tasmania and the Australian mainland, and is named for Matthew Flinders, the English navigator who surveyed its coasts in 1798. The island is hilly, rising to Strzelecki Peaks, 2,552 feet (778 m), in the south. It is indented with numerous bays; those on the west coast are rimmed with terra rossa ("red earth") soils and support cattle and sheep. The main settlement is at Whitemark, on the west coast. A sanctuary for Cape Barren geese opened there in 1980. Pop. (2001 prelim.) 890.

Flinders Ranges, mountain region in South Australia, extending some 500 miles (800 km) northward from Cape Jervis (at the southeastern tip of Gulf St. Vincent) to a point between Marree and Lake Callabonna (dry), where it falls away to flat grazing land. Northeastward beyond Peterborough, the highland region continues as the Mount Lofty Ranges. The Flinders exceed 3,000 feet (900 m) at several points, reaching 3,825 feet (1,166 m) at St. Mary Peak, the state's second highest peak. The ranges contain the Ediacara fauna, an assemblage of fossilized Precambrian animals. They feature scenic landscapes, such as the Germein and Alligator gorges, the Wilpena Pound Depression, and the Arkaba Hills. There are two major national parks, Flinders

Brachina Gorge in Flinders Ranges National Park, Flinders Ranges, S.Aus., Australia

© Bill Bachman

Ranges National Park and Gammon Ranges National Park. Named for Matthew Flinders, the English navigator who sighted the peaks in 1802, the ranges have been mined for gold, silver, copper, lead, barite, and coal.

Flinders River, longest river in Queensland, Australia, rising on the southwestern slopes of the Gregory Range (Eastern Highlands) in the northern section of the state, 100 mi (160 km) west of Charters Towers, and flowing west past Hughenden and Richmond; it then curves northwest and north to enter the Gulf of Carpentaria through two mouths, the second known as the Bynoe River, after a course of 520 mi. Fed by the Saxby and Cloncurry rivers, the Flinders seasonally drains a 41,600-sq-mi (107,700-sq-km) basin, with only its lowest 70 mi usually perennial. It was named

for the English navigator Matthew Flinders by Captain John Stokes of HMS *Beagle*. The river's valley was first settled in 1864. The riverine lands, particularly nearer the gulf, are used in part for raising cattle and sheep.

Flint, city, seat (1836) of Genesee county, eastern Michigan, U.S. It lies along the Flint River, 60 miles (97 km) northwest of Detroit. It originated in 1819 as a trading post (opened by Jacob Smith). Laid out beginning in 1830 and named for the river (which the Indians called Pawanunging, "River of Flint"), the settlement progressed as a fur-trading, lumbering, and agricultural centre. Abundant local supplies of timber led to the development in 1886 of the Durant-Dort Carriage Company, and by 1900 Flint was producing more than 100,000 horse-drawn vehicles a year. The body, spring, and wheel companies of the carriage industry became suppliers for the Buick Motor Company, which moved from Detroit to Flint in 1903. In 1908 William C. Durant consolidated Flint's major manufacturing resources into the General Motors Company. The city's growth paralleled the success of the automotive industry, and by the 1950s it was the site of the largest single manufacturing complex of General Motors. Flint became second only to Detroit in the manufacture of automobiles, auto parts, and supplies in the United States. However, the closing or relocation elsewhere of various General Motors plants in Flint in the 1980s and early '90s left the city with a shrinking economy and population.

Kettering University (founded 1919 as the Flint Institute of Technology, later the General Motors Institute) and the University of Michigan-Flint (1956) are located in the city. The Flint Institute of Arts, the Robert T. Longway Planetarium, and the Alfred P. Sloan Museum (which displays carriages and antique autos) form part of the Flint Cultural Center, founded in 1957. Inc. city, 1855. Pop. (2000) city, 124,943; Flint PMSA, 436,141.

Flint, Austin (b. Oct. 20, 1812, Petersham, Mass., U.S.—d. March 13, 1886, New York, N.Y.), one of the most eminent of 19th-century physicians, and a pioneer of heart research in the United States. He discovered (1862) a disorder—now known as the Austin Flint murmur—characterized by regurgitation of blood from the aorta into the heart before contraction of the ventricles.

As professor of medicine at the Bellevue Hospital Medical College, New York City (1861–86), and president of the American Medical Association (1883–84), Flint had a great influence on the early course of medicine in the United States. A proponent of improved European diagnostic methods, he popularized the binaural stethoscope in the United States. His *Treatise on the Principles and Practice of Medicine* (1866) is a medical classic.

Flint, F.S., in full FRANK STUART FLINT (b. Dec. 19, 1885, London, Eng.—d. Feb. 28, 1960, Berkshire), English poet and translator, prominent in the Imagist movement (expression of precise images in free verse), whose best poems reflect the disciplined economy of that school.

The son of a commercial traveler, Flint left school at the age of 13 and worked at a variety of jobs. At the age of 17 his reading of a volume by the 19th-century Romantic poet John Keats fired his enthusiasm for poetry. Two years later he became a civil-service typist and enrolled in a workingman's night school. He learned French and Latin (eventually he mastered 10 languages) and after World War I rose to become a high official in the Ministry of Labour.

Flint's first volume of poetry, *In the Net of the Stars* (1909), was a collection of love lyrics, clearly showing the influence of Keats and his

contemporary Percy Bysshe Shelley. The same year, he and a group of young poets, all dissatisfied with the state of English poetry, began working to overthrow conventional versification and to replace strict metre with unrhymed cadence (a term he appropriated). His friendship with the English poet T.E. Hulme and the American poet Ezra Pound helped him to develop further his own distinctive poetic style. *Cadences* (1915) and *Otherworld* (1925) established him as a leading member of the Imagists. After the death of his wife in 1920, Flint suddenly stopped writing. He did, however, continue to produce translations, mostly of French works.

flint glass, also called CRYSTAL, or LEAD CRYSTAL, heavy and durable glass characterized by its brilliance, clarity, and highly refractive quality. Developed by George Ravenscroft (*q.v.*) in 1675, it ushered in a new style in glassmaking and eventually made England the leading glass producer of the world. Ravenscroft's experimentation was supported by the Worshipful Company of Glass Sellers, a body of English retailers long dissatisfied with the quality of glass from Isola (island) di Murano, Venice.

The first clear crystal Ravenscroft produced, called flint glass because calcined flint was used as a base, decayed after a period of time. This fault was overcome by adding lead oxide to produce lead crystal. ("Flint glass" thus became a synonymous term for lead crystal, though flint is no longer part of its composition.) The Glass Sellers furnished the designs and set exacting standards for the product. Their earliest examples bear the seal of a raven's head. In time, the adaptation of European traditional styling to the new glass produced a genuine native English style of glassware.

In the optical glass industry, flint glass is any highly refractive lead-containing glass used to make lenses and prisms. Because it absorbs most ultraviolet light but comparatively little visible light, it is also used for telescope lenses. The light-dispersive power of flint glass can be made twice as high as that of crown glass (of conventional soda-lime composition), and the two complementary types of glass are cemented together to make lenses corrected for chromatic aberration. In the container glass industry, flint glass is any clear glass free of colouring.

Flint Ridge Cave System, a complex of caves and underground rivers in west-central Kentucky, U.S. The surveyed areas of the system are entirely within Mammoth Cave National Park (*q.v.*). The caverns are interconnected to a great extent, and some 350 miles (560 km) of them have been mapped. Flint Ridge is a plateau capped by resistant sandstone and shale layers, underlain by hundreds of feet of limestone. Acidic groundwater has dissolved portions of the limestone without affecting the overlying sandstone and shale, producing the caves.

Prominent features within the caverns include extensive sulfate mineral formations, stalactites, stalagmites, and archaeological artifacts. The system's hub and gateway is Floyd Collins' Crystal Cave, named for its discoverer (1917). In 1972 a connection was discovered between the Mammoth and Flint Ridge cave systems, making them by far the longest continuous cave system in the world.

flintlock, ignition system for firearms, developed in the early 16th century. It superseded the matchlock and wheel lock and was itself outmoded by the percussion lock in the first half of the 19th century. The best-developed form, the true flintlock, was invented in France in the early 17th century, probably by Marin le Bourgeois. It had a frizzen (striker) and pan cover made in one piece. When the trigger was pulled, a spring action caused the frizzen to strike the flint, showering sparks

onto the gunpowder in the priming pan; the ignited powder, in turn, fired the main charge in the bore, propelling the ball.

Flintshire, also called FLINT, Welsh Sir Fflint, county in the northeastern corner of Wales, bounded to the east by the River Dee and England and to the west by Denbighshire. Flintshire encompasses an area along the lower Dee and the Dee estuary and extends inland to the Clwydian Range. The historic county of Flintshire includes all of the present county as well as the northern portion of the present county of Denbighshire and the eastern portion of the county borough of Wrexham.

A Celtic tribe known as the Deceangli held the region before they were overrun by the Romans in the 1st century AD. Roman remains in the area are quite sparse, however. Both Offa's and Watt's dykes traversed Flintshire and demarcated England on the east from Wales on the west. Flintshire was the scene of protracted fighting in the 12th and 13th centuries as its Welsh inhabitants resisted Anglo-Norman domination. Tightening their hold on the region, the English built great castles at Dyserth, Rhuddlan, and Flint, and King Edward I of England achieved a final conquest of the area in 1284. That same year he formed the county of Flintshire and gave the castle at Caergwrle to his queen, Eleanor of Castile. Henry VIII increased the county's territory in the mid-16th century. In the English Civil Wars of the mid-17th century, Flintshire was solidly royalist.

The Greenfield valley at Holywell was one of the birthplaces of the Industrial Revolution, and rich coal deposits along the River Dee gave rise to an iron and steel industry and to shipbuilding during the 19th century. Eastern Flintshire remains a heavily industrialized region. Engineering, chemicals, and synthetic textiles—particularly rayon—have developed in Flint, Connaught's Quay, and other towns. Mold, the historic county town (seat) and administrative centre of Flintshire, is also a market centre for the agricultural region to the west. Tourist attractions in Flintshire include St. Winifred's Well at the parish church in Holywell and the extensive bird sanctuaries along the shore of the Dee estuary. Daniel Owen, widely considered the father of the Welsh novel, was born in Mold in 1836. Area 169 square miles (437 square km). Pop. (1998 est.) 147,000.

FLN (Algerian political party): *see* National Liberation Front.

Flodden, Battle of (Sept. 9, 1513), English victory over the Scots, fought near Branxton, Northumberland. To honour his alliance with France (1512) and divert troops from the main English army, which was then in France under Henry VIII, James IV of Scotland crossed the border (Aug. 22, 1513) with an army of about 30,000 men supported by artillery. Thomas Howard, earl of Surrey, Henry's lieutenant in the north, gathered an army of about 20,000 to oppose him. Fearing that the Scots would retreat to the border, Surrey issued a challenge to James, who agreed to wait until September 9 to fight. The battle began in the late afternoon. The Scots fought stubbornly, but the English 8-foot- (2.5-metre-) long bill (a staff ending in a hooked-shaped blade) proved superior to the Scottish 15-foot (4.5-metre) spear; and English archers proved decisive on the Scottish right. By nightfall the Scottish army was annihilated. James was killed, together with at least 10,000 of his subjects, including high officers of church and state and many nobles.

Flodoard (b. 893 or 894, probably at Épernay, Champagne [France]—d. March 28 or

May 17, 966, probably at Reims), chronicler whose two major works, the *Annales*, a chronicle covering the period 919 to 966, and the *Historia Remensis ecclesiae* ("History of the Church in Reims"), provide the essential documentation for this period.

After returning from a visit to Pope Leo VII in Rome, Flodoard became involved in a dispute between Herbert, Count of Vermandois, who wanted his son Hugh as archbishop of Reims, and Artauld, Flodoard's patron. Herbert had Flodoard imprisoned for a time in 940–941. After the meeting in 948 of a synod at Ingelheim, at which Pope Agapetus II reinstated Artauld, Flodoard was made keeper of the records at Reims. In 951 Flodoard failed in an attempt to become bishop of Noyon.

Floard at various times had custody of the archiepiscopal archives at Reims, and his *Historia Remensis ecclesiae* is an abstract of their most important contents. Among its vital documents is a long catalog of the letters of the archbishop Hincmar of Reims.

flogging, a beating administered with a whip or rod, usually on the person's back. Flogging was once a common method of punishing criminals and of preserving discipline in the home, school, armed forces, and prisons. In the Mosaic code flogging was a punishment for crime. Slaves in the ancient world were frequently flogged to death when they were sufficiently numerous to be of little value. Black slaves in the American South before the Civil War were frequently flogged, but rarely to the point of death because they were too valuable.

During the 19th century, imprisonment gradually replaced corporal penalties as a punishment for crime. But the courts retained the power to sentence a prisoner to be whipped when convicted of violent crimes. In England, Scotland, and Wales the Criminal Justice Act of 1948 deprived the courts of the power to sentence a person to a whipping in most cases. Except in Scotland, however, the power to inflict corporal punishment was retained until 1967 for mutiny, incitement to mutiny, and gross personal violence to an officer of a prison when committed by a male person. In the second half of the 20th century, the flogging of certain criminals was still prescribed by law in Canada, some European and Asiatic countries, and until 1972 in the state of Delaware in the United States, where public whippings were administered at the discretion of the court for 25 different crimes.

The instruments and methods of flogging have varied. In maintaining discipline in the home and school, sticks, rods, straps, whips, and other objects are used. Elsewhere the lash has been widely used, usually elaborated, as in the cat-o'-nine-tails. This is constructed of nine knotted cords or thongs of rawhide attached to a handle. The Russian knout, consisting of a number of dried and hardened thongs of rawhide interwoven with wire, the wires often being hooked and sharpened so that they tear the flesh, is even more painful and deadly. A particularly painful, though not so deadly, type of flogging is the Oriental bastinado, or blows delivered on the soles of the feet with a light rod or knotted cord or lash. Flogging was formerly executed with great brutality. The backs of the condemned were frequently lacerated, and salt was poured into the wounds to increase the pain.

Flogstad, Kjartan, pseudonym K. VILLUM (b. June 7, 1944, Sauda, Nor.), Norwegian poet, novelist, and essayist best known for his novel *Dalen Portland* (1977; "Portland Valley"; Eng. trans. *Dollar Road*).

Some of Flogstad's deepest affinities were with Latin-American writers. He translated the Chilean poet Pablo Neruda in *Dikt i utval*

(1972; "Selected Poems"), as well as various Cuban poets in *Dikt frå Cuba* (1973; "Poems from Cuba").

Flogstad's own poetry, published in *Valfart* (1968; "Pilgrimage") and *Seremoniar* (1969; "Ceremonies"), is a skillful mixture of symbolism, wide and eclectic reading, humour, and a responsiveness both to city and village life. In his collection of essays and short fictions, *Den hemmelege jubel* (1970; "The Secret Enthusiasm"), Flogstad defended literature, art, and the imagination against their opponents on both the political right and left. *Fangliner* (1972; "Prison Lines") is a collection of short stories that take a hard and unsentimental look at the lives of fishermen and factory workers. His first novel was the semiautobiographical *Rasmus* (1974). *Dalen Portland* recounts with lyrical realism the lives of small-town factory workers and sailors. In this book, political commitment, documentary material, and fantasy are brought together with a humour and verve reminiscent of the contemporary Latin-American novel. His later novels, including *Fyr og flamme* (1980; "All Fired Up"), *U3* (1983), and *Kniven på strupen* (1991; "At Knife-point"), strengthened his reputation.

Floire et Blancheflor, French metrical romance known in two versions from the 12th and 13th centuries and thought to be of Greco-Byzantine or Moorish origin. Its theme of separation and reunion of young lovers is the same as that treated in *Aucassin et Nicolette*, though the roles and religion of the two main characters are reversed. Floire is the son of a Saracen king; Blancheflor, his beloved, is a Christian. The tale was popular throughout western Europe. The English account, *Floris and Blancheflur* (or *Flores and Blancheflour*) was composed in the East Midlands dialect about 1250 and is commonly held to be one of the most charming romances in Middle English.

flood, high-water stage in which water overflows its natural or artificial banks onto normally dry land, such as a river inundating its floodplain. The effects of floods on human well-being range from unqualified blessings to catastrophes. The regular seasonal spring floods of the Nile River prior to construction of the Aswān High Dam, for example, were depended upon to provide moisture and soil enrichment for the fertile floodplains of its delta. The uncontrolled floods of the Yangtze River and the Huang Ho in China, however, have repeatedly wrought disaster when these rivers habitually rechart their courses. Uncontrollable floods likely to cause considerable damage commonly result from excessive rainfall over brief periods of time, as, for example, the floods of Paris (1658 and 1910), of Warsaw (1861 and 1964), of Frankfurt am Main (1854 and 1930), and of Rome (1530 and 1557). Potentially disastrous floods may, however, also result from ice jams during the spring rise, as with the Danube River (1342, 1402, 1501, and 1830) and the Neva River (in Russia, 1824); from storm tides such as those of 1099 and 1953 that flooded the coasts of England, Belgium, and The Netherlands; and from tsunamis, the mountainous sea waves caused by earthquakes, as in Lisbon (1755) and Hawaii (Hilo, 1946).

Floods can be measured for height, peak discharge, area inundated, and volume of flow. These factors are important to judicious land use, construction of bridges and dams, and prediction and control of floods. Common measures of flood control include the improvement of channels, the construction of protective levees and storage reservoirs, and, indirectly, the implementation of programs of soil and forest conservation to retard and absorb runoff from storms.

The discharge volume of an individual stream is often highly variable from month to month and year to year. A particularly striking ex-

ample of this variability is the flash flood, a sudden, unexpected torrent of muddy and turbulent water rushing down a canyon or gulch. It is uncommon, of relatively brief duration, and generally the result of summer thunderstorms in mountains. A flash flood can take place in a single tributary while the rest of the drainage basin remains dry. The suddenness of its occurrence causes a flash flood to be extremely dangerous.

A flood of such magnitude that it might be expected to occur only once in 100 years is called a 100-year flood. The magnitudes of 100-, 500-, and 1,000-year floods are calculated by extrapolating existing records of stream flow, and the results are used in the design engineering of many water resources projects, including dams and reservoirs, and other structures that may be affected by catastrophic floods.

Flood, Curt, byname of CURTIS CHARLES FLOOD (b. Jan. 18, 1938, Houston, Texas, U.S.—d. Jan. 20, 1997, Los Angeles, Calif.), American professional baseball player whose antitrust litigation challenging the major leagues' reserve clause was unsuccessful but led ultimately to the clause's demise.

Flood began playing baseball as a youth and was signed in 1956 by the National League Cincinnati Reds. He was traded to the St. Louis Cardinals in 1958 and played for them through the 1969 season as an outfielder. He batted over .300 in six seasons and had a career average (1956–71) of .293. When he was traded to the Philadelphia Phillies, Flood, with the backing of the Major League Baseball Players Association (MLBPA), challenged the reserve clause, which gave St. Louis the right to trade him without his permission, as violating federal antitrust laws. (Earlier attempts to overthrow the reserve clause had resulted in U.S. Supreme Court decisions in 1922 and 1953 that held the Sherman Antitrust Act law did not apply to baseball.)

Flood lost his case in 1970 but refiled it in 1971; the decision went against him. Later strike actions by the MLBPA and the consequent establishment of free agency for players with 10 years of service with the same club made the reserve clause inoperative.

After his retirement Flood became a broadcaster for the Oakland Athletics and later worked for the Oakland Department of Sports and Aquatics as commissioner of a sandlot baseball league.

Flood's autobiographical *The Way It Is*, recounting his struggle against the reserve clause, appeared in 1971.

Flood, Henry (b. 1732—d. Dec. 2, 1791, Farmley, County Kilkenny, Ire.), Anglo-Irish statesman, founder of the movement that in 1782 forced Great Britain to grant legislative independence to Ireland.

The illegitimate son of Warden Flood, chief justice of the King's Bench in Ireland, Henry entered the Irish Parliament in 1759. Irish Protestants were becoming impatient with the British Parliament's right to legislate for Ireland over the wishes of the Irish Parliament. Moreover, the British government controlled a majority in Ireland's House of Commons through the distribution of crown patronage by the owners of parliamentary boroughs. Flood's outstanding oratorical powers soon enabled him to create a small but effective opposition inside the Irish Parliament that agitated for political reforms. They demanded provisions for new Irish parliamentary elections every eight years (instead of merely at the start of a new British king's reign). Their long-range goal was legislative independence. In 1768 Flood's patriots engineered passage of a bill limiting the duration of Parliament to eight years, and in 1769 and 1771 they defeated measures to grant funds for the British administration in Ireland.

Although Flood had become the first in-

Henry Flood, engraving by James Heath from a drawing by J. Comerford, published in 1811

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co Ltd

dependent Irish statesman, he sacrificed this position in 1775 by accepting the office of vice treasurer under the British viceroy, Lord Harcourt. Henry Grattan, an even greater orator than Flood, replaced him as leader of the patriots. (Grattan described Flood as a man "with a metaphor in his mouth and a bribe in his pocket.") Flood had, however, left the patriot cause at the wrong time; the movement grew rapidly as more and more Irishmen were influenced by the North American colonists who were rebelling (1775–83) against the British. In 1779 Flood rejoined his old party, and two years later he was officially dismissed from his government post. Although Flood had lost his following, he helped Grattan force the British government to renounce its restrictions on Irish trade (1779) and grant legislative independence to Ireland (1782). Flood then decided to challenge Grattan's leadership. Charging that Grattan had not gone far enough in his reforms, Flood obtained passage of a measure requiring the English Parliament to renounce all claims to control of Irish legislation. Nevertheless, Flood's newly acquired popularity was destroyed upon the defeat of his attempt to reform the Irish Parliament in 1784. From 1783 until his retirement in 1790 he was a member of both the British and the Irish parliaments, though in England he failed to achieve the kind of political successes that characterized his Irish parliamentary career.

floodgate, gate for shutting out or releasing the flow of water over spillways, in connection with the operation of a dam. Vertical-lift, or radial, gates rise to permit flow under the gate but over the spillway crest. Drum gates rotate

Floodgates of the Wanapum Dam on the Columbia River, Washington

Bob and Ira Spring

backward, lowering their tops and permitting a measured flow over the top of the gate. Drum gates present the fewest problems in the passage of ice or drift over the spillway.

floodplain, also called ALLUVIAL PLAIN, flat land area adjacent to a stream, composed of unconsolidated sedimentary deposits (alluvium) and subject to periodic inundation by the stream. Floodplains are produced by lateral movement of a stream and by overbank deposition; therefore they are absent where down-

cutting is dominant. Any erosional widening of one bank is approximately equalled by deposition on the opposite side of the channel in the form of bar development along the inside of meander bends. Thus, the simplest floodplain is made up of a strip of sinuous scrolls immediately adjacent to the stream.

As meander curves enlarge, the alluvium is constantly reworked and the floodplain widened. The minimum width for a completely developed floodplain is equal to meander amplitude, but some floodplains are developed on deep and wide valley fills and are many times wider than the meander belt. The floodplain of the Mississippi River below its confluence with the Ohio has an occasional width of 80 miles (130 kilometres), with a total area estimated as 50,000 square miles (130,000 square kilometres).

During inundation, silt drops from the retreating floodwater and, trapped by vegetation, tends to build up and level the floodplain surface. Buildup is greatest near the stream, forming natural levees in areas of stable banks. Floodplain deposits may show vertical size-graded stratification (sorting), tending to be coarser near the stream. The floodplain is an integral part of the stream system and is affected by the adjustments that the system makes to its sediment load and variable flow.

floor exercise, gymnastics event in which movements are performed on the floor in an area 12 metres (39 feet 4.5 inches) square. This area is covered by some type of cloth or mat, usually with cushioning. No other apparatus is used. Men's routines are 50 to 70 seconds in

Andrea Raducan of Romania during the gymnastics floor exercises final at the 2000 Olympic Games in Sydney, Australia

Shaun Bottenell—Getty Images

duration. The women's event is similar to the men's, except that it is performed to music and lasts 70 to 90 seconds. The type of exercise required is a series of movements combining elements of flexibility, strength, and balance and featuring jumps, the holding of poses, and other maneuvers. The routine must be performed with rhythm and harmony, and the gymnast must move in different directions, using a major portion of the square.

The routine usually starts and finishes with a series of tumbling movements, such as a hand-spring or a cartwheel with a half-turn (round-off), continuing with handsprings and somersaults (in the air), either backward or forward. Between start and finish, the gymnast may balance on one leg, or perform a handstand; movements resembling ballet, tumbling movements, and jumps are interposed.

The floor exercise was introduced as an individual Olympic medal sport for men in 1936 and for women in 1952.

Floquet, Charles (-Thomas) (b. Oct. 2, 1828, Saint-Jean-Pied-de-Port, France—d. Jan. 18, 1896, Paris), French politician whose deep attachment to the republic led him to become an antagonist of the political aspirations of Gen. Georges Boulanger.

Floquet, c. 1880

H. Roger-Viollet—Haringue

Floquet strongly opposed the Second Empire and rapidly made a name for himself as a republican lawyer and journalist. In 1870–71 he participated in the formation of the new republic and helped form the Ligue d'Union Républicaine de Droits de Paris in hopes of bridging the gap between the new government and the members of the Paris Commune, who had rebelled against it.

Floquet served as president of the Paris municipal council and in 1876 moved to the Chamber of Deputies as a Radical Party member. After a term as president of the chamber, he formed his own cabinet in April 1888. Faced with the rising tide of Boulangism, a movement centred on General Boulanger which threatened an anti-republican coup d'état, he openly attacked the general. On July 13 Floquet and Boulanger met in a duel in which the prime minister severely wounded Boulanger. Still, the Floquet government was overturned in February 1889.

Floquet returned to the presidency of the Chamber of Deputies (November 1889) but was forced to resign in 1892 when he was implicated in the Panama Scandal, which involved fraudulent fiscal manipulations over a proposed canal project. In 1894 he was elected to the Senate, where he served until his death. He was noted for his fiery oratory, a prime example of which is his famous retort to Boulanger in the Chamber of Deputies, "At your age, General Boulanger, Napoleon was dead." *Discours et opinions* (1885) was published in two volumes.

Flor, Roger de (b. 1280, Brindisi, Kingdom of the Two Sicilies—d. April 4, 1305, Adrianople, Byzantine Empire), Sicilian-born military adventurer and mercenary captain whose service to the Byzantine emperor Andronicus II had disastrous consequences.

As a boy he went to sea and became a Knight Templar. When Acre in Palestine fell to the Mamluks (1291), he made his fortune by blackmailing the noblewomen of Acre. Denounced by his grand master, he fled to Genoa and became commander of a force of *almogávares* (Spanish mercenaries) in service to the Aragonese king of Sicily, Frederick III, who was warring with the House of Anjou.

In 1303, with 6,500 *almogávares* known as the Grand Catalan Company, he entered the service of Andronicus II and fought with some success against the Turks. His evident intention, however, to found a principality of his own, combined with the predatory activities of his army, led to his recall at the end of 1304 and to his subsequent assassination. In revenge, the mercenaries ravaged Thrace, the hinterland of the Byzantine capital.

Flora, in Roman religion, the goddess of the flowering of plants. Titus Tatius (according to tradition, the Sabine king who ruled with Romulus) is said to have introduced her cult to Rome; her temple stood near the Circus

Flora, classical sculpture; in the Capitoline Museum, Rome

Alinari—Art Resource/EB Inc

Maximus. Her festival, called the Floralia, was instituted in 238 BC. A representation of Flora's head, distinguished only by a floral crown, appeared on coins of the republic. Her name survives in the botanical term for vegetation of a particular environment.

floral decoration, the art of arranging living or dried plant material for adornment of the body or home, or as a part of public ceremonies, festivals, and religious rituals.

A brief treatment of floral decoration follows. For full treatment, see *MACROPAEDIA: Decorative Arts and Furnishings*.

Floral arrangement is more complex than simply putting fresh flowers into a tall vase, although such arrangements are naturally one of the more familiar aspects of the art. Line, form, colour, texture, balance, proportion, and scale are all important aspects of floral arrangement, and many design principles appropriate for this art form have evolved over the centuries. The container in which the arrangement is made and the base on which it will stand are also major considerations.

Floral decoration is a three-dimensional art. Sculptural quality is produced by allowing some of the materials to project forward while others recede. Formal arrangements generally emphasize an outline, often a triangle, pyramid, or linear form, which is then filled by using contrasting colours, textures, and weights of floral materials. A visual centre is also important. Frequently, the floral artist adheres to the traditional Japanese rule, which dictates that the arrangement should be at least one and a half times higher than the height of its container.

Different techniques create different styles of arrangement. A bouquet of flowers may be arranged in a tall vase with no need for artificial aids, but frequently a pinholder, wire netting, or plastic foam is required to hold the flowers in place. Florist's wire is used to extend the stems of certain flowers or to support

the heads of others. Special tape can bind the stems for corsages and wreaths. Flowers can also be treated to last longer by soaking the stems in water and by cutting or crushing the stems before arranging.

Artificial floral arrangements include the delicate porcelain flowers made in France and England in the 18th and 19th centuries and the festive paper flowers of Mexico and Japan. Swags and wreaths were popular in antiquity. A Roman mosaic of the 2nd century AD from Hadrian's villa at Tivoli shows a basket of cut flowers, thought to be the first such depiction in art. In the 17th and 18th centuries in western Europe, particularly in Holland and France, still-life paintings of flowers show the popularity and fashion of floral arrangements.

China and Japan have a long history of floral arrangement, often linked to religious beliefs and philosophies. Ono Imoko in the early 7th century founded the oldest school of floral arranging in Japan, known as the Ikenobō, which spawned numerous descendants. Other important Japanese styles were the *tatebana* ("standing flowers") and the *rikka*, introduced by Senkei in the mid-15th century; the latter introduced the unequal triangular outline, which was to set the pattern for later Japanese floral styles. The simple uncluttered forms of Japanese floral arrangement have become influential in Western nations, particularly in the United States.

floral kingdom: see floristic region.

Florence, Italian FIRENZE, Latin FLORENTIA, city, capital of Firenze province and Toscana (Tuscany) region, central Italy. The city, located about 145 mi (230 km) northwest of Rome has been during its long history a republic, a seat of the duchy of Tuscany, and a capital (1865–71) of Italy. Florence was founded as a Roman military colony about the 1st century BC and during the 14th to 16th centuries achieved preeminence in commerce and finance, learning, and, especially, the arts. Florence's splendours reflect the genius of those who flourished there; among the most famous were Leonardo da Vinci, Michelangelo, Brunelleschi, Dante, Machiavelli, Galileo, and the Medici family.

The following article treats briefly the modern city of Florence. Fuller treatment is provided in the following *MACROPAEDIA* articles. For history and contemporary life, see Florence; for additional perspective on the city in its national context, see Italy.

Florence is built on both sides of the Fiume Arno (Arno River), which is subject to occasional flooding. The climate is temperate, its pleasant weather marred only briefly by extreme seasonal temperatures.

The city's economy is based primarily on tourism and is supported by the manufacture of traditional handicrafts—glassware and ceramics, wares of precious metals, leatherwork, art reproductions, wrought iron and straw work, and high-fashion clothing and shoes. The city is not a major manufacturing centre, however, and most industrial activity occurs in the suburbs.

The inner city of Florence is still structured on the lines of the Roman *municipium*. The old mercantile centre is now the Piazza della Repubblica, the core of modern public life. Craftwork is sold throughout the city, but traditional marketplaces still exist; among these is the Ponte Vecchio (Old Bridge), which is a commercial centre for goldsmiths, silver-smiths, and jewelers.

The historic religious centre of Florence is the site of the Battistero S. Giovanni (Baptistry of St. John) and the Gothic Duomo. The baptistry, believed to be the oldest surviving building (c. 1000) in Florence, has huge sculptured bronze doors depicting biblical scenes. The city's fresco-lined churches include many fine examples of Renaissance architecture.

The Uffizi gallery, designed by Giorgio

Vasari, is the best known of Florence's art museums. Its elegant Mannerist wings house the world's finest collection of Italian Renaissance painting, in addition to notable masterpieces of French, Dutch, Flemish, and German origin. The palaces and parks throughout the city are epitomized by the Palazzo Pitti and its richly landscaped Boboli gardens. The University of Florence and many other institutions of higher learning, including an increasing number of foreign-based universities, are located in and around the city.

Florence and the surrounding province are served by buses and trolley cars. The main highway, Autostrada del Sole, passes west and south of the city. Florence lies on the most direct railway route between northern and southern Italy, and is also connected with towns to the east and west. Area city, 40 sq mi (102 sq km). Pop. (2000 est.) 376,662.

Florence, city, seat of Lauderdale county, northwestern Alabama, U.S., on the Tennessee River, forming with Sheffield, Tusculumbia, and Muscle Shoals a four-city metropolitan area in the Muscle Shoals region. Founded in 1818, it was named for Florence, Italy, by its Italian surveyor, Ferdinand Sanona. An early property holder was Andrew Jackson, later U.S. president. Industrial development was stimulated by construction of Wilson Dam and state dock installations. Florence State University (1872) became the University of North Alabama in 1974. Indian Mound within the city is the largest in the Tennessee Valley (42 ft [13 m] high; base diameter, 310 ft); artifacts are in the adjacent museum. Inc. town, 1826; city, 1889. Pop. (2000) city, 36,264; Florence MSA, 142,950.

Florence, city, seat (1875) of Pinal county, central Arizona, U.S., 50 mi (80 km) southeast of Phoenix. It lies on the Gila River in a farming area (mainly cotton) irrigated through the Ashurst-Hayden Diversion Dam. One of the oldest white settlements in the state, it was founded in 1866 and named for the sister of Gov. Richard McCormick. The community developed as a copper-mining trade centre and stage stop, and was incorporated in 1908. Many early adobe buildings still stand including the home (1866) of Levi Ruggles, the first settler, which housed the first land office (1873) in the Gadsden Purchase territory. Nearby are Indian ruins and natural desert gardens. Pop. (2000) 17,054.

Florence, city, seat (1889) of Florence county, northeastern South Carolina, U.S. Established in the 1850s as a rail junction and transfer point for the Wilmington and Manchester, the Northwestern, and the Cheraw and Darlington railroads, it was called Wilds for a judge in the town but later renamed (c. 1859) for the daughter of William Harlee, head of the Wilmington and Manchester line.

The city developed as a retail and wholesale distribution centre, balanced between railroads, industry, and agriculture. Manufactures include film, electronic components, fabricated steel, welding equipment, furniture, textiles, and paper. The main crops are tobacco and cotton. Florence is the site of Florence-Darlington Technical College (1962), Francis Marion College (1970), Clemson University—Pee Dee Experiment Station, and a U.S. Department of Agriculture Boll-Weevil Laboratory. A National Civil War Cemetery is nearby. At the airport is the Air and Missile Museum. The one-room school in which Henry Timrod, poet laureate of the Confederacy, taught is in the city's Timrod Park. The Florence Museum exhibits classical, Oriental, primitive, and American Indian art, as well as historical items. Inc. 1890. Pop. (2000) city, 30,248; Florence MSA, 125,761.

Florence of Worcester (d. 1118), English monk, usually accepted as the author of *Chronicon ex chronicis*, which is valuable

for late Anglo-Saxon and early post-Conquest history. Its basis is the universal history (from the creation to 1082) compiled by Marianus Scotus, an Irish recluse at Mainz. The author of the *Chronicon*, like Marianus, was a careful annalist with a marked interest in chronology. He supplements Marianus' scanty treatment of English affairs by drawing on Bede, Asser, lives of English saints, laws, the Anglo-Saxon Chronicles, and also on local records and traditions.

Under the year 1118 the *Chronicon* records the death of Florence (July 7), but it is continued without break to 1131 by a John of Worcester, who, later, added material up to 1140. On the interpretation of the notice under 1118 depends Florence's claim to authorship, but what Orderic Vitalis has to say of John's historical work at Worcester suggests that John's part in the whole *Chronicon* is more substantial than has been traditionally allowed. After 1131, the *Chronicon* was copied at other monasteries, in several cases continued and frequently used by chroniclers.

The standard edition is *Florentii Wigorniensis monachi Chronicon ex chronicis*, edited by Benjamin Thorpe, English Historical Society, 2 vol. (1848–49), which excludes Marianus' text where possible, follows the *editio princeps* of 1592 by William Howard in printing the continuation to 1141, and adds a second continuation to 1295. There is a translation of English material to 1295 by R. Forster in Bohn's *Antiquarian Library* (1854).

Florence, Council of: see Ferrara-Florence, Council of.

Florence, University of, Italian UNIVERSITÀ DEGLI STUDI DI FIRENZE, university that originated in Florence in 1321 and became later in the century, through the activities of the writer Giovanni Boccaccio, an early centre of Renaissance Humanism. Boccaccio secured a post there for Leonzio Pilato, whose rough Latin translations of the *Iliad* and the *Odyssey* introduced Homer to Italian scholars. In 1396 the first university chair in Greek was established there for the scholar Manuel Chrysoloras. The university later declined and in 1473 was transferred to Pisa. The large, modern University of Florence dates from 1859.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Florence, William Jermy, original name BERNARD COLIN (b. July 26, 1831, Albany, N.Y., U.S.—d. Nov. 19, 1891, Philadelphia), U.S. actor, songwriter, and popular playwright, one of the most popular actors of his day. He was one of a select number of Americans to win the ribbon of the French Société Histoire Dramatique.

Born of Irish parents and reared on the Lower East Side of New York City, Florence worked at various jobs before becoming a call boy at the Old Bowery Theatre. While working to support his widowed mother and her seven younger children, he rehearsed plays at night, and in 1850 he began to do dialect impersonations. In 1853 he married Malvina Pray, and thereafter the two generally appeared together on the stage—he usually as an Irishman and she as a Yankee.

Florence's first success was in *A Row at the Lyceum* (1851); following this, he established his reputation as Captain Cuttle in *Dombey and Son*, Bob Brierly in *The Ticket-of-Leave Man*, and Sir Lucius O'Trigger in *The Rivals*. His last appearance was with Joseph Jefferson, with whom he had maintained a successful partnership.

Florencia, capital of Caquetá department, southeastern Colombia, in the eastern slopes

of the Andean Cordillera (mountains) Oriental, on the Rio Ortegua, a tributary of the Caquetá. It was founded in 1908 by Capuchin missionaries. Cattle raising and rice cultivation are widespread around Florencia. The city also serves as a trading centre for the densely forested lowlands to the south and east. Florencia is linked by road to Neiva, capital of Huila department, 95 mi (153 km) to the north-northeast in the Andes. Pop. (1993) 97,700.

Florencio Varela, *cabecera* (principal built-up area) and *partido* (political subdivision), at the southeastern limits of Gran (Greater) Buenos Aires, Argentina, in Buenos Aires province. Founded as the town of San Juan in 1873, Florencio Varela was declared a city in 1953. The *partido* was established in 1893, out of the existing *partidos* of Quilmes, San Vicente, and Almirante Brown.

The *partido* of Florencio Varela covers 80 sq mi (206 sq km) and is bordered by the *partidos* of Berazategui (northeast), La Plata (southeast), San Vicente and Almirante Brown (southwest), and Quilmes (northwest). Other major localities within the *partido* are Gobernador Monteverde and Bosques.

With the growth of the national capital, Florencio Varela has been absorbed into the southeastern suburban area of Gran Buenos Aires. Less than half of it lies within the Gran Buenos Aires urban area, and its population density is lower than most of the other *partidos*. Railway service and the national highway system connect the *cabecera* to Buenos Aires. Pop. (1999 est.) *partido*, 331,358.

Florensky, Pavel Alexandrovich (b. Jan. 21 [Jan. 9, old style], 1882, Yevlakh, Yelizavetpolskaya Province, Russian Empire—d. Dec. 15, 1943, Siberia), Russian Orthodox theologian, philosopher, and mathematician.

Florensky concentrated on philosophy and mathematics at Moscow University, moving on to graduate study at the Moscow Theological Academy, where he eventually taught. Ordained a priest in 1911, he went into exile during the Russian Revolution. When he returned to Moscow in 1919 to resume his work, he refused to renounce or conceal his priesthood in the face of official atheism. During the reign of Stalin in the 1930s, he was imprisoned several times and was banished to Siberia.

Florensky's chief contribution to Russian Orthodox theology is his 1940 essay on theology entitled "The Pillar and the Ground of Truth," in which he argued that only through nonrational, intuitive experience could a person become consubstantial with all of creation and thus encounter God's reality and understand God's truth. According to Florensky, rationalistic analysis separates man from creation because it objectifies the external world rather than unifying it.

Florentia (Italy): see Florence.

Florentine canvas work: see bargello work.

Florentine diamond, clear, pale-yellow stone weighing 137 carats; of Indian origin, it was cut as a double rose with 126 facets. Once owned by Charles the Bold, duke of Burgundy, who lost it when he fell in battle in 1477, the stone came into the possession of Pope Julius II and the Medici family early in the 16th century. Maria Theresa of Austria acquired it through her marriage (1736) to the Duke of Tuscany, and it subsequently became part of the Austrian crown jewels. Seized by the Germans when they took over Austria just before World War II, it was recovered by the U.S. 3rd Army and returned to the Viennese by Gen. Mark Clark.

Florentine mosaic: see commesso.

Florentius, Georgius: see Gregory of Tours, Saint.

Flores, capital, Petén department, northern Guatemala, built on San Andrés island in the southern part of Lake Petén Itzá, only 449 ft (137 m) above sea level. Once capital of the Itzá Indians (Mayas who successfully resisted Spanish attempts to conquer them until 1697), Flores is a major trade centre for the Petén region. Chicle, timber, rubber, sugarcane, and cacao are the principal products of the hinterland. Access to the town was very difficult until the opening of an airport on the mainland and the building of a causeway for road traffic. Roads lead from Flores across Petén north and northwest to Mexico, east to Belize, and south to the Guatemalan highlands. It is the point of departure for expeditions to the many Mayan sites in the department. Pop. (2001 prelim.) mun., 12,600.

Flores, one of the Lesser Sunda Islands in Nusa Tenggara Timur *propinsi* (East Nusa Tenggara province), Indonesia. The last major island in the chain, which extends eastward from Java, it is long and narrow, 5,500 sq mi (14,250 sq km) in area, and has numerous inlets and bays. The island was named after the Portuguese name for the island's eastern cape, Capo de Flores (Cape of Flowers), after the flamboyants (*Poinciana regia*) found in profusion there. It is very mountainous, especially in the west, where Poco (peak) Mandasawu reaches 7,900 ft (2,400 m). Several active volcanoes are in the centre and east. Near Ende, historically the main city and once a mission centre, is Mt. Kelimutu, the "mountain of the three coloured lakes." In May 1974 a volcanic eruption on nearby Mt. Iya caused one of the lakes—the blue-white one—to change to a reddish colour, similar to the other two. The island's interior has been little explored. The rivers are unnavigable. Most of the vegetation consists of either tropical deciduous forest or savanna, and the western end was formerly a haunt of a giant lizard.

The indigenous people are mainly mixed Malay-Papuan, more Malay in the west, more Papuan elsewhere, making the island a transitional area. Coastal settlers reflect immigration from many areas: there are Bimanes, Sumbanese, Sumbawanese, Buginese, Makasarese, Solorese, Minangkabau, and Javanese-Chinese at different sites on the coast of Flores. Although there are Muslims, primarily in coastal areas around Mangarai and Ende, and Christians, descendants of people converted by the Portuguese in the 16th century, the majority of the population still practice traditional animist religions. In the west, houses are built on terraces, often on piles; neat and regular in arrangement and surrounded by a bamboo hedge, they are divided into separate rooms for different families, with a sleeping passage for unmarried men and strangers. In the east, houses are smaller and inhabited by only one family, while in Ende they are square, roomy, and well built. Land generally is owned communally by the tribe, and the headman has great power.

Agriculture is mainly by shifting cultivation; sticks are used to turn over the soil. The chief food crop is corn (maize); there is commercial production of coconuts in coastal regions and of coffee in the hills. Frequent burning for field plots and for hunting, together with the semi-arid climate, account for the small area—only 3 percent—of genuine forest, the remainder being scrub and savanna. About 5 percent of Flores is in temporary fields, while less than 1 percent is in permanent wet rice fields. Most inhabitants are chronically underfed.

Flores was once tributary to the princes of Celebes (Sulawesi); though their power was broken by the Dutch in 1667, the latter did not firmly establish civil government on the island until 1909. A fair-weather road (still more

heavily utilized by horse-drawn carts than by motor vehicles) was completed in 1926 and traverses the island in a west-east direction; there is airline service to Ende on the southern coast and to Maumere on the northern coast. Pop. (1990), including Komodo and other adjacent small islands, 1,429,025.

Flores, *departemento*, south-central Uruguay. The rolling hills of the territory culminate in the east-west-trending Grande Inferior Range (Cuchilla Grande Inferior) and are drained by the Yi River and the Arroyo (stream) Chapi-cuy Grande. Economic activity centres around livestock raising and agriculture. Sheep ranching is widespread, and wool is a leading product of the *departemento*; wheat, corn (maize), linseed, oats, and fruits are cultivated. Flores is traversed south-north by the highway linking Montevideo and Paysandú. A branch railroad from Durazno leads to Trinidad, the capital. Area 1,986 square miles (5,144 square km). Pop. (1996) 25,348.

Flores, Isabel de: *see* Rose of Lima, Saint.

Flores Island, Portuguese ILHA DAS FLORES, westernmost island of the Portuguese Azores archipelago, in the North Atlantic. It lies within Horta administrative district and forms, together with the Ilha do Corvo, the Santa Cruz group. The island has an area of 55 square miles (142 square km), is volcanic in origin, and rises from sea level to 3,087 feet (941 m) at Morro Grande in its centre. It has numerous crater lakes that offer good fishing and is noted for its lush flora (whence its name). The economy is based on cattle raising and dairying. The French government has established a space-aeronautics base near the island capital, Santa Cruz. Pop. (1991) 4,316.

Flores Sea, Bahasa Indonesia LAUT FLORES, portion of the western South Pacific Ocean, bounded on the north by the island of Celebes (Sulawesi) and on the south by the Lesser Sunda Islands of Flores and Sumbawa. Occupying a total surface area of 93,000 square miles (240,000 square km), it opens northwest through Makassar Strait to the Celebes Sea, west to the Java Sea, and east to the Banda Sea. Teluk (gulf of) Bone cuts deeply into the Celebes coast. The sea's basin is divided into four distinct regions. One, in the west, is a broad plateau with a general depth of 1,650 feet (500 m). Submarine mounts rising from this bank are often capped by coral atolls. Two deeper channels cross this region, leading southeast to the Flores Basin (just north of the island of Flores). There the sea plunges to its greatest depth, 16,860 feet (5,140 m). Extending north of the trough, two ridges (the western reaching above water as Selayar Island), flanking a shallower trough (maximum 11,060 feet [3,370 m]), stretch to the island of Celebes. The last region, south of Teluk Bone, is on the east, bordering the Banda Sea. In the winter, surface currents trend southwest only to reverse themselves during the summer.

Florey, Howard Walter Florey, Baron (b. Sept. 24, 1898, Adelaide, Australia—d. Feb. 21, 1968, Oxford, Eng.), Australian pathologist who, with Ernst Boris Chain, isolated and purified penicillin (discovered in 1928 by Sir Alexander Fleming) for general clinical use. For this research Florey, Chain, and Fleming shared the Nobel Prize for Physiology or Medicine in 1945.

Florey studied medicine at Adelaide and Oxford universities until 1924. After holding teaching and research posts at Cambridge and Sheffield universities, he was professor of pathology at Oxford (1935–62). He was appointed provost of Queen's College, Oxford (1962), and chancellor of the Australian Na-

Florey
Camera Press

tional University, Canberra (1965), positions he held until his death. He was knighted in 1944 and made life peer in 1965.

Florey investigated tissue inflammation and secretion of mucous membranes. He succeeded in purifying lysozyme, a bacteria-destroying enzyme found in tears and saliva, and characterized the substances acted upon by the enzyme. In 1939 he surveyed other naturally occurring antibacterial substances, concentrating on penicillin. With Chain, he demonstrated its curative properties in human studies and developed methods for its production. Following World War II and the work of his research team in North Africa, penicillin came into widespread clinical use.

Flórez (de Setién y Huidobro), Enrique (b. July 21, 1702, Villadiego, Spain—d. May 5, 1773, Madrid), Spanish historian and representative figure in the movement to reform education under Charles III; he was the major scholar behind the 51-volume *España sagrada* ("Sacred Spain"), a monument of 18th-century historiography.

In 1718 Flórez entered the Augustinian order and studied philosophy with the priests of Piedrahita, moving a year later to teach in the Augustinian college of Salamanca. After earning his doctorate from the universities of Santo Tomás, Ávila, and Alcalá, he moved further from strictly theological studies and dedicated himself to historical scholarship. Named rector of the Colegio de Alcalá in 1739 and supported by a pension from Charles III, he undertook a series of expeditions around the Iberian peninsula in 1754. Out of these journeys came much of the material for his *España sagrada* (1754–1879), of which he himself completed 29 volumes. An encyclopaedic collection of ecclesiastical manuscripts, charters, and documents contained in Spanish archives, the work is endowed with a critical sense and method-

ological strictness. Twenty-two subsequent volumes were completed by his successors.

In addition to the *España sagrada*, Flórez wrote the *Clave historial* (1743; "Key to Historical Methodology"), a discourse on methods of writing history; the *Memorias de las reinas católicas* (1761; "Memoirs of the Catholic Queens"), a genealogical account of Catholic queens in the Castilian line from the Goths until the reign of Charles III; and several memoranda on the conservation of books and publication of ancient manuscripts.

Florian, Latin in full MARCUS ANNIUS FLORIANUS (b. Aug. 19, 232—d. Sept. 9, 276), Roman emperor from June to September 276. The brother, by a different father, of the emperor Tacitus, he at once seized power on the death of his brother. Although his action was tolerated by the Senate and the armies of the West, the legions in Syria promoted their own general, Probus. A civil war broke out but ended in the sudden death of Florian, either at the hands of his own soldiers or by suicide.

Florianópolis, city, west central Piauí state, north-eastern Brazil, on the Rio Parnaíba, at 280 feet (85 m) above sea level. Florianópolis was elevated to city status in 1897. It is a trade centre with livestock raising and the extraction of carnauba wax as the principal economic activities. Chemicals and textiles are also produced there. Florianópolis is bridged to Barão de Grajaú, just across the river in Maranhão state, and is linked by road to other urban centres. It serves as a river port 115 miles (185 km) south of Teresina, the state capital, and has an airport. Pop. (2000 est.) 46,700.

Florianópolis, port city and capital, Santa Catarina state, southern Brazil. The city lies on the west coast of Santa Catarina Island and is linked to the mainland by the Hercílio Luz Bridge (1926), a suspension bridge (2,788 feet [846 m]) that is one of the longest bridges in Brazil.

The first European settlement on the island was made in 1542 by Spaniards, but in 1675 control passed to the Portuguese, who established Desterro on the present city site in 1700. The settlement was given town status in 1726 and was raised to city rank in 1823. In 1893 the island was captured by revolutionaries who opposed the government of Brazilian president Floriano Peixoto. When the revolution collapsed, the city was renamed to honour the president.

Central Florianópolis consists mainly of wharves, warehouses, and business establishments. This older harbour district is encircled by a modern residential section known as

Old harbour district, Florianópolis, Braz., on Santa Catarina Island, with the Hercílio Luz Bridge in the background

Plessner International

Praia de Fora, built on hill slopes. Florianópolis is the seat of the Federal University of Santa Catarina (1960) and Santa Catarina State University (1966), and its museums include the Anthropological Museum and the San Jaqui Museum. The city serves as the state administrative and commercial centre despite the problems of access to the interior caused by the unusually steep escarpment at the edge of the Serra do Paraná on the mainland. Its industries process metals and make electrical communications equipment, pharmaceuticals, plastics, and perfume. Because of reduced water levels, however, Florianópolis is no longer the major port of Santa Catarina state. It is linked with other coastal towns, such as Curitiba and Pôrto Alegre, by all-weather highways and ships. There is air service to São Paulo, Rio de Janeiro, and Pôrto Alegre. Pop. (1996) 250,657.

Florida, city, central Camagüey *provincia*, east-central Cuba. Lying just north of the Muñoz River, Florida is a rail junction and manufacturing centre for the surrounding agricultural and pastoral lands. The principal agricultural products of the area are sugarcane and oranges. Cattle also are raised. Large sugar refineries are located on the outskirts of Florida, which is on the central highway and a major railroad. Pop. (1991) 51,827.

Florida, constituent state of the United States of America, the southeasternmost state of the United States, comprising a peninsula and adjoining mainland areas protruding southeastward from the North American continent. It is bounded on the north by Alabama and Georgia; on the east by the Atlantic Ocean; on the south by the Straits of Florida; and on the west by the Gulf of Mexico. The capital is Tallahassee. Area 58,680 square miles (151,981 square km). Pop. (2000) 15,982,378.

A brief treatment of Florida follows. For full treatment, see MACROPAEDIA: United States of America: *Florida*.

Indian groups entered Florida from the north as early as 10,000 years ago. Florida was explored by Juan Ponce de León in about 1513. In 1565, after wiping out a settlement of French Huguenots, the Spaniards founded St. Augustine, the oldest city in the United States. By 1750 virtually all of the descendants of the earliest known inhabitants had been extirpated. Florida became a British possession in 1763 after the British victory in the French and Indian Wars. The area reverted to Spanish control after the American Revolution (1783) but was used by the British as a base of operations against the United States during the War of 1812. Andrew Jackson's capture of Pensacola during that war led to the cession of Florida to the United States in 1819. A war with the Seminole Indians followed (1835–42) during which most Seminoles were forcibly removed to Oklahoma. Florida became a state in 1845.

Florida is a low-lying plain, mostly less than 100 feet (30 m) above sea level, with its highest point a mere 345 feet (105 m) in elevation. Sedimentary deposits of sand and limestone cover most of the state, with areas of peat and muck marking where freshwater bodies once stood. Almost two-thirds of the state is covered by trees, and there are more than 1,700 streams and some 30,000 lakes. The contemporary topography has been largely molded by running water, waves, ocean currents, winds, changes in sea level, and the wearing away of limestone rocks. The rich and distinctive tropical and subtropical environment is inhabited by a huge and varied wildlife population.

Climatically, Florida is divided into tropical and subtropical zones. Average annual temperatures show little variation, ranging from 68° F (20° C) in the north to 77° F (25° C) in the south. Rainfall is heaviest in summer. The average annual rainfall ranges from 40 inches (1,000 mm) around Key West to 62 inches

(1,575 mm) in West Palm Beach. On the average, hurricanes occur about once a year, usually in September.

Florida is one of the fastest-growing states in the United States. Its 1970–85 growth rate was almost four times the national average. When it became a state, Florida was sparsely populated and had equal numbers of whites and blacks; at the end of the 19th century, the proportion of blacks began a steady decline. It is now about 15 percent. Immigrants from Cuba have been significant throughout the 20th century. Sizable Jewish communities have also developed, as have recent communities of Haitian refugees. The death rate is high mainly because of the large number of older people who have retired there.

Florida's farmland covers less than two-fifths of the state, and about one-third of this total is in either pasture or timber. Yet on this land Florida produces about 75 percent of the nation's citrus fruits, and the state is second only to California in vegetable production. It also is important in cattle raising. Phosphate is the state's main mineral; titanium and zircon are also found, and there is some petroleum.

Tourism is the leading industry. The electronics industry is the leading manufacturing activity. The aerospace industry, centred on the John F. Kennedy Space Center at Cape Canaveral (Kennedy), is a further buttress to the economy, employing many thousands.

Florida has three international airports and eight major deepwater ports and is well-served by highways and railways. It maintains more than 800 parks and recreation areas, while counties and municipalities support another 1,300. Everglades National Park occupies 2,356 square miles (6,102 square km). Sporting events, particularly the Orange Bowl and Gator Bowl football games, are especially popular. Walt Disney World, Universal Studios, and other venues in the Orlando area are huge tourist attractions. Sarasota is a centre for both visual and theatre arts. The John and Mable Ringling Museum of Art possesses an internationally famous fine-art collection, and the city also supports a circus museum and hall of fame.

Florida, city, south-central Uruguay, on the Santa Lucia Chico Riv. Founded in 1809, the city processes the wheat, corn (maize), oats, sugar beets, linseed, and other products of the agricultural hinterland. Lumber mills and factories manufacturing textiles, mosaics, and hosiery also are located in the city.

The surrounding region is characterized by rolling hills. In addition to its agricultural activities, the area is noted for cattle and sheep ranching. Viticulture, dairying, and quarrying of granite, limestone, marble, and iron are also economically important. The city of Florida has a poultry-farming school. Florida is situated on the main highway and railroad linking Montevideo and Rivera, and it has an airport. Pop. (1996) 31,450.

Florida, Purchase of: see Transcontinental Treaty.

Florida, Straits of, passage connecting the Gulf of Mexico with the Atlantic Ocean, extending for about 110 miles (180 km) between the Florida Keys, U.S., on the north and Cuba and the Bahamas on the south and southeast. The straits mark the area where the Florida Current, the initial part of the Gulf Stream, flows eastward out of the Gulf of Mexico with a mean surface velocity of 4 to 6 miles (6.5 to 9.5 km) per hour and a width of up to 95 miles (153 km). The Spanish explorer Juan Ponce de León first recorded sailing through the straits in 1513.

Florida Bay, triangular-shaped shallow body of water between the Gulf of Mexico and Biscayne Bay at the southern end of Florida, U.S. The bay is partially sheltered from the Atlantic

Ocean on the south and east by the Florida Keys. Its depth is generally less than 11 feet (3 m), and many of the mudbanks are high enough to form small islands. Navigation channels have been dredged through the bay to accommodate the Atlantic Intracoastal Waterway. Most of the bay is included within the Everglades National Park.

Florida Current, swift surface oceanic current flowing northward, following the shallow continental slope between the Straits of Florida and Cape Hatteras. Emerging from the Caribbean Sea, carrying about 880,000,000 cubic feet (25,000,000 cubic m) of water per second, the Florida Current is joined by the Antilles Current, which transports approximately 420,000,000 cubic feet (approximately 11,893,000 cubic m) per second. Florida Current water is recognized by its low salinity and temperatures above 44° F (6.5° C).

Florida Keys, island chain, in Monroe and Dade counties, southern Florida, U.S. Composed of coral and limestone, the islands curve southwesterly for about 192 miles (309 km) into the Gulf of Mexico from Virginia Key, just south of Miami Beach, to Loggerhead Key in the Dry Tortugas (*q.v.*). Waters between the keys and the mainland include Biscayne and Florida bays. The western terminus of the Florida Keys is sometimes considered to be Key West (*q.v.*), the most important of the is-

One of the Florida Keys, viewed from Stock Island, near Key West, Fla.

David Muench—EB Inc.

lands. The Overseas Highway, running from the mainland to Key West, is the longest over-water road in the world, with 42 bridges, including one 7-mile (11-kilometre) span; completed in 1938, the highway was built over the route of the Florida East Coast Railroad, begun in 1912 by Henry M. Flagler and destroyed by the 1935 hurricane. Largest of the keys is Key Largo, about 30 miles (50 km) long. The John Pennckamp Coral Reef State Park, which contains the largest living coral formations in North America, is the first undersea park in the United States. It is 21 miles (34 km) long and 6.5 miles (about 10 km) wide and lies along Key Largo's east coast. Islamorada, on Upper Matecumbe Key, has a monument to World War I veterans and victims of the 1935 hurricane. The largest town of the middle keys is Marathon, a centre of extensive resort development. Nearby is the Southeast Museum of the North American Indian and a porpoise-training school. Bahia Honda State Park, on Bahia Honda Key, has 77 acres (31 hectares) of tropical palms and beach recreation facilities. The northern shores of the lower keys have been designated the Great White Heron National Wildlife Refuge. The 7,700-acre (3,116-hectare) Big Pine Key, largest of the lower keys, is a refuge for the tiny key deer and has unusual displays of cacti. More than 600 varieties of fish are found in the waters of the keys.

Florida torreyana (tree): see stinking yew.

Floridablanca, José Moñino y Redondo, conde de (count of) (b. Oct. 21, 1728, Murcia, Spain—d. Dec. 28?, 1808, Seville), Spanish statesman and minister who became identified with the reform program of King Charles III.

He was a leading advocate in Madrid when he was appointed fiscal of the council of Castile in 1766. Having cooperated in the expulsion of the Jesuits from Spain in 1767 and being known as a convinced regalist, he was sent as ambassador to Rome in 1772 with the purpose of procuring the general dissolution of the Society of Jesus. As a reward for his success in this mission, Charles III gave him the title of conde de Floridablanca in 1773.

He replaced Jerónimo Grimaldi as first secretary of state in 1776. In office he attacked the problem of mendicity, sponsored vocational schools and workhouses, established public credit agencies to lend capital to farmers, and was involved in most of the reforming efforts of the government in trade, industry, agriculture, and public works. Wishing to create a more efficient instrument of government, Floridablanca persuaded the king to establish (July 8, 1787) a *junta de estado*, or type of cabinet, which began regular joint meetings of all the royal ministers in order to discuss and coordinate policy and for which he himself drew up a program of action.

Charles IV retained Floridablanca in office upon his accession (1789) but the minister's policy now changed. The growing horror of the French Revolution transformed him from a progressive into an authoritarian, leading him to resuscitate the Inquisition, to impose a rigorous censorship, and to disavow the ministers and institutions of the late king. Aristocratic resentment of his power and humble origin, together with his intransigent policy toward France which was thought to endanger the royal family there, led to his being replaced by the Conde de Aranda in February 1792. At first Floridablanca was allowed to return to his native Murcia, but he was arrested in July and confined in the fortress of Pamplona, where he remained until permitted to retire to Murcia. During the French invasion of 1808 he was nominated president of the supreme central junta but died soon after.

Floridor, original name JOSIAS DE SOULAS, SIEUR (lord) DE PRINEFOSSE (b. 1608?, the Brie district, Fr.—d. August 1671, Paris), French leading actor who headed the important troupe of the Théâtre de l'Hôtel de Bourgogne, in Paris, where he created many roles in plays by the French masters Pierre Corneille and Jean Racine.

The son of a German father, he entered the French army and was promoted to ensign but later resigned to become an actor under the name of Floridor. He joined a group of players that performed in London in 1635 before the English court and at the French Players' Theatre, a playhouse temporarily set up in Drury Lane, London. For a brief time he was affiliated with Filandre (Jean-Baptiste de Mouchaingre), an influential French actor-manager, who was reputed to have been his teacher and with whom he made provincial tours. During that period, he joined the troupe at the Théâtre du Marais, with whom he made his Parisian debut in 1640.

Floridor was called (around 1643) to the Hôtel de Bourgogne, a move that possibly influenced Corneille to give that theatre his later plays instead of giving them to the Marais. He succeeded the French actor Bellerose (Pierre le Messier) as head of the Bourgogne, where he played all the leading parts in tragedy and comedy, becoming one of France's finest actors. His company was unrivalled in Paris until Molière's arrival there in 1658. Molière's

play *L'Impromptu de Versailles* (1663), which ridiculed the Bourgogne troupe, spared only Floridor from mockery. He retired, because of illness, shortly before his death.

Flórina, also spelled PHLÓRINA, historically CHLOROS, city, capital of the *nomós* (department) of Flórina, western Macedonia, Greece. Originally a Byzantine foundation, it later passed to Ottoman control; by the 18th century, its population was chiefly Turkish and Albanian. In the 19th century, Flórina was a centre of Bulgarian irredentist agitation in Macedonia. It passed to Greece after the Balkan Wars (1912-13). Located in a fertile agricultural area, Flórina markets grain, wine grapes, and vegetables. It has textile mills and is known for fine leather handicrafts.

The *nomós* of Flórina extends along the Yugoslav and Albanian frontiers; it includes the Greek portions of Lake Prespa and Limni (lake) Mikrá Préspa. Kaolin, marble, lignite, and bauxite are mined. Pop. (1991) city, 12,355; *nomós*, 53,147.

Florio, John, also called GIOVANNI FLORIO (b. c. 1553, London—d. c. 1625, Fulham, near London), English lexicographer and translator of Montaigne.

Florio, engraving by William Hole, 1611

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

Son of a Protestant refugee of Tuscan origin, Florio studied at Oxford. From 1604 to 1619 Florio was groom of the privy chamber to Queen Anne.

In 1580 he translated, as *Navigations and Discoveries* (1580), Giovanni Battista Ramusio's account of the voyages of Jacques Cartier. *Florio His Firste Fruites* (1578), a grammar and a series of dialogues in Italian and English, was followed by *Florio's Second Frutes* and a collection of proverbs in *Giardino di Ricreatione* in 1591. His Italian-English dictionary, *A Worlde of Wordes* (1598), for which he drew heavily upon the works of Giordano Bruno, contains about 46,000 definitions. The second edition, *Queen Anna's New World of Wordes* (1611), was greatly enlarged.

In 1603 Florio produced his major translation, *The Essayes . . . of . . . Montaigne*. The freedom of this version is questionable by modern standards of accuracy, and the style is elaborate where Montaigne is subtle and terse, but the book is nevertheless thoroughly good reading. Florio revised it in 1613.

Floris V, byname FLORIS THE GOD OF THE COMMONERS, Dutch FLORIS DER KEERLEN GOD (b. July 1254, Leiden, Holland—d. June 27, 1296, Muiderberg), count of Holland (1256-96) and Zeeland, son of the German king William of Holland. Under him the territory of Holland greatly expanded and prospered. Floris succeeded his father as count of Holland when he was less than two years old and did not come of age until 1266.

The county was enlarged by the final subjugation of the West Frisians in 1289 and by the acquisition of Waterland, West Frisia, the diocese of Utrecht, and Gooi and by forcing several feudal lords in the borderlands to recognize Floris as their overlord (Amstel, Woerden). The county became more or less coextensive with the later provinces of North and South Holland. Careful maintenance of waterways and dikes increased the agrarian importance of the country. Before his successes on his frontiers, Floris V had had to suppress a revolt of the peasants in the north of Holland (1273-74).

His active interest in affairs was not limited to the Netherlands. He allied himself closely with Edward I of England in his strife with France and secured from the English king great trading advantages for his people; the staple of wool was placed at Dort (Dordrecht), and the Hollanders and Zeelanders got fishing rights on the English coast. So intimate did their relations become that Floris sent his son John to be educated at the court of Edward with a view to his marriage with an English princess. However, Floris in 1296 transferred his alliance to Philip IV of France, probably at the prompting of his cousin John of Avesnes, count of Hainaut, since John and Philip were both hostile to the count of Flanders, Guy of Dampierre, who was also Floris' adversary. This tergiversation was the cause of Floris V's death; discontented nobles, encouraged by the English king, took him prisoner, and, when the peasantry prevented them from taking him to England, killed him in the castle of Muiden. The tragic event has been immortalized in dramas from the pens of some of Holland's most famous writers.

Floris, Cornelis II and Frans, original names CORNELIS DE VRIENDT II and FRANS DE VRIENDT (respectively b. 1514, Antwerp—d. Oct. 20, 1575, Antwerp; b. c. 1516, Antwerp—d. Oct. 1, 1570, Antwerp), the most distinguished members of a family of Flemish artists;

"Fall of the Rebel Angels," central wood panel of triptych by Frans Floris in the Koninklijk Museum voor Schone Kunsten, Antwerp

By courtesy of the Koninklijk Museum voor Schone Kunsten, Antwerp, Belgium

their Antwerp workshops contributed significantly to the Northern Renaissance. Cornelis was an architect, sculptor, and medalist; Frans, a painter.

Both brothers studied in Rome in the 1540s and were soon at the head of flourishing workshops in Antwerp. Cornelis flourished the

choir screen of Tournai Cathedral and the tombs of Danish kings Frederick I (Schleswig, Ger.) and Christian II (Roskilde, Den.). He designed the Antwerp town hall (1561–65); its amalgamation of a Gothic gable front with a Florentine palace facade became the model for Netherlandic town halls. Frans's success was even more phenomenal, thanks to his ability to organize an efficient picture-producing factory. His life-style was extravagant, and he died overwhelmed with debts.

Florissant, city, St. Louis county, east-central Missouri, U.S. A northern suburb of St. Louis, it lies near the Missouri River. Settled by the French in about 1785, it was called St. Ferdinand by the Spanish and was officially renamed Florissant (from the French *fleurissant*, "flowering") in 1939. The Old St. Ferdinand's Shrine (a Roman Catholic church) was built in 1821, St. Stanislaus Seminary was founded by the Jesuits in 1831, and St. Louis Christian College was opened in 1956. Casa Alvarez (c. 1790) survives as an example of Missouri French architecture. Inc. 1857. Pop. (1991 est.) 51,615.

Florissant Formation, division of middle and upper Oligocene rocks in the United States (the Oligocene Epoch lasted from 36.6 to 23.7 million years ago). The Florissant Formation occurs in central Colorado, where it overlies the White River Group; it was named for exposures studied near Florissant, Colo. The Florissant consists of shales that contain a rich and varied fossil assemblage. Many kinds of Oligocene plants are represented in the Florissant, including the leaves and twigs of redwoods, hackberries, and sycamores. These remains represent a temperate upland forest that existed in the region during the Oligocene. Well-preserved fish skeletons have been found in the fine-grained Florissant sediments, as have freshwater mollusks and an excellently documented record of Oligocene insects and spiders. The Florissant contains the earliest record of the tsetse fly and some mammalian fossils.

floristic region, also called FLORISTIC KINGDOM, or FLORAL KINGDOM, any of six areas of the world recognized by plant geographers for their distinctive plant life. These regions, which coincide closely with the faunal regions (*q.v.*) as mapped by animal geographers, are often considered with them as biogeographic regions. The chief difference is the recognition by plant geographers of the Cape region of South Africa as a distinct major unit because of its rich flora, which includes more than 1,500 genera, 30 percent of which are native nowhere else in the world.

The regions are: Boreal (North America, Europe, northern and central Asia, and North Africa), Palaeotropical (including African, Indo-Malaysian, and Polynesian subregions), Neotropical (South and Central America), South African, Australian, and Antarctic.

The Australian region is the most isolated, followed closely by the South American portion of the Neotropical region. Both of these areas contain a large number of unique plant species. Madagascar, long separated from Africa, is sometimes considered a separate region because of its unusual flora.

Florus, Publius Annii (fl. late 1st and early 2nd century AD, b. Africa—d. Rome?), historian of Rome and poet, important as the first of a number of African writers who, in the 2nd century, exercised considerable influence on Latin literature. He was also the first of the "new-fashioned" poets of Hadrian's reign, whose special characteristic was the use of lighter and more graceful metres than those of the poets they displaced.

Florus compiled a brief sketch of the history of Rome from its founding to the time of Augustus, based chiefly on Livy. The work, called in some manuscripts *Epitome de T.*

Livio bellorum omnium annorum DCC libri duo, is a rhetorical panegyric of the greatness of Rome. Almost valueless historically, it was much used in the Middle Ages. In the manuscripts the writer is variously identified, but stylistic similarity to a dialogue *Vergilius orator an poeta* known to be the work of Publius Annii Florus, of which a fragment is preserved, authenticates his authorship of the history. The *Vergilius* states that he took part in the contest of poets instituted by the emperor Domitian in honour of Capitoline Jove. Having been refused a prize because of the prejudice against African provincials, he went to Tarraco, Spain, where he taught rhetoric. At some time he must have returned, because it is generally agreed that he is the Florus said to have addressed the well-known lines to Hadrian beginning, "I do not wish to be a Caesar," which provoked Hadrian's satirical parody, "I do not wish to be a Florus," quoted by Spartianus. Twenty-six trochaic tetrameters, *De qualitate vitae*, and five graceful hexameters, *De rosis*, are also attributed to him.

Flory, Paul J., in full PAUL JOHN FLORY (b. June 19, 1910, Sterling, Ill., U.S.—d. Sept. 9, 1985, Big Sur, Calif.), American physical chemist, recipient of the Nobel Prize for Chemistry in 1974 for his investigations of synthetic and natural macromolecules.

Flory attended Manchester College, North Manchester, Ind., and Ohio State University (Ph.D., 1934). Thereafter he worked at the University of Cincinnati, Cornell University in Ithaca, N.Y., Standard Oil Development Company, and Goodyear Tire & Rubber Company. His scientific activities ranged from research and development that led to the introduction of commercially successful polymers (nylon and synthetic rubber) to studies of processes by which polymers form and of their properties in bulk and in solution. His research demonstrated the importance of understanding the sizes and shapes of these flexible molecules in establishing relationships between their chemical structures and their physical properties. From 1961 to 1976 he was a professor of chemistry at Stanford University, becoming emeritus in 1976.

Flossenbürg, German Nazi concentration camp, established in 1937 in the market town of Flossenbürg, in the Neustadt district of the Upper Palatinate of Bavaria (Bayern). It was originally used for political prisoners but, by World War II, had become an important forced-labour centre, housing 30,000 to 40,000 worker-prisoners in the main camp and 15 satellite camps. From 1942 on, it was also a transit camp for Jews destined for the extermination camps in Poland.

flotation, in mineral processing, method used to separate and concentrate ores by altering their surfaces to a hydrophobic or hydrophilic condition—that is, the surfaces are either repelled or attracted by water. The flotation process was developed on a commercial scale early in the 20th century to remove very fine mineral particles that formerly had gone to waste in gravity concentration plants. Flotation has now become the most widely used process for extracting many minerals from their ores.

Most kinds of minerals require coating with a water repellent to make them float. By coating the minerals with small amounts of chemicals or oils, finely ground particles of the minerals remain unwetted and will thus adhere to air bubbles. The mineral particles are coated by agitating a pulp of ore, water, and suitable chemicals; the latter bind to the surface of the mineral particles and make them hydrophobic. The unwetted particles adhere to air bubbles and are carried to the upper surface of the pulp, where they enter the froth; the froth containing these particles can then

be removed. Unwanted minerals that naturally resist wetting may be treated so that their surfaces will be wetted and they will sink.

This ability to modify the floatability of minerals has made possible many otherwise difficult separations that are now common practice in modern mills. Flotation is widely used to concentrate copper, lead, and zinc minerals, which commonly accompany one another in their ores. Many complex ore mixtures formerly of little value have become major sources of certain metals by means of the flotation process.

Flotow, Friedrich, Baron (Freiherr) von (b. April 26, 1812, Teutendorf, near Lübeck, French Empire [now in Germany]—d. Jan. 24, 1883, Darmstadt, Ger.), German-born French composer best known for his opera *Martha*.

Originally intended for a diplomatic career, Flotow studied music in Paris with Anton Reicha from the age of 16. Forced to leave Paris during the July Revolution of 1830, he

Flotow, detail of a lithograph by J. Kriehuber, 1847

By courtesy of the Österreichische Nationalbibliothek, Vienna

went home but returned to Paris in 1831. In 1837 he produced a first, brief version of the opera *Alessandro Stradella*, which later, in its complete form, enjoyed great success. In 1839 he collaborated with Albert Grisar and Auguste Pilati on *Le Naufrage de la Méduse* ("The Wreck of the Medusa"). Between 1840 and 1878 he produced 19 light operas. *Martha* (1847) was originally a ballet entitled *Lady Henriette* that was first performed at the Paris Opéra in 1844. Appealing by its melodic charm, *Martha* won a place in the operatic repertory. Flotow also wrote ballets for the court theatre at Schwerin, of which he was director (1855–63), and incidental music for William Shakespeare's *The Winter's Tale*.

flounder, any of numerous species of flatfishes belonging to the families Pleuronectidae and Bothidae (order Pleuronectiformes). The flounder is morphogenetically unusual. When born it is bilaterally symmetrical, with an eye on each side, and it swims near the surface of the sea. After a few days, however, it begins to lean to one side, and the eye on that side begins to migrate to what eventually becomes the top side of the fish. With this development a number of other complex changes in bones, nerves, and muscles occur, and the underside of the flounder loses its colour. As an adult the fish lives on the bottom, with the eyed side uppermost.

Included among the approximately 100 species of the family Pleuronectidae are the European flounder (*Platichthys flesus*), a marine and freshwater food and sport fish of Europe that grows to a length of 50 cm (20 inches) and weight of 2.7 kg (6 pounds); the starry flounder (*Platichthys stellatus*), a North Pacific species that averages about 9 kg (20 pounds) in weight; and the winter flounder (*Pseudopleuronectes americanus*), an Ameri-

can Atlantic food fish, growing to about 60 cm (23 inches) in length. Flounders in this family typically have the eyes and colouring on the right side.

In the family Bothidae, containing about 200 species, the better-known flounders include the summer flounder (*Paralichthys dentatus*), an American Atlantic food fish growing to about 90 cm (35 inches); the peacock flounder (*Bothus lunatus*), a tropical American Atlantic species attractively marked with many pale blue spots and rings; and the brill (*Scophthalmus rhombus*), a relatively large commercial

Flounder (*Platichthys*)
F. Greenaway from Natural History Photographic Agency

European species, reaching a length of 75 cm (29 inches). Flounders in the family Bothidae typically have eyes and colouring on the left side. *See also* flatfish.

flour, finely ground cereal grains or other starchy portions of plants, used in various food products and as a basic ingredient of baked goods. Flour made from wheat grains is the most satisfactory type for baked products that require spongy structure. In modern usage, the word flour alone usually refers to wheat flour, the major type in Western countries.

A brief treatment of flour and flour milling follows. For full treatment, *see* MACROPAEDIA: Food Processing.

Wheat grains, or kernels, are composed of the starchy endosperm, or food-storage portion, constituting about 85 percent; several outer layers that make up the bran, constituting about 13 percent; and the oily germ, or embryo plant, approximately 2 percent. In the production of refined flour, the purpose of the milling process is to separate the endosperm from the other kernel portions. In the production of whole wheat flour, all parts of the kernel are used.

In modern milling of refined flours the wheat kernels are cleaned and tempered by the addition or removal of moisture and then split open by a pair of rolls. The finest particles, called break flour, are sieved out and bagged. Coarser particles of endosperm (called semolina) and pieces of bran with endosperm attached are then subjected to a series of rolls in which semolina of steadily reducing size is gradually ground to flour and the bran separated out. The flour is usually bleached and treated to obtain the improved bread-making qualities formerly achieved by natural aging. Flour grades are based on the residual amount of branny particles.

When flour is mixed with water to make dough, its protein content is converted to gluten, an elastic substance that forms a continuous network throughout the dough and is capable of retaining gas, thus causing the baked product to expand, or rise. The strength of the gluten depends upon the protein content of the flour. Soft wheats, containing approximately 8–12 percent protein, produce flours that are suitable for products requiring minimal structure, such as cakes, cookies (sweet biscuits), piecrusts, and crackers. Hard wheats, which are high in protein (approximately 12–15 percent), produce flours that are suitable

for products requiring stronger structure, such as breads, buns, hard rolls, and yeast-raised sweet rolls.

The wide variety of wheat flours generally available includes whole wheat, or graham, flour, made from the entire wheat kernel and often unbleached; gluten flour, a starch-free, high-protein, whole wheat flour; all-purpose flour, refined (separated from bran and germ), bleached or unbleached, and suitable for any recipe not requiring a special flour; cake flour, refined and bleached, with very fine texture; self-rising flour, refined and bleached, with added leavening and salt; and enriched flour, refined and bleached, with added nutrients.

Flours are also made from other starchy plant materials including barley, buckwheat, chickpeas, lima beans, oats, peanuts, potatoes, soybeans, rice, and rye.

flour moth, also called MEDITERRANEAN FLOUR MOTH (*Ephestia*, or *Anagasta kuehniella*), species of insect belonging to the family Phycitidae (order Lepidoptera), a cosmopolitan pest of cereal products and other stored foods. Because they require vitamins A and B, the larvae cannot live on pure starch. They spin a web in flour, grain, or seeds, causing problems in milling or sorting. After the small, white maggotlike larvae grow to a length of nearly 2 cm (0.7 inch), they crawl into a crevice to pupate; infestations therefore tend to persist in contaminated warehouses. The adult moths have gray mottled forewings, with a span of about 3 cm (1.2 inches), and pale hind wings. They shun light and fly in brief zigzags. Each female flour moth lays 200 to 500 eggs, producing as many as four generations per year, or more in warmer environments.

Flourens, Gustave (b. Aug. 4, 1838, Paris, France—d. April 3, 1871, Chatou), French radical intellectual and a leader of the Paris Commune revolt of 1871.

Flourens was the son of a famous physiologist, Marie-Jean-Pierre Flourens, and was a promising young scientist. As an academic he wrote such distinguished works as *Histoire de l'homme* (1863; "History of Man"), *Ce qui est possible* (1864; "What Is Possible"), and *Science de l'homme* (1865; "Science of Man"). In 1867 he was denied a professorship at the Collège de France because of his attachment to radical scientific and political doctrines. He had meanwhile left France for Turkey and Greece. In 1866 he joined a revolt in Crete against the Turks and distinguished himself as a guerrilla leader.

Flourens soon returned to France and to political activism. He collaborated on an influential left-wing journal, *La Marseillaise*; fought a duel with Paul de Cassagnac, a right-wing journalist; and led an abortive revolt at the funeral of Victor Noir, an obscure young newspaperman who had been shot by Prince Pierre Bonaparte (January 1870). Flourens was arrested in February 1870 after leading another unsuccessful uprising but was soon released to help defend Paris against the German siege during the Franco-German War (1870–71). Following the capitulation of Paris, he was rearrested that October, once again for revolutionary politics.

Flourens was free when the Paris Commune revolted in mid-March 1871. He quickly joined the revolutionary movement as elected delegate from the 19th *arrondissement* of Paris. He played a key role in the military leadership of the Commune and served on the commission of war, but he was killed during a skirmish at Chatou shortly thereafter.

Flourens, Marie-Jean-Pierre (b. April 15, 1794, Maureilhan, France—d. Dec. 6, 1867, Montgeron), French physiologist who was the first to demonstrate the general functions of the major portions of the vertebrate brain.

After receiving his medical degree from the

University of Montpellier, Flourens went to Paris, where the renowned French naturalist Georges Cuvier became his patron. Under his sponsorship, Flourens conducted a series of experiments (1814–22) to determine physiological changes in pigeons after removal of certain portions of their brains. He found that removal of the cerebral hemispheres, at the front of the brain, destroys will, judgment, and all the senses of perception; that removal of the cerebellum, at the base of the brain, destroys the animal's muscular coordination and its sense of equilibrium; and that removal of the medulla oblongata, at the back of the brain, results in death. These experiments led him to conclude that the cerebral hemispheres are responsible for higher psychic and intellectual abilities, that the cerebellum regulates all movements, and that the medulla controls vital functions, especially respiration. Flourens was also the first to recognize the role of the semicircular canals of the inner ear in maintaining body equilibrium and coordination.

Flourens became professor of comparative anatomy at the museum of the Jardin des Plantes in 1832 and professor at the Collège de France in 1855. He summarized his brain studies in *Recherches expérimentales sur les propriétés et les fonctions du système nerveux dans les animaux vertébrés* (1824; "Experimental Researches on the Properties and Functions of the Nervous System in Vertebrate Animals").

flow: *see* deformation and flow.

flowchart, graphical representation of a process, such as a manufacturing operation or computer operation, indicating the various steps that are taken as the product moves along the production line or the problem moves through the computer. Individual operations can be represented by closed boxes on the flowchart, with arrows between boxes indicating the order in which the steps are taken. *See also* critical path analysis (CPA).

flower, the reproductive portion of any plant in the division Magnoliophyta (Angiospermae), commonly called flowering plants or angiosperms. As popularly used, the term "flower" especially applies when part or all of the reproductive structure is distinctive in colour and form.

In their range of colour, size, form, and anatomical arrangement, flowers present a seemingly endless variety of combinations. They range in size from minute blossoms to giant blooms. In some plants, such as poppy, magnolia, tulip, and petunia, each flower is relatively large and showy and is produced singly, while in other plants, such as aster, snapdragon, calla lily, and lilac, the individual flowers may be very small and are borne in a distinctive cluster known as an inflorescence (*q.v.*). Regardless of their variety, all flowers have a uniform function, the reproduction of the species through the production of seed. The flower is the characteristic structure of the evolutionarily highest group of plants, the angiosperms. (*See also* angiosperm.)

Basically, each flower consists of a floral axis upon which are borne the essential organs of reproduction (stamens and pistils) and usually accessory organs (sepals and petals); the latter may serve to both attract pollinating insects and protect the essential organs. The floral axis is a greatly modified stem; unlike vegetative stems, which bear leaves, it is usually contracted, so that the parts of the flower are crowded together on the stem tip, the receptacle. The flower parts are usually arrayed in whorls (or cycles) but may also be disposed

(Left) Generalized flower with parts; (right) diagram showing arrangement of floral parts in cross section at the flower's base

spirally, especially if the axis is elongate. There are commonly four distinct whorls of flower parts: (1) an outer calyx consisting of sepals; within it lies (2) the corolla, consisting of petals; (3) the androecium, or group of stamens; and in the centre is (4) the gynoecium, consisting of the pistils. (See the Figure.)

The sepals and petals together make up the perianth, or floral envelope. The sepals are usually greenish and often resemble reduced leaves, while the petals are usually colourful and showy. Sepals and petals that are indistinguishable, as in lilies and tulips, are sometimes referred to as tepals. The androecium, or male parts of the flower, comprise the stamens, each of which consists of a supporting filament and an anther, in which pollen is produced. The gynoecium, or female parts of the flower, comprise the pistils, each of which consists of an ovary, with an upright extension, the style, on the top of which rests the stigma, the pollen-receptive surface. The ovary encloses the ovules, or potential seeds. A pistil may be simple, made up of a single carpel, or ovule-bearing modified leaf; or compound, formed from several carpels joined together.

A flower having sepals, petals, stamens, and pistils is complete; lacking one or more of such structures, it is said to be incomplete. Stamens and pistils are not present together in all flowers. When both are present the flower is said to be perfect, or bisexual, regardless of a lack of any other part that renders it incomplete. A flower that lacks stamens is pistillate, or female, while one that lacks pistils is said to be staminate, or male. When the same plant bears unisexual flowers of both sexes, it is said to be monoecious (*e.g.*, tuberous begonia, hazel, oak, corn); when the male and female flowers are on different plants, the plant is dioecious (*e.g.*, date, holly, cottonwood, willow); when there are male, female, and bisexual flowers on the same plant, the plant is termed polygamous.

A flower may be radially symmetrical, as in roses and petunias, in which case it is termed regular or actinomorphic. A bilaterally symmetrical flower, as in orchids and snapdragons, is irregular or zygomorphic.

Neither the calyx nor the corolla is necessary for reproduction. The stamens and pistils, on the other hand, are directly involved with the production of seed. The stamen bears microsporangia (spore cases) in which are developed numerous microspores (potential pollen grains); the pistil bears ovules, each enclosing an egg cell. When a microspore germinates, it is known as a pollen grain. When the pollen sacs in a stamen's anther are ripe, the anther releases them and the pollen is shed. Fertilization can occur only if the pollen grains are transferred from the anther to the stigma of a pistil, a process known as pollination. This is of two chief kinds: (1) self-pollination, the pol-

lination of a stigma by pollen from the same flower or another flower on the same plant; and (2) cross-pollination, the transfer of pollen from the anther of a flower of one plant to the stigma of the flower of another plant of the same species. Self-pollination occurs in many species, but in the others, perhaps the majority, it is prevented by such adaptations as the structure of the flower, self-incompatibility, and the maturation of stamens and pistils of the same flower or plant at different times. Cross-pollination may be brought about by a number of agents, chiefly insects and wind. Wind-pollinated flowers generally can be recognized by their lack of colour, odour, or nectar, while insect-pollinated flowers are conspicuous by virtue of their structure, colour, or the production of scent or nectar.

After a pollen grain has reached the stigma, it germinates, and a pollen tube protrudes from it. This tube, containing two male gametes (sperms), extends into the ovary and reaches the ovule, discharging its gametes so that they fertilize the egg cell, which becomes an embryo. (Normally many pollen grains fall on a stigma; they all may germinate, but only one pollen tube enters any one ovule.) Following fertilization, the embryo is on its way to becoming a seed, and at this time the ovary itself enlarges to form the fruit.

Flowers have been symbols of beauty in most civilizations of the world, and flower giving is still among the most popular of social amenities. As gifts, flowers serve as expressions of affection for spouses, other family members, and friends; as decorations at weddings and other ceremonies; as tokens of respect for the deceased; as cheering gifts to the bedridden; or as expressions of thanks to hostesses and other social contacts. Most flowers bought by the public are grown in commercial greenhouses and then sold through wholesalers to retail florists. See also articles on individual flowers, *e.g.*, carnation; petunia; rose; tulip.

Flower, Sir William Henry (b. Nov. 30, 1831, Stratford upon Avon, Warwickshire, Eng.—d. July 1, 1899, London), British zo-

Flower, 1883
BBC Hulton Picture Library

ologist who made valuable contributions to structural anthropology and the comparative anatomy of mammals.

Flower became a member of the surgical staff at Middlesex Hospital, London, after serving as an assistant surgeon in the Crimean War. He was subsequently appointed curator of the Hunterian Museum of the Royal College of Surgeons (1861) and Hunterian professor of comparative anatomy and physiology (1870). In 1884 he succeeded Sir Richard Owen as director of the British Museum of Natural History, where he revolutionized the art of museum display. Foremost among Flower's many thorough mammalian studies are those dealing with marsupials, whales, and primates. He was the first to show that lemurs are primates and, in the course of extensive anthropological research, made complete and accurate measurements of at least 1,300 human skulls. He was knighted in 1892.

His chief publications are *Diagrams of the Nerves of the Human Body* (1861), *An Introduction to the Osteology of the Mammalia* (1870), *Introduction to the Study of Mammals, Living and Extinct* (1891), and *Essays on Museums and Other Subjects* (1898).

flower bug, also called MINUTE PIRATE BUG, or ANTHOCORID BUG, any member of the insect family Anthocoridae (order Heteroptera), which numbers about 400 species. The flower bug is important because it feeds on aphids and aphid eggs, although several species suck human blood (*e.g.*, the cosmopolitan *Lectocoris campestris* and the Sudanese *Anthocoris kingi*).

These small insects (2 to 5 mm, or 0.08 to 0.2 inch) are black with white markings; they are

Flower bug (*Orius tristicolor*)

William E. Ferguson

usually found on flowers, under loose bark, or in leaf litter. Their eggs are deposited in plant tissue, and the adults pass the winter in trash piles. Flower bugs differ from most heteropterans because they have a well-defined embolium (a section of the wing). The insidious flower bug, *Orius (Triphleps) insidiosus*, is a common North American species that preys on the grape phylloxera and the chinch bug.

flower chafer, any member of the beetle subfamily Cetoniinae (family Scarabaeidae, order Coleoptera). These insects, distributed worldwide, are brilliantly coloured, with the majority of the iridescent species occurring in the tropics. Most measure less than 12 mm (0.5 inch), although a few well-known ones are longer. The pollen-feeding adults tend to be hairy and are good pollinators. *Euphoria inda* resembles a bumblebee and even buzzes while flying. The North American green June beetle (*Cotinus nitida*) is about 25 mm (1 inch) long, dull velvet green in colour, and edged in yellow and brown. It feeds on figs and other fruits, often causing great damage. Muscular pads on the back of the long white grubs are used instead of their legs for locomotion.

Probably the best-known member is the

African goliath beetle (*Goliathus giganteus*). This insect, white with bold black lines on its body and with brown wing covers (elytra), may be more than 10 cm (4 inches) long; its black, leathery wings are larger than those of a sparrow. Most flower beetles have only small protuberances on the tops of their heads and prothorax (region immediately behind

African goliath beetle (*Goliathus giganteus*)
Appel

the head), although some have long hornlike structures. The colour of *Heterorrhina dohrni* of Sumatra, one of the most beautiful insects, changes with shifts in light from black and gold-green to deep orange-red.

flower fly: see hover fly.

flowering currant (plant): see *Ribes*.

flowering plant: see angiosperm.

flowering quince, any shrub of the genus *Chaenomeles* within the rose family (Rosaceae). The three known species are native to eastern Asia but cultivated in other regions

Flowering quince (*Chaenomeles*)
Walter Chandoha

for the flowers that appear early in the spring. The leaves are alternate, and the pink or red flowers are solitary or in small clusters. The green, applelike fruit is used in preserves. *C. japonica* has provided several horticultural varieties.

flowerpecker, any of 47 species belonging to the songbird family Dicaeidae, order Passeriformes, that have a double-tubed and brush-tipped tongue and finely serrated bill. Flowerpeckers occur in southern Asia, western Pacific islands, and Australia. They flit about, twittering, in trees and shrubs where they find small fruits. The pouchlike, felted nest may have a porched side entrance. A species seen in gardens from India and southern China to Indonesia is the scarlet-backed flowerpecker

(*Dicaeum cruentatum*); 9 cm (3.5 inches) long, it is red, black, and white. The pygmy flowerpecker (*D. pygmeum*) of the Philippines is

Philippine flowerpecker (*Prionochilus plateni*)
Painting by H. Jon Janosik

only about 6 cm long. The largest flowerpeckers are only about 23 cm in total length.

flowstone, mineral deposit found in "solution" caves in limestone. Flowing films of water that move along floors or down positive-sloping walls build up layers of calcium carbonate (calcite), gypsum, or other cave minerals. These minerals are dissolved in the water and are deposited when the water loses its dissolved carbon dioxide and therefore its carrying ability. Flowstone is usually white or translucent but may be stained various colours by minerals dissolved in the water.

Floyd, John Buchanan (b. June 1, 1806, Montgomery county, Va., U.S.—d. Aug. 26, 1863, Abingdon, Va.), American politician

Floyd
By courtesy of the Library of Congress, Washington, DC

who served as governor of Virginia, secretary of war, and Confederate general.

As a member of the Virginia state legislature (1847–48; 1855) and as a states' rights Democratic governor (1849–52), Floyd opposed secession, but his growing belief in the Southern cause led him to resign in 1860 from the Cabinet post to which President James Buchanan had appointed him in 1857. At the same time, however, charges of financial irregularities in his office (never substantiated) prompted the president to request his resignation. With the outbreak of the Civil War (1861), he was appointed brigadier general by Confederate President Jefferson Davis. In 1862 he was in command of the Confederate forces at Fort Donelson in Tennessee but withdrew his brigade before the surrender, under circumstances never clarified. For this he was relieved of his command but was later made a major general of Virginia troops by the Virginia assembly.

Floyd, Pretty Boy, byname of CHARLES ARTHUR FLOYD (b. 1901, Akins, Okla., U.S.—d. Oct. 22, 1934, near East Liverpool, Ohio), American gunman whose run-ins with police and violent bank robberies made newspaper headlines.

Originally a farmer, Floyd was drawn into

crime by the poverty of the Dust Bowl. After imprisonment for a payroll robbery (1925–29), Floyd mixed with gangsters in Kansas City, Mo., and adopted the machine gun as his professional trademark. He teamed up with others to rob banks in Ohio (where he was captured in 1930, but subsequently escaped), Michigan, and Kentucky and then returned to Oklahoma and further bank robberies, often destroying mortgage papers and thus acquiring a Robin Hood image among the people. He was gunned down by FBI agents pursuing him in an Ohio field.

flu: see influenza.

Fludd, Robert, Fludd also spelled FLUDD, Latin ROBERTUS DE FLUCTIBUS (b. 1574, Bearsted, Kent, Eng.—d. Sept. 8, 1637, London), British physician, author, and mystical philosopher remembered for his occultist opposition to science.

Fludd, detail of an engraving from *Integrum Morborum Mysterium*, 1631

By courtesy of the Royal College of Physicians, London

The son of Sir Thomas Fludd, he studied at St. John's College, Oxford, before traveling in Europe for six years. On his return to Oxford he earned medical degrees (1605) and joined the College of Physicians (1609). He eventually became a prosperous London doctor.

Most of Fludd's writings represent the culmination of the occult, as distinct from the scientific, tendencies of the 17th century. Deriving his ideas from such diverse sources as the Old Testament, the Jewish Kabbala, alchemy, astrology, sympathetic magic, and chiromancy, Fludd was primarily interested in establishing parallelisms between man and the world, both of which he viewed as images of God. The experimental observations in Fludd's works are few, and their general tendency is opposed to the growing rationalism and scientific approach of his time. In his view, medicine's role is to understand the functioning and malfunctioning of the human body by clues provided, for example, by parallelisms between the mind of man and the light of the Sun. The special analogies revealed by astrology and numerology were used to provide other medical insights. In his time Fludd was criticized widely as a magician and for his occult beliefs.

Flüe, Saint Nicholas of: see Nicholas of Flüe, Saint.

flügelhorn, brass musical instrument, the valved bugle used in European military bands. It has three valves, a wider bore than the cornet, and is usually pitched in Bb, occasionally in C. It was invented in Austria in the 1830s.

In the mid-20th century the flügelhorn found favour in some jazz bands. "Flügelhorn" also sometimes refers to the soprano and soprano saxhorns.

fluid, any liquid or gas or generally any material that cannot sustain a tangential, or shearing, force when at rest and that undergoes a continuous change in shape when subjected to such a stress. This continuous and irrecoverable change of position of one part of the material relative to another part when under

shear stress constitutes flow, a characteristic property of fluids. In contrast, the shearing forces within a solid, held in a twisted or flexed position, are maintained; the solid undergoes no flow and can spring back to its original shape. Compressed fluids can spring back to their original shape, too, but while compression is maintained, the forces within the fluid and between the fluid and the container are not shear forces. The fluid exerts an outward pressure, called hydrostatic pressure, that is everywhere perpendicular to the surfaces of the container.

Various simplifications, or models, of fluids have been devised since the last quarter of the 18th century to analyze fluid flow. The simplest model, called a perfect, or ideal, fluid, is one that is unable to conduct heat or to offer drag on the walls of a tube or internal resistance to one portion flowing over another. Thus, a perfect fluid, even while flowing, cannot sustain a tangential force; that is, it lacks viscosity and is also referred to as an inviscid fluid. Some real fluids of low viscosity and heat conductivity approach this behaviour.

Fluids of which the viscosity, or internal friction, must be taken into account are called viscous fluids and are further distinguished as Newtonian fluids if the viscosity is constant for different rates of shear and does not change with time. The viscosity of non-Newtonian fluids either varies with the rate of shear or varies with time, even though the rate of shear is constant. Fluids in a class in this last category that become thinner and less viscous as they continue to be stirred are called thixotropic fluids.

*A list of the abbreviations used
in the MICROPAEDIA will be found
at the end of this volume*

fluid, in physiology, a water-based liquid that contains the ions and cells essential to body functions and transports the solutes and products of metabolism.

Water, the principal constituent of fluids in animals, including humans, is taken into the body orally in foods and liquids and, to a lesser extent, is produced by the oxidation of food during metabolism. The average adult human takes in between 2,100 and 3,400 ml (2.2 and 3.6 quarts) of water per day. Water is lost from the body principally through the urine, although sweat and the skin and respiratory tract are also major routes of water loss. Under normal conditions, the average intake and output of water is about equal; under extreme physical stresses, however, such as prolonged exercise, daily water loss may be increased up to three-fold.

The fluids of the body may be classified into two main divisions: the fluid within cells (intracellular fluid) and the fluid outside the cell (extracellular fluid). The extracellular fluid can be further divided into interstitial fluid, plasma, lymph, cerebrospinal fluid, and milk (in mammals).

Extracellular fluids bathe the cells and conduct nutrients, cells, and waste products throughout the tissues of the body. Mature red blood cells, white blood cells, and platelets lie in a nearly colourless, protein-rich liquid called plasma. This substance is diffused through the capillary walls to the tissues of the body, carrying with it nutrients, oxygen, and regulatory molecules and drugs; some plasma diffuses back into the blood capillaries, bringing with it wastes, carbon dioxide, and metabolites. Interstitial fluid (so called because it is found in the interstices between cells) is almost identical to plasma but is very low in protein concentration. Interstitial fluid that enters the lymphatic system through lymph capillaries in the interstitial spaces is called lymph. This substance is filtered through lymph nodes rich in white blood cells and then returned to the

blood circulatory system through large lymph ducts. Lymph maintains the fluid level in the body, fights infection, and, by filtering through the gastrointestinal tract, absorbs and transports fats.

Cerebrospinal fluid, as its name suggests, surrounds and bathes the cavities of the brain and spinal cord. It also maintains intracranial pressures and acts as a lubricant and a mechanical barrier against shock. This fluid flows slowly from the ventricles of the brain, the principal site of its formation, down through the canals of the brain stem, and ultimately out into the tissue spaces surrounding the central nervous system. A clear, colourless liquid, cerebrospinal fluid is slightly alkaline, having a pH of 7.3–7.4. It is about 99 percent water and contains a small number of leukocytes and no red blood cells. In addition to the functions mentioned above, it circulates drugs and removes pathogens, chemicals, and waste products from the tissues of the brain and spinal cord and carries them into the bloodstream.

Milk is secreted by the milk-producing glands located in the breasts of female mammals. The large fat droplets secreted by these glands into the fluid of the breast produces the familiar white emulsion.

The principal cations (sodium, potassium, calcium, and magnesium), anions (chloride, bicarbonate, organic acids, phosphate, and proteins), and solutes (*e.g.*, proteins and glucose) of the body are not dispersed evenly throughout bodily fluids. Intracellular fluid contains relatively large quantities of potassium, phosphate, and proteins, and extracellular fluid contains relatively large quantities of sodium and chloride ions and smaller concentrations of proteins than found in intracellular fluids. These solute and ion gradients contribute to maintaining the equilibrium of the fluid and the electrical potential of the membranes. The system that regulates the intake and output of fluid and the individual's perception of fluid regulation involves the heart, kidneys, vagus nerve, hypothalamus, and pituitary gland. The hormones associated with this system are vasopressin or antidiuretic hormone (ADH), adrenocorticotrophic hormone, and aldosterone, which act in the kidneys to effect the increased retention of salt and water.

Various conditions can cause an excess or depletion of water or salts or an unhealthy hydrogen ion concentration in the body. Sodium depletion can instigate low blood pressure, reduced urine volume, and inhibition of the excretory system leading to kidney failure. Mild cases may be treated by having the affected person drink salt water. In severe cases salt water is injected into a vein.

Acute or chronic diarrhea, vomiting, intestinal fistulae, or various urinary abnormalities bring about potassium deficiencies. Symptoms are apathy, confusion, and weakness; severe cases may produce paralysis, changes in heart-beat, and even death. Potassium must be given either orally or intravenously.

Potassium intoxication, which may follow upon kidney failure, causes reduction in the volume of urine excreted, producing symptoms much like those of potassium depletion. Treatment is by elimination of potassium-rich foods (especially fruits) and protein from the diet.

Edema is the abnormal retention of body fluids in body tissues. Low blood volume initiates a flow of fluid out of the blood vessels into the surrounding tissue, and the system that regulates the volume of water in the body responds by a series of hormonal changes that swell the volume of water in the tissues even more. Alkalosis is a condition of excess alkalinity of the blood resulting from a loss of hydrogen ions. Acidosis is a condition of excess acidity of the blood, resulting from an overabundance of hydrogen ions.

fluid mechanics, the study of the effects of forces and energy on liquids and gases. Like other branches of classical mechanics, the subject subdivides into statics (often called hydrostatics) and dynamics (fluid dynamics, hydrodynamics, or aerodynamics). Hydrostatics is a comparatively elementary subject with a few classical results of importance but little scope for further development. Fluid dynamics, in contrast, is a highly developed branch of science that has been the subject of continuous and expanding research activity since about 1840.

A brief treatment of fluid mechanics follows. For full treatment, see *MACROPAEDIA: Mechanics: Energy, Forces, and Their Effects*.

The development of fluid dynamics has been strongly influenced by its numerous applications. Some of the fields of application to engineering, the environmental sciences, and the biological sciences are evident: aeronautical engineering, marine engineering, meteorology, oceanography, and the study of blood flow, the dynamics of swimming, and the flight of creatures. There are also many less immediately obvious applications.

Fluid dynamics is studied both theoretically and experimentally, and the results are described both mathematically and physically. The phenomena of fluid motion are governed by known laws of physics—conservation of mass, the laws of classical mechanics (Newton's laws of motion), and the laws of thermodynamics. These can be formulated as a set of nonlinear partial differential equations, and in principle one might hope to infer all the phenomena from these. In practice, this has not been possible; the mathematical theory is often difficult, and sometimes the equations have more than one solution, so that subtle considerations arise in deciding which one will actually apply. As a result, observations of fluid motion both in the laboratory and in nature are also essential for understanding the motion of fluids.

Liquids and gases are classified together as fluids because, over a wide range of situations, they have identical equations of motion and thus exhibit the same flow phenomena. Scaling analysis makes it possible to infer when two geometrically similar situations—of perhaps quite different size and involving different fluids (either both liquids, both gases, or one of each)—will give rise to the same type of flow. It leads to the formulation of various nondimensional parameters, with names like Reynolds number, Mach number, Froude number, in terms of which fluid-dynamical results are usually presented.

Flow configurations equally applicable to liquids and gases include flow through pipes, flow due to relative motion between a body and ambient fluid, and thermal convection—gravitationally driven flow due to temperature differences. Sometimes the effect of rotation of the whole system (of particular significance in meteorology and oceanography) is included. A common feature of all these flows is their tendency to undergo a spontaneous transition from one type of motion to another. The best-known type of transition is that from laminar flow (a smooth, regular type of flow) to turbulent flow (in which rapid, irregular fluctuations arise). Instability can also lead to a complicated flow with a highly regular structure (such as an orderly array of vortices or of convection cells). Much current research is concerned with gaining an understanding of these various transitions and, in particular, of how a deterministic set of equations can account for the chaotic behaviour of turbulent fluids.

During flow at speeds comparable to the speed of sound, the density of fluids changes significantly. This phenomenon is of practical

importance only for gases, in which shock waves may occur. These waves involve an almost discontinuous change in the velocity, temperature, pressure, and density of the fluid.

The main phenomena of importance for liquids but not for gases are those associated with free surfaces, such as the upper boundary of a liquid in a partly filled vessel. The fact that the speed of water waves varies with wavelength and with amplitude leads to a wide variety of effects. These include the hydraulic jump (or bore)—a sudden change in water level, analogous to a shock wave—and the soliton—a single large-amplitude pulse that propagates without change of form.

fluid power: see hydraulic power.

fluidics, the technology of using the flow characteristics of liquid or gas to operate a control system (*q.v.*). One of the newest of the control technologies, fluidics has in recent years come to compete with mechanical and electrical systems.

Although fluidic principles are fairly old, it was not until about 1960 that researchers attempted to use fluidics commercially. The demand for reliable controls in space research stimulated progress. In the 1930s Henri Coandă, a Romanian scientist, described what is now known as the Coandă effect, a major contribution to fluidic technology. He observed that as a free jet emerges from a jet nozzle the steam will tend to follow a nearby curved or inclined surface. It also "attaches" itself to and flows along this surface if the curvature or angle of inclination is not too sharp. Coandă explained this tendency as being caused by the jet stream's entraining (picking up) nearby fluid molecules. When the supply of these molecules is limited by an adjacent surface, a partial vacuum develops between the jet and the surface. If the pressure on the other side of the jet remains constant, the partial vacuum, which is a lower pressure region, will force the jet to bend and attach itself to the wall.

Because fluidics is not as rapid as electronics, it is unlikely to compete in fields with ultrahigh-speed requirements. On the other hand, in many applications fluidics is advantageous. It is now possible to detect, interlock, and power complex operations by using air throughout a system. Controls can be installed by a competent fitter who might not be capable of dealing with electronic or electrical systems. The elimination of electrical contacts prevents a possible fire hazard.

Pneumatic circuits require controls with simple interlocking, performed by air-piloted and mechanically operated control valves. Because it employs the same medium, fluidics is useful for sensitive detection and complex control as part of a pneumatic system.

Combining hydraulics and fluidics is more complicated, however, because the same medium is not used. Yet since both systems require plumbing expertise, labour problems can be reduced. Power-output devices handling hydraulic pressures that respond to fluidic signals are available commercially.

Fluidics has been applied to industrial problems on a wide scale, with no particular industry emerging as an obvious choice. Fluidics can operate in hazardous environments and sense objects by methods not available previously. Some typical applications include a weighing system that selects 10 different weights of raw material before machining; air-jet detection of delicate material (the roof lining of an automobile) that would be damaged by mechanical methods; and sonic detectors operating in the highly inflammable, contaminated area of a paint-spray booth. These detectors sense sound waves without disturbing the freshly painted surface.

Principles of operation. Fluidic devices op-

erate on either the digital principle (they are either "on" or "off") or the analogue principle (the output of the device is continuously proportional to the input). The accompanying Figure illustrates the distinction.

Basic fluidic circuits

In the case of an OR circuit, as shown in the Figure, input *a* or *b* can produce an output signal, because each has a path through which the signal can flow to the output. This system is called logical (and digital) because no output is possible without an input. Either condition will satisfy the required output (the OR function, as an output, is produced whenever one or the other input is energized).

When an AND circuit is involved, both inputs are required for an output because the flow from *a* or *b* alone, without a counterbalancing force, will go out one of the vents. If both are applied, they will collide, producing flow out of the centre port marked *a* and *b*. This again is logical (and digital) because no output is possible unless both signals are applied. All conditions must be satisfied before an output is obtained (the AND function) as an output signal will be produced only if an input is applied to both inputs *a* and *b* simultaneously.

With a proportional circuit, fluid flowing from the supply will go out of the vent unless input *a* is applied. This is an analogue effect because the output can be altered proportionally from minimum to maximum by varying the power of input *a*.

Fluidic devices can thus produce both logic (digital) and analogue (proportional) effects or functions. The OR and the AND are the most common logic functions.

In most fluidic devices, low-value input pressures or flows can control higher output pressures or flows. This is what is meant by the term fluid amplifier. A supply of fluid entering a device becomes a stream forced to follow a chosen path through carefully designed internal shapes before giving an output. Input jets of far lower power are positioned to give the greatest possible effect on the stream, thereby controlling the output. Fluid amplifiers respond to very small fluid signals provided by such devices as temperature or velocity detectors, generally by input sensors attached to existing mechanical movements. The number of devices controlled by one similar device is called the fan-out ratio. For example, if the output of one device is so strong that it can switch four others at the same time, the fan-out ratio is four.

Technological developments. Among the more recent advances in fluidics is modular construction of circuits—*i.e.*, construction of combinations of components that can be read-

ily fitted together to form whole systems. A motor governor system, for example, converts pulsating frequencies of air motor exhausts into pressure levels, which are then compared to preset values. The difference in pressure is amplified to provide speed regulation of the motor. Converting the frequency of ON/OFF pulses into progressively increasing or decreasing values is called digital proportional. Fluidic devices are stacked in layers to provide a common supply and interconnections.

Another significant development is the edge tone amplifier, which works very much like a musical instrument; air blown at a sharp wedge oscillates at very high frequencies (about 5,000 hertz) to produce an output that is virtually continuous. Frequency of oscillation (sound) is controlled mechanically or by varying the force of the air directed at the wedge.

Sound detection is possible with laminar streams that can be made sensitive to certain sound frequencies. A beam of sound can span distances for detection without even the slight force exerted by an air jet.

fluke, also called TREMATODE, any member of the invertebrate class Trematoda (phylum Platyhelminthes), a group of parasitic flatworms including nearly 6,000 species. Flukes occur worldwide and range in size from about 5 millimetres (0.2 inch) to several centimetres; most do not exceed 100 millimetres (4 inches) in length.

Liver fluke (*Fasciola hepatica*)
Grant Heilman—EB Inc

Flukes are parasites of all classes of vertebrates but most commonly parasitize fish, frogs, and turtles; they also parasitize humans, domestic animals, and invertebrates such as mollusks and crustaceans. Some are external parasites (ectoparasites); some attach themselves to internal organs (endoparasites); others are semi-external, attaching themselves to the lining of the mouth, to the gills, or to the cloaca (the end of the digestive tract). Some attack a single host, while others require two or more hosts.

The symmetrical body of a fluke is covered with a noncellular cuticle. Most are flattened and leaflike or ribbonlike, although some are stout and circular in cross section. Muscular suckers on the ventral (bottom) surface, hooks, and spines are used for attachment. The body is solid and filled with a spongy connective tissue (mesenchyme) that surrounds all the body organs. A circulatory system is absent. The digestive system consists of a simple sac with a mouth either at the anterior end or in the middle of the ventral surface. An anus is usually absent, but some species have one or two anal pores. The nervous system consists of a pair of anterior ganglia, or nerve centres, and usually three pairs of lengthwise nerve cords.

Most species are hermaphroditic; *i.e.*, functional reproductive organs of both sexes occur in the same individual. In some, however, the sexes are separate. Most species pass through egg, larval, and mature stages.

Blood flukes occur in most types of vertebrates; three species attack humans: the urinary blood fluke (*Schistosoma haematobium*), the intestinal blood fluke (*S. mansoni*), and

the Oriental blood fluke (*S. japonicum*). The human diseases caused by them are known as schistosomiasis (bilharziasis); they affect millions of persons, particularly in Africa and east Asia.

The urinary blood fluke (*S. haematobium*), which lives in the veins of the urinary bladder, occurs mainly in Africa, southern Europe, and the Middle East. Eggs, laid in the veins, break through the vein wall into the bladder and are voided during urination. The larval fluke develops in the body of a snail (chiefly of the genera *Bulinus* and *Physopsis*), the intermediate host. The mature larva makes its way into the body of the final host, man, through the skin or the mouth.

The intestinal blood fluke (*S. mansoni*), which lives in the veins around the large and small intestines, occurs primarily in Africa and in northern South America. The eggs pass from the host with the feces. The larva enters the body of a snail (any of several genera), the intermediate host, and returns to a human host through the skin.

The Oriental blood fluke, which occurs primarily in China, Japan, Taiwan, the East Indies, and the Philippine Islands, differs from *S. mansoni* and *S. haematobium* in that it may attack vertebrates other than man, including various domestic animals, rats, and mice. Snails of the genus *Oncomelania* are the intermediate host. The adult occurs in the veins of the small intestine. Some eggs are carried in the bloodstream to various organs and may cause a variety of symptoms, including enlargement of the liver. Human hosts may die from severe infestations.

Flukes of detrimental economic significance to man include the widely occurring giant liver fluke of cattle (*Fasciola hepatica*) and the Chinese, or Oriental, liver fluke (*Opisthorchis sinensis*, or *Clonorchis sinensis*). *F. hepatica* causes the highly destructive "liver rot" in sheep and other domestic animals. Man may become infested with this fluke by eating uncooked vegetables.

The Chinese liver fluke infests a variety of mammals, including man. In addition to the snail as an intermediate host, the Chinese liver fluke infests fish as a second intermediate host before passing to the final host. The cat liver fluke, *Opisthorchis felineus*, which may also infest man as the final host, also requires a freshwater snail (*Bithynia leachii*) and a carp as its secondary intermediate hosts.

Flumendosa River, Italian **FLUME FLUMENDOSA**, river that rises in the Gennargentu Mountains in southeastern Sardinia, Italy, and flows 79 miles (127 km) west and southeast, entering the Tyrrhenian Sea near Muravera. The Ente Autonomo del Flumendosa, a dam and irrigation project, was established in 1946 to develop the resources of the Flumendosa River basin.

fluorapatite, common phosphate mineral, a calcium fluoride phosphate, $\text{Ca}_5(\text{PO}_4)_3\text{F}$. It occurs as minute, often green, glassy crystals in many igneous rocks, and also in magnetite deposits, high-temperature hydrothermal veins, and metamorphic rocks; it also occurs as colophane in marine deposits. For detailed physical properties, see phosphate mineral (table).

The fluoride ion is often replaced in the crystal structure by chloride or a hydroxide group; in nature there are complete chemical variations, called solid-solution series, between fluorapatite and chlorapatite and between fluorapatite and hydroxylapatite. Manganese can replace up to 10 percent of the calcium in fluorapatite derived from granite pegmatites.

fluorescein, also called **RESORCINOLPHTHALEIN**, organic compound of molecular formula $\text{C}_{20}\text{H}_{12}\text{O}_5$ that has wide use as a synthetic coloring agent. It is prepared by heating phthalic anhydride and resorcinol over a zinc catalyst, and it crystallizes as a deep red pow-

der with a melting point in the range of 314° to 316° C (597° to 601° F). Fluorescein was named for the intense green fluorescence it imparts to alkaline solutions—a colour visible even at dilutions of 1:50,000,000. It is used as a dye to colour liquids in analytic instruments, in cosmetics, and as a water tracer or marker. Halogenated derivatives made from fluorescein also include eosin and erythrosin.

fluorescence photography, process that records the glow or visible light given off by certain substances when they are irradiated by ultraviolet rays. The exclusively ultraviolet irradiation is accomplished by means of a filter at the light source; another filter, placed over the camera lens, absorbs the reflected ultraviolet rays, permitting only the visible light (fluorescence) from the object itself to be recorded on the film. Normal lenses and either black-and-white or colour film are used.

Fluorescence photography can identify dyes, stains, and markings, specific chemical substances, and fluorescent components in microscope specimens.

fluorescent lamp, electric discharge lamp, cooler and more efficient than incandescent lamps, that produces light by the fluorescence of a phosphor coating. A fluorescent lamp consists of a glass tube filled with a mixture of argon and mercury vapour. Metal electrodes at each end are coated with an alkaline-earth oxide that gives off electrons easily. When current flows through the ionized gas between the electrodes, it emits ultraviolet radiation. The inside of the tube is coated with phosphors, substances that absorb ultraviolet radiation and fluoresce (reradiate the energy as visible light). Two common phosphors are zinc silicate and magnesium tungstate. A starter and ballast provide the extra voltage, up to four times of the operating voltage, needed to ionize the gas when starting.

fluorescent screen (image-forming device): see fluoroscope.

fluorine (F), most reactive chemical element, lightest member of the halogen elements, or Group VIIa of the periodic table.

A brief treatment of fluorine follows. For full treatment, see **MACROPAEDIA: Chemical Elements: Halogen elements**.

Under ordinary conditions fluorine is a gas a little heavier than air, with a pale yellow colour; inhalation except in very low concentrations is dangerous. Upon cooling, fluorine becomes a yellow liquid. Fluorine occurs combined in the widely distributed mineral fluorite (calcium fluoride, fluorspar), its chief source, in the minerals cryolite and fluorapatite, and in small amounts in seawater, bones, and teeth. Not a rare element, it makes up about 0.065 percent of the Earth's crust. Only one isotope occurs in nature, stable fluorine-19.

Fluorine is difficult to isolate from its compounds, and in fact it is impossible to free it by chemical means. No other element is powerful enough, as an oxidizing agent, to replace it. The French chemist Henri Moissan first isolated fluorine in 1886 by electrolysis of anhydrous hydrogen fluoride (HF), in which potassium hydrogen fluoride (KHF_2) had been dissolved to make it conduct a current. Elemental fluorine of high purity is prepared commercially by Moissan's procedure. The elemental gas is used as an oxidizer in rocket fuels and to prepare fluorides.

Fluorine, composed of two-atom molecules (F_2), combines with all other elements except helium, neon, and argon to form ionic or covalent fluorides. Its chemical activity can be attributed to its extreme ability to attract electrons (it is the most electronegative element) and to the small size of its atoms. The oxidation state of -1 is the only one observed in fluorine compounds. Because of the small size of the fluoride ion (F^-), it forms many stable complexes with positive ions; for exam-

ple, hexafluorosilicate(IV) (SiF_6^{2-}) and hexafluoroaluminate(III) (AlF_6^{3-}).

One of the principal industrial compounds of fluorine is hydrogen fluoride, obtained by treating fluorite with sulfuric acid. It is employed in the preparation of numerous inorganic and organic fluorine compounds of commercial importance, e.g., sodium aluminum fluoride (Na_3AlF_6), used as an electrolyte in the electrolytic smelting of aluminum metal; and uranium hexafluoride (UF_6), utilized in the gaseous diffusion process of separating uranium-235 from uranium-238 for reactor fuel. A solution of hydrogen fluoride gas in water is called hydrofluoric acid, large quantities of which are consumed in industry for cleaning metals and for polishing, frosting, and etching glass.

Boron trifluoride (BF_3) and antimony trifluoride (SbF_3), like hydrogen fluoride, are important catalysts for organic reactions; cobalt trifluoride (CoF_3) and chlorine trifluoride (ClF_3) are useful fluorinating agents; and sulfur hexafluoride (SF_6) is used as a gaseous electrical insulator. Sodium fluoride (NaF) is used to treat dental caries and is often added in small amounts to fluoride-deficient water supplies (fluoridation) to reduce tooth decay.

Elemental fluorine, often diluted with nitrogen, reacts with hydrocarbons to form corresponding fluorocarbons in which some or all hydrogen has been replaced by fluorine. The resulting compounds are usually characterized by great stability, chemical inertness, high electrical resistance, and other valuable physical and chemical properties. This fluorination may be accomplished also by treating organic compounds with cobaltic fluoride or by electrolyzing their solutions in anhydrous hydrogen fluoride. Useful plastics with non-sticking qualities, such as polytetrafluoroethylene ($[\text{CF}_2\text{CF}_2]_n$; known by the commercial name Teflon), are readily made from unsaturated fluorocarbons. Organic compounds containing chlorine, bromine, or iodine are fluorinated to produce compounds such as dichlorodifluoromethane (Cl_2CF_2), the coolant used in most household refrigerators and air conditioners.

atomic number	9
atomic weight	18.9984
melting point	-219.62° C (-363.32° F)
boiling point	-188° C (-306° F)
density (1 atm, 0° C)	1.696 g/litre
oxidation states	-1
electronic config.	2-7 or $1s^2 2s^2 2p^5$

fluorine deficiency, condition in which an organism fails to receive an adequate supply of fluorine, a water-soluble element stored in teeth and bones which strengthens them by aiding in the retention of calcium. Massive doses of fluorine or fluoride compounds can be lethal, and fluorides are used as the toxic ingredient of many insect poisons. Scientists feel they have proved conclusively, however, that dental caries is reduced in areas where natural fluoridation of water is moderate. This mineral has been added to water supplies, although such actions have in some cases provoked controversy. Studies have determined that the enamel of sound teeth contains more fluoride than is found in the teeth of persons prone to dental caries. Excess amounts of fluorine may cause tooth mottling, which presents no problem other than appearance.

Fluorine is also known to decrease the incidence of rickets in infants and children. It accentuates the effect of thyroid secretion in maintaining a normal basal metabolic rate. It has been determined that fluorides in minute amounts limit the acid production of bacteria in the mouth.

fluorite, also called **FLUORSPAR**, common halide mineral, calcium fluoride (CaF_2); the

principal fluorine mineral. It is usually quite pure, but as much as 20 percent yttrium or cerium may replace calcium. Fluorite occurs

Fluorite from Durham, Eng.
By courtesy of the Field Museum of Natural History, Chicago; photograph, John H. Gerard—EB Inc.

most commonly as a glassy, many-hued vein mineral and is often associated with lead and silver ores; it also occurs in cavities, in sedimentary rocks, in pegmatites, and in hot-springs areas. It is widespread in Germany, France, England, Mexico, and the central United States. Fluorite is used as a flux in the manufacture of open-hearth steel, of aluminum fluoride, of artificial cryolite, and of aluminum. It is used in opalescent glass, in iron and steel enamelware, in the production of hydrofluoric acid, in the refining of lead and antimony, and in the manufacture of high-octane fuels (as a catalyst). Because of its low index of refraction and low dispersion, clear, colourless fluorite of optical quality is used for apochromatic lenses. At one time blue john, a variety from Derbyshire, Eng., was widely used in ornamental vases and other objects. For detailed physical properties, see halide mineral (table).

fluorocarbon, compound composed of the elements carbon and fluorine; see halocarbon.

fluoroethylene: see vinyl fluoride.

fluoroscope, also called FLUORESCENT SCREEN, instrument consisting of a surface containing phosphors that glow when impinged on by X-rays or gamma rays; it is used to transform images made up of invisible radiations into visible light. In diagnostic radiology (fluoroscopy), a beam of penetrating radiation is passed through parts of the body; transmitted radiation forms an image of the internal organs in motion on the screen for viewing. Fluoroscopes are also used for the examination of, and search for flaws in, raw materials, manufactured articles, and welded joints.

fluorosis, chronic intoxication with fluorine (usually combined with some other element to form a fluoride) that results in changes in the skeleton and ossification of tendons and ligaments. Exposure to fluoride in optimum amounts (about one part per million of fluoride to water) is claimed to be beneficial to the teeth (in the prevention of caries) and probably to bone development; fluorides ingested in very high amounts over a short period are general poisons that produce quick death. Mild chronic exposure (6–8 parts per million of water) will cause mottling of tooth enamel in children, but the bones are unaffected. In more severe chronic exposure, bone calcium is

gradually replaced by fluorine; the bones become soft and crumbly and turn chalky white. Protrusions of new bone develop in abnormal places. There are few early symptoms, but late developments include stiffness, inability to move the spine, and neurologic symptoms when nerves of the spinal cord are compressed.

Chronic exposure occurs from air pollution in certain areas, among workers in the insecticide, aluminum-mining, and phosphate-fertilizer industries, and in whole groups of people who live in areas with waters naturally high in fluorides. The latter form of exposure is not a significant cause of fluorosis in the Western Hemisphere, but in parts of India and Arabia bone affections are endemic.

Fluothane (medicine): see halothane.

Flushing (The Netherlands): see Vlissingen.

Flushing, northern section of the borough of Queens, New York, U.S., at the head of Flushing Bay (East River). Settled in 1645 by English Nonconformists (who had probably been living at Vlissingen [Flushing], Holland), it became a Quaker centre under the leadership of John Bowne. The Flushing Remonstrance (1657) protested the persecution of Quakers and the trial of Bowne. In the late 18th and early 19th centuries Flushing was noted for its commercial nurseries. It flourished as a township and then a village until it was absorbed by Queens in 1898. Flushing Meadows-Corona Park was the site of the 1939–40 and 1964–65 New York world's fairs (the Hall of Science remains as an exhibition centre), and in 1946–49 it served as the temporary headquarters for the United Nations General Assembly. In 1978 the park became the site of the U.S. Tennis Association's National Tennis Center. Shea Stadium, home of the New York Mets baseball team, is also in Flushing Meadows.

flute, French FLÛTE, German FLÖTE, wind instrument in which the sound is produced by a stream of air directed against a sharp edge, upon which the air breaks up into eddies that alternate regularly above and below the edge, setting into vibration the air enclosed in the flute. In vertical, end-vibrated flutes—such as the Balkan *kaval*, the Arabic *nāy*, and panpipes—the player holds the pipe end to his

Indonesian duct flute, bamboo; in the Horniman Museum, London

By courtesy of the Horniman Museum, London; photograph, J.R. Freeman & Co. Ltd

mouth, directing his breath against the opposite edge. In China, South America, Africa, and elsewhere, a notch may be cut in the edge to facilitate sound generation (notched flutes). Vertical nose flutes are also found,

especially in Oceania. In transverse, or cross, flutes (*i.e.*, horizontally held and side blown), the stream of breath strikes the opposite rim of a lateral mouth hole. Vertical flutes such as the recorder, in which an internal flue or duct directs the air against a hole cut in the side of the instrument, are known as fipple, or whistle, flutes.

Flutes are typically tubular but may also be globular, as with the ocarina and primitive gourd flutes. If a tubular flute is stopped at the lower end, its pitch is an octave lower than that of a comparable open flute.

The characteristic flute of Western music is the transverse flute held sideways to the right of the player. It was known in ancient Greece and Etruria by the 2nd century BC and was next recorded in India, then China and Japan, where it remains a leading wind instrument. It is first depicted in Europe c. 1100 AD. In the 16th century the tenor flute, pitched in G, was played in consort with descant and bass flutes (pitched in D and C respectively). All were typically of boxwood with six finger holes and no keys, semitones being made by cross-fingering (uncovering the holes out of sequence), and retained the cylindrical bore of their Asiatic bamboo relatives. These 16th-century flutes were made obsolete late in the 17th century by the one-keyed conical flute, probably conceived by the celebrated Hotte-terre family of makers and players in Paris. A conical flute is made in separate joints, the head joint being cylindrical, the others contracting toward the foot. Two joints were common in the 18th century, the upper being supplied in alternate lengths for tuning purposes. The instrument was known then as the *flauto traverso*, *traversa*, or German flute, as distinct from the common flute, usually called the recorder.

From 1760, in order to improve various semitones, three chromatic keys in addition to the original Eb key began to be used. By 1800 the typical orchestral flute had these keys plus a lengthened foot joint to C, making six keys altogether. Two more keys produced the eight-keyed flute, which preceded the modern instrument and which lasted, with various auxiliary keys, in some German orchestras into the 20th century.

Theobald Böhm, a Munich flute player and inventor, set out to rationalize the instrument, creating his new conical model in 1832. He replaced the traditional hole layout with an acoustically based one and improved the venting by replacing closed chromatic keys with open-standing keys, devising for their manipulation a system of ring keys on longitudinal axles (rings allow a player to close an out-of-reach key in the same motion as covering a finger hole).

This flute was superseded in 1847 by Böhm's second design, with its experimentally evolved cylindrical bore (having a contracting or parabolic head)—the flute since used. The loss of a certain depth and intimacy of tone of the old conical flute has been offset by gains in evenness of notes, complete expressive control throughout the compass at all dynamic levels, and almost limitless technical flexibility.

A modern Böhm-system flute (pitched in C with the range c'–c) is made of wood (cocuswood or blackwood) or metal (silver or a substitute). It is 26½ inches (67 centimetres) long, with a bore of about ¼ inch, built in three sections. The body, or middle joint, and the foot joint (sometimes made in one piece) have the note holes (13 at least), which are controlled by an interlocking mechanism of padded key plates hinged on a longitudinal axis. The bore narrows in the head joint, which contains the mouth hole, and is closed just above the hole by a cork or fibre stopper; it is open at the foot end. Other flute sizes include the piccolo, the alto flute (in England sometimes called the bass flute) in G, the bass

(or contrabass) flute an octave below the flute, and the various sizes used in military flute bands, generally pitched in Db and Ab.

flutemouth, either of two families of elongated, long-snouted, marine fishes: *Fistulariidae*, the cornetfish (*q.v.*), and *Aulostomidae*, the trumpet fish (*q.v.*).

fluting and reeding, also called **GADROONING**, in architectural decoration, surfaces worked into a regular series of (vertical) concave grooves or convex ridges, frequently used on columns. In Classical architecture fluting and reeding are used in the columns of all the orders—except the Tuscan. In the Doric order there are 20 grooves on a column and in the Ionic, Corinthian, and Composite orders there are 24.

Sometimes, although not in the Doric, the flutes are partly filled by a small, round, convex molding, or bead, and are then known as cabled; this decoration does not usually extend higher than one-third of the shaft. Sometimes channeling, slightly resembling fluting, is found on Norman pillars, an instance of which is found in the crypt of Canterbury Cathedral, Kent, Eng. Exactly the same kind

(Left) Fluting and (right) reeding

From M.S. Briggs, *Everyman's Concise Encyclopaedia of Architecture*, E.P. Dutton & Co. Inc. and J.M. Dent & Sons Ltd

of ornament occurs frequently in Germany—*e.g.*, in the crypt of Roda Rolduc, near Aachen, which, it has been suggested, might be copied from Canterbury, and in many 12th-century buildings in other parts of Europe. Sometimes the flutings are carried diagonally across the columns, as in the pillars of the cathedral at Durham, Eng.

flutter and wow, in sound reproduction, waver in a reproduced tone or group of tones that is caused by irregularities in turntable or tape drive speed during recording, duplication, or reproduction. Low-frequency irregularities (as one per revolution of a turntable, referred to as “once arounds”) cause wow and are recognized aurally as fluctuations in pitch. Irregularities that occur at higher frequencies are called flutter and cause a roughening of the tone: a piano sounds like a harp, and voices waver with small, rapid variations above and below proper pitch. Included among the causes of flutter and wow in disks are high spots in

drive rollers and an off-centre hole in the disk. In tape and film reproducers, characteristic causes include nonuniform tension in take-up and payoff reels and mechanical distortion of the tape. Low-frequency background noise, either recorded on disk or tape from the recording mechanism or added to the reproduced tone from the reproducing mechanism, is known as rumble and is usually the result of vibration of the drive mechanism.

fluvial process, the physical interaction of flowing water and the natural channels of rivers and streams. Such processes play an essential and conspicuous role in the denudation of land surfaces and the transport of rock detritus from higher to lower levels.

A brief treatment of fluvial processes follows. For full treatment, see **MACROPAEDIA: Geomorphic Processes**.

Over much of the world the erosion of landscape, including the reduction of mountains and the building of plains, is brought about by the flow of water. As the rain falls and collects in watercourses, the process of erosion not only degrades the land, but the products of erosion themselves become the tools with which the rivers carve the valleys in which they flow. Sediment materials eroded from one location are transported and deposited in another, only to be eroded and redeposited time and again before reaching the ocean. At successive locations, the riverine plain and the river channel itself are products of the interaction of a water channel's flow with the sediments brought down from the drainage basin above.

The velocity of a river's flow depends mainly upon the slope and the roughness of its channel. A steeper slope causes higher flow velocity, but a rougher channel decreases it. The slope of a river corresponds approximately to the fall of the country it traverses. Near the source, frequently in hilly regions, the slope is usually steep, but it gradually flattens out, with occasional irregularities, until, in traversing plains along the latter part of the river's course, it usually becomes quite mild. Accordingly, large streams usually begin as torrents with highly turbulent flow and end as gently flowing rivers.

In floodtime, rivers bring down large quantities of sediment, derived mainly from the disintegration of the surface layers of the hills and valley slopes by rain and from the erosion of the riverbed by flowing water. Glaciers, frost, and wind also contribute to the disintegration of the Earth's surface and to the supply of sediment to rivers. The power of a river current to transport materials depends to a large extent on its velocity, so that torrents with a rapid fall near the sources of rivers can carry down rocks, boulders, and large stones. These are gradually ground by attrition in their onward course into shingle, gravel, sand, and silt and are carried forward by the main river toward the sea or partially strewn over flat plains during floods. The size of the materials deposited in the bed of the river becomes

smaller as the reduction of velocity diminishes the transporting power of the current.

Since the earliest days of modern applied hydraulics, engineering research has attempted to better understand sediment transportation. Because sediment particles are generally heavier than the amount of water they displace, the Archimedes principle could not be used to explain the fact that heavy sediment was capable of being lifted and transported by flowing water. Another explanation was, consequently, required. Twentieth-century research distinguishes, in this connection, between “bed load” on the one hand and “suspended load” on the other. The former is composed of the larger particles, which are either rolled or pushed along the bed of the stream or which “jump,” or saltate, from the crest of one ripple to another if the velocity is sufficiently great. On the other hand, the smaller particles, the suspended sediment once picked up and lifted by the moving water, may remain in suspension for considerable periods of time and thus be transported over many kilometres.

flux, in metallurgy, any substance introduced in the smelting of ores to promote fluidity and to remove objectionable impurities in the form of slag. Limestone is commonly used for this purpose in smelting iron ores. Other materials used as fluxes are silica, dolomite, lime, borax, and fluorite. In soldering, a flux is used to remove oxide films, promote wetting, and prevent reoxidation of the surfaces during heating. Rosin is widely used as a non-corrosive flux in soldering electronic equipment; for other purposes, a water solution of zinc chloride and ammonium chloride may be used. See also slag.

fluxion, in mathematics, the original term for derivative (*q.v.*), introduced by Isaac Newton in 1665. Newton referred to a varying (flowing) quantity as a fluent and to its instantaneous rate of change as a fluxion. Newton stated that the fundamental problems of the infinitesimal calculus were: (1) given a fluent (that would now be called a function), to find its fluxion (now called a derivative); and, (2) given a fluxion (a function), to find a corresponding fluent (an indefinite integral). Thus, if $y = x^3$, the fluxion of the quantity y equals $3x^2$ times the fluxion of x ; in modern notation, $dy/dt = 3x^2(dx/dt)$. Newton's terminology and notations of fluxions were eventually discarded in favour of the derivatives and differentials that were developed by G.W. Leibniz. See also calculus.

fly, any of several thousand species of insects belonging to the order Diptera and characterized by the use of only one pair of wings for flight and the reduction of the second pair of wings to knobs (called halteres) used for balance. The term fly is commonly used for almost any small flying insect. In entomology, however, the name refers specifically to the approximately 85,000 species of dipterans, or “true” flies, which are distributed throughout the world, including the subarctic and high mountains.

Dipterans are known by such common names as gnats, midges, mosquitoes, and leaf miners, in addition to numerous sorts of flies, including the horsefly, housefly, and blowfly and fruit, bee, robber, and crane flies. Many other species of insects are called flies (*e.g.*, dragonflies, caddisflies, and mayflies), but their wing structures serve to distinguish them from true flies. Many species of dipterans are of great importance economically, and some, such as the common housefly and certain mosquitoes, are of importance as disease carriers. See dipteran.

fly-catcher plant, also called **AUSTRALIAN PITCHER PLANT** (*Cephalotus follicularis*),

only species in the flowering plant family Cephalotaceae, native to damp sandy or swampy terrain in southwestern Australia. It is a perennial herb with a deep taproot

Fly-catcher plant (*Cephalotus follicularis*)

W.H. Hodge

and a short, woody underground stem and buff-coloured flowers. The lower leaves are adapted to a pitcher shape which traps insects and secretes a liquid that digests them.

Fly River, one of the largest rivers of New Guinea, flowing almost wholly through Papua New Guinea. For a short stretch of its middle course, it forms the border between Papua New Guinea on the east and the Indonesian province of Irian Jaya on the west. Rising on the Star, Kaban, and Hindenburg ranges of the Victor Emanuel Range in the central highlands, the Fly, fed by its principal tributaries, the Strickland, Alice, and Palmer rivers, flows south and southeast for more than 700 mi (1,100 km) to the Gulf of Papua, Coral Sea. Traversing deep gorges through rain forests in its upper course, the river broadens and deepens its channel below the Palmer junction. From this junction to the sea (540 mi) the river is navigable in all seasons to boats drawing less than 8 ft (2½ m) of water. This lowest stretch, in which the stream falls only about 50 ft, is bordered by open savanna-like country and swampy plains with numerous lakes. The Fly may be in flood from October to April, moving large quantities of material downstream to be deposited as shifting sandbars and islands (Kiwai, Wabuda, Purutu) in its 40-mi-wide mouth. The material, together with that transported by the Digoel and other neighbouring streams, has built up an enormous plain bordering the Torres Strait. There are no settlements of any size along the river. Total indigenous population is scanty, and there are only a few coconut plantations in the area. Crocodiles are also hunted. The river was named by Captain F.P. Blackwood, of HMS "Fly," who explored the estuary in 1842.

Fly River turtle: see pitted shell turtle.

fly-tying, the hobby or business of imitating the live food of gamefish by attaching various materials to a hook. Most often used to imitate various life stages of insects, the craft also imitates minnows and other natural foods. It has been estimated that more than a quarter of a million persons pursue fly-tying as a hobby. The origins of fly-tying date to the 1st or 2nd century BC in Macedonia, where

brown-trout anglers attached feathers to their hooks to imitate the insect life in the streams. In England the art of fly-tying was systematized and recorded by Charles Cotton in Part 2 of later editions of Izaak Walton's *The Compleat Angler* in the second half of the 17th century. Thus began centuries of experimentation, dispute, and often bickering among competing schools of fly-tying. The literature of angling and fly-tying is immense with more than 5,000 volumes in English alone.

Most fly-tying is designed for trout and salmon fishing. There are three stages of insect life that fly-tiers attempt to imitate. Dry flies, representing the perfect or imago stage, are those that float on the surface. Constructed from materials that will aid flotation, these flies attempt to imitate insects that are either emerging from the stream or returning to it to lay eggs or to die after mating. These flies are carefully tied to exactly imitate a number of insects that are found in trout streams. An entire school of anglers, particularly in England, refuses to fish with anything but the dry fly. The second type of fly is the wet fly, designed to drift underwater and to be taken by the fish as either a nymph, a drowned mature fly, a minnow, or at any rate a morsel. The third is the nymph, which seeks to imitate the nymphal or larval stage of a fly's life. Nymphs are tied to represent larvae that have been dislodged from their mooring on the bottom or a rock, or that are rising to the surface to split their outer skin and emerge with wings. Nymphs are often tied over lead wire to cause them to sink. Trout flies are also tied as streamers to imitate minnows and other baitfish.

In salmon fishing, a variety of surface and subsurface flies are tied as attractors. Because the salmon does not feed upon entering the stream, the flies are designed to provoke a strike. Flies are also tied for bass fishing, pan-fishing, and ocean fishing. Among the most popular of saltwater fish taken on the fly is the bonefish.

The materials used in fly-tying include a wide variety of furs used for their various qualities and colours. Feathers of varied stiffness and colours are also mainstays of the fly-tier. Thread, tinsel, wool, and many other materials including synthetics are used by the fly-tier.

flycatcher, any of a number of perching birds (order Passeriformes) that dart out to capture insects on the wing, particularly members of the Old World songbird family Muscicapidae (*q.v.*) and of the New World family Tyrannidae, which consists of the tyrant flycatchers. Many taxonomists expand the family Muscicapidae to include the thrushes, warblers, and babblers, treating the Old World flycatchers in two or more subfamilies, Muscicapinae (typical flycatchers) and Monarchinae (monarch flycatchers) and, in some classification systems, Rhipidurinae (fantailed flycatchers).

Pied flycatcher (*Muscicapa hypoleuca*)

John Markham

The main muscicapine genus is *Muscicapa* (including *Ficedula*), and the commonest species, breeding in Europe and typical of the subfamily, is the spotted flycatcher (*M. striata*), a 14-centimetre (5½-inch) streaked grayish-brown bird of open woodlands and gardens eastward through Asia. It has a thin sibilant call and has the habit of flicking its wings. The pied flycatcher (*M. hypoleuca*) breeds in Europe, northern Africa, and western Asia; the male is black and white. Found in forests from India to the Philippines is Tickell's blue flycatcher (*M. tickelliae*); it is blue above and red below—much like an American bluebird. A Japanese example of brightly coloured muscicapines is the narcissus flycatcher (*M. narcissina*), in which the male is black, yellow, and white; unlike most of the subfamily, it is a good singer. Widespread in Africa is the 10-cm (4-in.) dusky flycatcher (*Alseonax adustus*).

Among familial relatives, for monarch and paradise flycatchers, see monarch; for puffback flycatchers, see wattle-eye; and for fan-tailed flycatchers, see fantail.

flying bomb: see V-1 missile.

flying doctor service, method for supplying medical service by airplane to areas where doctors are few and communications difficult. The plan for the first service of this type was conceived in 1912 by the Rev. John Flynn, superintendent of the Australian Inland Mission of the Presbyterian Church. Flynn's plan came to fruition in May 1928, when the first base of what is now the Royal Flying Doctor Service of Australia began operating at Cloncurry, Queensland, under Dr. K. St. Vincent Welch. An Adelaide electrical engineer, A.H. Traeger, developed a low-powered, portable, pedal-driven, Morse radio transmitter-receiver with a range of 300 miles. This transceiver, with the use of airplanes, made possible a system of regular long-distance medical consultations and the flying of doctors to patients in emergencies.

More than a dozen bases, run by state branches, came to cover two-thirds of the Australian continent and part of Tasmania. The Australian state governments contribute one-third of the finances; the rest is derived from voluntary and outpost subscriptions and message charges. The flying doctor service is free.

Other parts of the world regularly use aircraft for the assistance of the isolated sick. In Canada the Saskatchewan Air Ambulance Service was inaugurated in 1947. Newfoundland operates from the International Grenfell Association at St. Anthony an air ambulance service, likewise begun in 1947, covering northern Newfoundland and Labrador. The Royal Canadian Air Force operates a search and rescue service for Eskimos and Indians in the Arctic.

In East Africa the African Medical and Research Foundation, established in 1957 by joint British and American enterprise, was enabled in 1961 to begin a flying doctor service with a single airplane provided by private United States benefaction. In collaboration with this body, the Flying Doctor Service of Africa, Ltd., registered in the United Kingdom, planned a pilot scheme to be based at Gusau, northern Nigeria.

Flying Dutchman, in European maritime legend, spectre ship doomed to sail forever; its appearance to seamen is believed to signal imminent disaster. In the most common version, the captain, Vanderdecken, gambles his salvation on a rash pledge to round the Cape of Good Hope during a storm and so is condemned to that course for eternity; it is this rendering which forms the basis of the opera *Der fliegende Holländer* (1843) by the German composer Richard Wagner.

Another legend depicts a Captain Falkenberg

sailing forever through the North Sea, playing at dice for his soul with the devil. The dice-game motif recurs in the *Rime of the Ancient Mariner* (1798) by the English poet Samuel Taylor Coleridge; the mariner sights a phantom ship on which Death and Life in Death play dice to win him. The Scottish writer Sir Walter Scott adapted the legend in his narrative poem *Rokeby* (1813); murder is committed on shipboard, and plague breaks out among the crew, closing all ports to the ship.

flying fish, any of about 40 species of oceanic fishes of the family Exocoetidae (order Atheriniformes), found worldwide in warm waters and noted for their ability to fly. They are all small, attaining a maximum length of

California flying fish (*Cypselurus californicus*)
© Richard Herrmann

about 45 cm (18 inches), and have winglike, rigid fins and an unevenly forked tail. Some species, such as the widely distributed *Exocoetus volitans*, are two-winged, with only the pectoral fins enlarged; others, such as the California flying fish (*Cypselurus californicus*), are four-winged, with both the pectoral and pelvic (posterior) fins enlarged.

A flying fish does not fly, in the sense of flapping its wing-sized fins, but actually glides. The fish builds up speed underwater, swimming toward the surface with its fins folded tightly against its streamlined body. Upon breaking the surface, the fish spreads its enlarged fins and gains additional thrust from rapid beats of the still-submerged tail. When sufficient speed has been attained, the tail is lifted clear of the water and the fish is airborne, gliding a few feet above the surface at a speed of about 16 km/h (10 miles per hour). The fish can make several consecutive glides, the tail propelling it up again each time it sinks back to the surface. The stronger fliers can span as much as 180 m (600 feet) in a single glide, and compound glides, timed as long as 43 seconds, may cover 400 m (1,300 feet).

Flight for these fishes is primarily a means of escaping predators. Flying fish can attain enough height to carry them onto the decks of ships in their waters, where their remains are frequently discovered at dawn.

Flying Fortress (U.S. aircraft): see B-17.

flying fox, also called FOX BAT, any of numerous tropical Old World bats belonging to the family Pteropodidae (*q.v.*).

flying gurnard, any of a small group of marine fish comprising the family Dactylopteridae (or Cephalacanthidae) and the order Dactylopteriformes (sometimes placed in Scorpaeniformes). Flying gurnards are similar to the sea robins, or gurnards (family Triglidae, order Scorpaeniformes), and are sometimes considered as relatives of that group (see sea robin).

Found in warm and tropical seas, flying gurnards are elongated fish with very large pectoral fins, each of which is divided into a shorter forward portion and a much larger, winglike posterior section. These fins are quite colourful; those of the Atlantic *Dactylopterus*

Atlantic flying gurnard (*Dactylopterus volitans*)
Carl Roessler

volitans, for example, are brightly spotted with blue. Flying gurnards are further characterized by a covering of bony plates on their heads and by a single dorsal fin ray, separate from the rest of the fin and located on the nape of the neck. Flying gurnards grow to a maximum length of about 50 cm (20 inches). They are bottom dwellers but are reportedly able to glide above the water for short distances on their outspread pectoral fins.

flying lemur (mammal): see colugo.

flying phalanger (marsupial): see glider.

flying saucer: see unidentified flying object.

flying snake, any of three species of snakes constituting the genus *Chrysopelea* of the family Colubridae. These slender arboreal snakes, found in South Asia and the Indonesian archipelago, are able to glide short distances through the air by straightening the body and drawing up the ventral scales to make the underside concave.

They are active by day, capturing rodents, bats, birds, and lizards. *Chrysopelea ornata*

Flying snake (*Chrysopelea*)
Bucky Reeves—The National Audubon Society Collection/
Photo Researchers

of India and Sri Lanka (Ceylon), sometimes called golden tree snake, is up to 100 cm (40 inches) long and usually black or greenish, with yellow or reddish markings.

flying squirrel, any member of two distinct groups of rodents that are able to make gliding leaps by means of the parachute-like membranes connected on each side to their forelegs and hind legs. The North American and Eurasian flying squirrels form one group, the subfamily Petauristinae of the squirrel family, Sciuridae (order Rodentia). The scaly-tailed flying squirrels are African rodents of an entirely different family, Anomaluridae.

There are about 12 genera and 35 species of flying squirrels in the family Sciuridae. Slender,

long-limbed forest dwellers, these squirrels have soft fur and large eyes and are 8 to 60 cm (3 to 24 inches) in length, exclusive of the long, often flattened, tail. They live in trees, usually nest in tree holes, and feed on nuts, fruit, other plant material, and insects. They seldom descend to the ground. Unlike other squirrels, they are nocturnal.

New World flying squirrel (*Glaucomys*)
C.G. Hampson

The gliding membranes of these squirrels are furry flaps of skin and muscle. Rods of cartilage at the wrists serve to spread the membranes. In "flying," the squirrels leap spread-eagled and use their outstretched gliding membranes for gliding and their bushy tails for guidance. Glides of 60 m (almost 200 feet) or more from one tree to another have been recorded.

There are two species of gliding sciurids in North America and one that reaches eastern Europe; all others are Asian. The two North American species, known as New World flying squirrels (*Glaucomys*), are reddish or grayish brown and are 21 to 37 cm long, including the 8- to 18-centimetre tail. They are gregarious animals that nest at times in birdhouses or buildings. *Pteromys volans*, a species of Old World flying squirrel, is long-haired, silvery or grayish, and 10 to 20 cm long excluding the 10- to 15-centimetre tail; it occurs throughout the coniferous forests of Eurasia. Exclusively Asian flying squirrels include the large, brown or black, giant flying squirrels (*Petaurista*); the long-haired, gray-brown woolly flying squirrel (*Eupetaurus*, or *Hylopetes cinereus*); and the grayish to reddish brown or black Indo-Malaysian flying squirrels (*Hylopetes*).

Africa's scaly-tailed flying squirrels, or scaletails, are placed in 4 genera and about 12 species, all but one of which, the flightless scaletail (*Zenkerella insignis*), possess gliding membranes. The membranes differ from those of the sciurids in being attached to a cartilage rod at the elbow instead of the wrist. Rows of scales on the underside of their tufted tails aid these squirrels in climbing and in clinging to trees after a glide. Scaletails are similar to sciurids in appearance and are about 10 to 40 cm long without the tail. They live in tree hollows and feed on both plant material and insects. With the possible exception of the nongliding, flightless scaletail, they are nocturnal.

Flying Tigers, byname of AMERICAN VOLUNTEER GROUP, American civilian volunteer pilots recruited by Colonel Claire L. Chennault (*q.v.*) to fight the Japanese in Burma (Myanmar) and China during 1941–42, at a time when Japan's control over China's ports and transportation system had almost cut off China's Nationalist government from the outside world. Flying in battered planes and facing chronic shortages of fuel, parts, and pilots, this small company of air fighters nevertheless scored victory after victory over the far larger and better equipped Japanese air force.

They flew supplies, provided air cover for the Burma Road, succeeded in protecting the Chinese capital of Chungking, and fought the Japanese over southwestern and other parts of China. Surprise, mobility, precision flying, and unorthodox tactics enabled the Tigers to outwit the Japanese and inflict considerable damage on their air and ground forces. On July 4, 1942, members of the unit who wished were absorbed into the U.S. 10th Air Force and became the nucleus of the China Air Task Force (reorganized in March 1943 as the 14th Air Force), still under the command of Chennault, who was promoted to brigadier general.

Flynn, Errol, in full ERROL LESLIE THOMSON FLYNN (b. June 20, 1909, Hobart, Tas., Australia?—d. Oct. 14, 1959, Vancouver, B.C., Can.), motion-picture actor who, on stage and off, was known as a romantic adventurer. Given to making up stories about himself, he is known to have claimed either Antrim, Ire., or Tasmania as his birthplace.

The son of a biologist, Flynn did spend his youth in New Guinea prospecting for gold, sailing his own schooner, and sending off a regular column to the *Sydney Bulletin*. He went to Hollywood in 1935 where, as a last minute stand-in for Robert Donat, he achieved instant stardom in *Captain Blood*. There followed many swashbuckling roles to which he contributed his athletic grace and extraordinary good looks, including *The Charge of the Light Brigade* (1936), *The Adventures of Robin Hood* (1938), *They Died with Their Boots On* (1941), and *Gentleman Jim* (1942).

Flynn's tremendous popularity suffered when he was tried for statutory rape in 1942 (and acquitted). After a number of ill-chosen roles, his reputation as an actor was restored by *The Sun Also Rises* (1957), *The Roots of Heaven* (1958), and *Too Much Too Soon* (1958). He completed an autobiography, *My Wicked, Wicked Ways*, shortly before his death.

Flynn, John (b. Nov. 25, 1880, Moliagul, Vic., Australia—d. May 5, 1951, Sydney, N.S.W.), moderator of the Presbyterian Church in Australia (1939–42) and missionary to the country's wild central and northern inland, who in 1928 founded what later became the Royal Flying Doctor Service of Australia.

After serving as a staff member of the Presbyterian Home Mission in Victoria (1902–10), Flynn moved to South Australia and was ordained in 1911. In September 1912 he presented a report to the Presbyterian Church assembly on the hardships of life that he had observed in central and northern Australia. The church responded by establishing the Australian Inland Mission, which Flynn directed until his death. Before 1920 Flynn had conceived of a plan that would provide medical care by airplane to remote areas. He spent several years developing a communications network between rural outposts and a medical base established at Cloncurry, Queen.; the service began operations in 1928.

flysch, sequence of shales rhythmically interbedded with thin, hard, graywacke-like sandstones. The total thickness of such sequences is commonly many thousands of metres, but the individual beds are thin, only a few centimetres to a few metres thick. The presence of rare fossils indicates marine deposition. Flysch facies are now generally believed to have accumulated in moderate to deep (up to 2,000 m [6,500 feet]) marine waters. Coarse angular sands probably were deposited from turbidity currents (subaqueous sediment-laden flows); the extraordinary coarse conglomeratic mudstones in some flysch may be a product of submarine mudflows. The term originally was applied to a formation of the Tertiary Period (66.4 to 1.6 million years ago) occurring in the

northern Alpine region but now denotes similar deposits of other ages and other places.

flyting (Scots: "quarreling," or "contention"), poetic competition of the Scottish *makaris* (poets) of the 15th and 16th centuries, in which two highly skilled rivals engaged in a contest of verbal abuse, remarkable for its fierceness and extravagance. Although contestants attacked each other spiritedly, they actually had a professional respect for their rival's vocabulary of invective. The tradition seems to have derived from the Gaelic *filid* (class of professional poets), who composed savage tirades against persons who slighted them. A Scandinavian counterpart is the *Lokasenna* ("Flyting of Loki"), a poem in the *Poetic (Elder) Edda* in which the trickster-god Loki bandies words with the other gods, taunting them with coarse jests. Although true flying became obsolete in Scottish literature after the Middle Ages, the tradition itself never died out among writers of Celtic background. The style and language of Robert Burns's "To a Louse" ("Ye ugly, creepin, blaitit wonner / Detested, shunn'd by saunt an' sinner") parodies earlier Scots flyting, and James Joyce's poem "The Holy Office" is a bard's curse on the society that spurns him.

Examples of true flyting are *The Flying of Dunbar and Kennedie* (the poets William Dunbar and Walter Kennedy) and *Flyting betwixt Montgomerie and Polwart* (the poets Alexander Montgomerie and Sir Patrick Hume of Polwarth).

flyway, route used regularly by migrating birds, bats, or butterflies. The large majority of such migrants move from northern breeding grounds to southern wintering grounds and back, and most of the well-used flyways follow north-south river valleys (e.g., the Mississippi River valley), coastlines (especially those of North America and East Asia), or mountain ranges. A flyway may be only a few hundred metres wide at certain points, such as mountain passes and the crossing points of water bodies; in other places it may be hundreds of kilometres wide. In one notable flyway, hundreds of thousands of storks and large birds of prey from eastern Europe cross the Bosphorus in a narrow stream, spread out over Turkey and around the eastern end of the Mediterranean Sea, then bunch together again to cross the north end of the Suez Canal into Africa.

flywheel, heavy wheel attached to a rotating shaft so as to smooth out delivery of power from a motor to a machine. The inertia of the flywheel opposes and moderates fluctuations in the speed of the engine and stores the excess energy for intermittent use. To oppose speed fluctuations effectively, a flywheel is given a high rotational inertia; i.e., most of its weight

is well out from the axis. A wheel with a heavy rim connected to the central hub by spokes or a web (wheel A in the Figure) has a high rotational inertia. Many flywheels used on reciprocating engines to smooth out the flow of power are made in this way. The energy stored in a flywheel, however, depends on both the weight distribution and the rotary speed; if the speed is doubled, the kinetic energy is quadrupled. A rim-type flywheel will burst at a much lower rotary speed than a disk-type wheel of the same weight and diameter. For minimum weight and high energy-storing capacity, a flywheel may be made of high-strength steel and designed as a tapered disk, thick at the centre and thin at the rim (see wheel B in the Figure).

In automobile engines the flywheel serves to smooth out the pulses of energy provided by the combustion in the cylinders and to provide energy for the compression stroke of the pistons. The larger the rotational inertia of the flywheel, the smaller the changes in speed resulting from the intermittent power supply and demand.

In power presses the actual punching, shearing, and forming are done in only a fraction of the operating cycle. During the longer, nonactive period, the speed of the flywheel is built up slowly by a comparatively low-powered motor. When the press is operating, most of the required energy is provided by the flywheel.

FM, abbreviation of FREQUENCY MODULATION, variation of the frequency of a carrier wave, commonly a radio frequency, in accordance with the characteristics of a signal, such as that produced by the audio frequencies of the human voice or musical instruments. See modulation (in electronics).

Fo, Dario (b. March 24, 1926, Leggiuno-Sangiama, Italy), Italian playwright, manager-director, and actor-mime who was also a theatrical caricaturist, social agitator, and radical clown. He won the 1997 Nobel Prize for Literature.

Fo's first theatrical experience was collaborating on satirical revues for small cabarets and theatres. After his marriage to the actress Franca Rame, they founded the Campagna Dario Fo-Franca Rame in 1959, and their humorous sketches on the television show "Canzonissima" soon made them popular public personalities. They gradually developed an agitprop theatre of politics, often blasphemous and scatological, but rooted in the tradition of commedia dell'arte and blended with what Fo called "unofficial leftism."

In 1968 Fo and Rame founded another acting group, Nuova Scena, with ties to the Italian Communist Party, and in 1970 they started the Collettivo Teatrale La Comune and began to tour factories and other sites where the public gathered. Fo wrote more than 40 plays, coauthoring some of them with Rame. Among his most popular plays are *Morte accidentale di un anarchico* (1974; *Accidental Death of an Anarchist*) and *Non si paga, non si paga!* (1974; *We Can't Pay? We Won't Pay!*). His later works, some of which were written with Rame, include *Tutta casa, letto e chiesa* (1978; "All House, Bed, and Church"; *Adult Orgasm Escapes from the Zoo*), *Female Parts* (1981), *Coppia aperta* (1983; *The Open Couple—Wide Open Even*), *L'uomo nudo e l'uomo in frak* (1985; *One Was Nude and One Wore Tails*), and *Il papa e la strega* (1989; *The Pope and the Witch*). As a performer, Fo is best known for his solo tour de force *Mistero Buffo* (1974; "Comic Mystery"), based on medieval mystery plays but so topical in contemporary content that it changes with each audience.

Fo-shan, Pinyin FOSHAN, city in central Kwangtung sheng (province), China. Fo-shan itself is situated in the delta 10 miles (16 km) southwest of Canton, on a spur of the Canton-San-shui railway. His-

(A) rim-type flywheel; (B) tapered-disk flywheel
Encyclopedia Britannica, Inc.

torically, Fo-shan (originally called Nan-hai) was a subordinate county of nearby Canton.

Fo-shan has always been a prosperous trade centre, with excellent river communications with western Kwangtung province and the Chuang Autonomous Region of Kwangsi and a location at the centre of an extremely productive and populous plain. Its growth was greatly accelerated in the Ming (1368–1644) and Ch'ing (1644–1911/12) periods, when it became the centre of flourishing handicraft industries, specializing in the manufacture of silk threads and silk textiles and in such ancillary handicrafts as embroidery and dyeing. Metal implements and paper also were manufactured. During the 18th century, Fo-shan was known as one of the four greatest commercial centres in China, ranking with Hank'ou. In 1912 it became the seat of Nan-hai county. During the 20th century, Fo-shan suffered badly from the competition of the ever-growing city of Canton and also from the silting up of its waterways, which could only be used by shallow-draft craft.

Before 1949, Fo-shan (meaning "Buddha's Mountain") was a centre of popular religion, manufacturing vast quantities of paper money, firecrackers, images, and incense for use in religious ceremonies. It has experienced some light industrial growth since 1949, especially of its handicraft industries, and it has become a popular tourist destination. Sculptures and handicrafts are displayed in the Ancestral Temple (built about 1200). On the southern edge of the city are the peaks, caves, and waterfalls of scenic Mount Hsi-ch'iao. Pop. (1990) 303,160.

foam, in physical chemistry, a colloidal system (*i.e.*, a dispersion of particles in a continuous medium) in which the particles are gas bubbles and the medium is a liquid. The term also is applied to material in a lightweight cellular spongy or rigid form. Liquid foams are sometimes made relatively long-lasting—*e.g.*, for fire fighting—by adding some substance, called a stabilizer, that prevents or retards the coalescence of the gas bubbles. Of the great variety of substances that act as foam stabilizers, the best known are soaps, detergents, and proteins. Proteins, because they are edible, find wide use as foaming agents in food-stuffs such as whipped cream, marshmallow (made from gelatin and sugar), and meringue (from egg white). The foam used to combat oil fires consists of bubbles of carbon dioxide (liberated from sodium bicarbonate and aluminum sulfate) stabilized by dried blood, glue, or other cheap protein-containing materials. Beer foam is believed to be stabilized by the colloidal constituents present, which include proteins and carbohydrates. Foaming may be undesirable, as in lubricating oils, and its prevention is not always easy. Aqueous foams usually can be broken by treatment with small amounts of certain alcohols.

foam glass, lightweight, opaque glass material having a closed-cell structure. It is made in molds that are packed with crushed or granulated glass mixed with a chemical agent such as carbon or limestone. At the temperature at which the glass grains become soft enough to cohere, the agent gives off a gas that is entrapped in the glass and forms the closed-cell structure that remains after cooling. Foam glass is light enough to float in water and has been used as a substitute for cork, but its main uses are for thermal and sound insulation. It is impervious to moisture, most fumes, and vermin.

foam rubber, also called SPONGE RUBBER, OR LATEX FOAM, flexible, porous substance made from a natural or synthetic latex compounded with various ingredients and whipped into a froth. The resulting product contains roughly 85 percent air and 15 percent rubber and can be molded and vulcanized. Its uses include

padding for furniture, mattresses, and pillows. In special processes, a blowing agent is incorporated into the latex to liberate gas during vulcanization, forming small closed cells; the resulting foam is nonabsorbent and useful for thermal insulation, as in refrigerators. Molded into sheets, it is used in gaskets, weather stripping, and vibration-damping materials.

foamed plastic, synthetic resin converted into a spongelike mass with a closed-cell or open-cell structure, either of which may be flexible or rigid, used for a variety of products including cushioning materials, air filters, furniture, toys, thermal insulation, sponges, plastic boats, panels for buildings, and even lightweight beams. Under appropriate conditions almost any thermosetting or thermoplastic resin can be converted into a foam. Plastics that are commonly foamed include vinyls, polystyrene, polyethylene, phenolics, silicones, cellulose acetate, and urethanes.

Foams with a closed-cell structure are produced by incorporating a blowing agent that decomposes at the fusion point of the plastic, releasing gas bubbles that are trapped during the gelling. Foams with an open-cell structure are produced by incorporating an inert gas into the resin under pressure and then releasing the mixture to the atmosphere and curing the resulting foam.

Foça (Turkey): *see* Phocaea.

focal seizure, type of epilepsy in which the seizure originates in a specific area of the brain, and the onset or entire seizure relates to the functional properties of that area. Focal motor attacks (originating in motor areas of the brain) are characterized by sustained or jerking movements of a part of an extremity or of the face or by coordinated movements of the head and eyes toward one side (adversive movements). A progressive spread of twitching from one part of an extremity to the adjacent parts and then to involvement of the other extremity on the same side or of the face is known as a jacksonian seizure (*see* jacksonian epilepsy). Most focal motor seizures originate in the frontal lobe, but adversive movements occasionally arise from other areas. Focal sensory attacks are characterized by numbness or tingling in local parts of the body. These seizures originate in the cortex of the parietal lobe; the excessive neuronal discharging frequently spreads across the Rolandic fissure to the motor cortex of the adjacent frontal lobe, and localized movements follow. Seizure discharges from either of these areas often spread to involve the remainder of the brain, so that generalized convulsions result. *See also* epilepsy.

Focas, Antonio de Curtis Gagliardi Griffio: *see* Totò.

Foch, Ferdinand (b. Oct. 2, 1851, Tarbes, France—d. March 20, 1929, Paris), marshal of France and commander of Allied forces

Foch
EB Inc.

during the closing months of World War I, generally considered the leader most responsible for the Allied victory.

Early years. Foch was the son of a civil servant. His family had originally lived in Valentine, a village in the Comminges area to which he used to return every year. As a young child he had been inspired by the stories of the campaigns of his maternal grandfather, who had been an officer during the Revolutionary and Napoleonic eras, and by the age of six he was reading the descriptions of military battles he found in historical works.

In 1869 he entered the Jesuit school of Saint-Clément in Metz in order to prepare for the entrance examination for the Polytechnic School. In Metz the experience of France's defeat in the Franco-German War left an indelible impression on him. When he passed his examinations in July 1870, the war had already broken out. Once back home, he enlisted in the army but did not take part in the fighting. In 1871, after the armistice, when he returned to Saint-Clément, he was forced to live alongside the German soldiers who were there. Metz had become a German city. His pain and anger made him resolve to become a soldier and return Metz and the Lorraine region to France.

Rise in the military hierarchy. After two years at the Polytechnic School in Paris, Foch entered artillery training school (1873). As an artillery officer, he proved himself to be both an ardent cavalryman and an experienced technician. After appointment to the Artillery Committee in Paris, he was married (1883) and acquired the château of Trofenteunio in Brittany, which then became his second family home.

In 1885 he entered the War College for the first of three periods there over the next 25 years. He returned as a major in 1895 to teach general tactics, soon becoming a full professor. In 1908, when he was a brigadier general, Prime Minister Georges Clemenceau appointed him head of the school. Foch in the meantime also had held commands and served on various staffs, thus adding to his experience and judgment. He formulated his doctrine of action in two works: *Des principes de la guerre* (1903; *The Principles of War*) and *De la conduite de la guerre* (1904; "On the Conduct of War"). "Thought" and "will" were the key words of these teachings.

After commanding a division in 1911 and briefly commanding an army corps, he was, in August 1913, put in command of the XX Army Corps in Nancy, which protected the Lorraine frontier. It seemed to be the crowning point of Foch's career because he would reach retirement age in three years.

Under Joffre in World War I. When war broke out on Aug. 2, 1914, Foch first fought on the right flank, in Lorraine. On August 28 a dangerous gap appeared in the centre, and the commander in chief, Joseph Joffre, called Foch to command the army detachment—which later became the IX Army—that was being formed there. The enemy tried to break through, but Foch held on. His tenacity made it possible for Joffre to win at the First Battle of the Marne. The same was true at the battles of the Yser and of Ypres, where he had been sent by Joffre to coordinate the efforts of the English, the French, and the Belgians, who were being severely attacked.

For two thankless years—1915 and 1916—Foch, commanding the Northern Army Group, vainly tried to break through the German line in Artois and at the Somme, but he could not compensate for the lack of equipment and supplies. In May 1917 he was appointed chief of the war minister's general staff, a position that made him adviser to the Allied armies. But advising was not com-

manding. Russia was about to collapse, thus allowing Germany to bring all its forces back to the Western Front, where the Belgians, English, and French were lined up under separate commands. Foch predicted that when the Germans struck this poorly consolidated front, each force would think only of its own fate, and that the front would be broken up. He advocated establishing a single command, but the British prime minister David Lloyd George and Clemenceau (again appointed premier in November) refused to listen to Foch.

Events, however, were to prove Foch right. On March 21, 1918, the British front in Picardy collapsed under the impact of the German attack. By March 24, British commander Field Marshal Douglas Haig was thinking about his embarkation ports, and French commander General Philippe Pétain was thinking about Paris. The severance of the two armies had begun. The Germans, who quickly perceived the situation, were already crying victory.

Commander of the Allied armies. Lloyd George and Clemenceau realized that Foch was only person who could fill the void. By early May, Foch had been made commander in chief of all Allied armies on the Western and Italian fronts. The battle of two wills began: Erich Ludendorff, who was in virtual command of the German forces, versus Foch. Ludendorff, who had the initiative and superiority in numbers, redoubled his attacks. Foch resorted to parrying while waiting for the arrival of the American armies. He urged his men on to the limits of their endurance and succeeded in stopping Ludendorff in Picardy and then in Flanders. But, in order to support the English, who were being pushed back to the sea by Ludendorff, Foch withdrew troops from the French front. Ludendorff took advantage of this. On May 27 he broke through that front, and his troops spread as far as the Marne. On June 9 a new gap appeared at the Oise: Foch stopped it up again. Ludendorff then decided to gamble everything he had before the Americans joined the battle. On July 15 he made a massive attack in Champagne. Two days later he was stopped; he had lost.

It was now Foch's turn to strike. In two offensives on July 18 and on August 8, Foch drove Ludendorff back to a defensive position. The honour of marshal of France was conferred on Foch on August 6, just as he was intensifying his offensive on the Germans, giving no respite to the enemy nor to his own troops. Finally, the German army, already exhausted and dwindling in numbers, was threatened with disintegration by the revolution in Germany and was abandoned by its allies. Germany was forced to ask for an armistice, the conditions of which were dictated by Marshal Foch in the name of the Allies on Nov. 11, 1918, at Rethondes. On November 26 Foch returned to Metz, having succeeded in his lifelong goal of giving Alsace and Lorraine back to France.

After the war Foch was showered with honours, including being made marshal of Great Britain and of Poland. He was buried near Napoleon under the dome of the Church of Saint-Louis, in the Invalides in Paris.

Focșani, city, capital of Vrancea județ (county), east-central Romania. The city lies 100 miles (160 km) north-northeast of Bucharest. It is situated on the Milcov River,

which was once the boundary between Moldavia and Walachia. In the city is a monument marking the old frontier. Focșani is the centre of a wine-making region that has been famous for its vineyards since the 15th century. Focșani is also an industrial city, processing dairy products and manufacturing furniture and clothing. Pop. (1992 prelim.) 101,296.

focusing, also called OCULAR ACCOMMODATION, adjustment of the eye to see things at different distances. (The term also is applied to the adjustment of man-made lenses, as in a camera or microscope.)

In fish, the eyes are focused by altering the distance between lens and retina, much as occurs in a camera, where the distance between lens and light-sensitive film is adjusted. In humans and other mammals the forward surface of the lens is made more convex for seeing closer objects, and the pupil becomes smaller; at the same time, the two eyes turn inward enough (*i.e.*, cross) so that their gaze is fixed on the object. The capsule, or envelope enclosing the lens of the eye, is attached by ligaments to the ringlike ciliary muscle. The inside diameter of this muscle is greatest when the muscle is relaxed, smallest when it is contracted. Thus, when the gaze is fixed on a distant object, as when a camera is set at infinity, the ciliary muscle relaxes, the muscle's inside diameter is increased, more pull is exerted on the lens by the ligaments, and the front surface of the lens is flattened. When near objects are viewed the ciliary muscle contracts, the ligaments relax, and the lens, being elastic, bulges in front and gains more curvature.

Fodor, Eugene (b. Oct. 14, 1905, Léva, Hung., Austria-Hungary [now Levice, Slovakia]—d. Feb. 18, 1991, Torrington, Conn., U.S.), Hungarian-born American travel writer who created a series of popular tourist guidebooks that provided entertaining reading, historical background, and cultural insights into the people and places described, as well as reliable, practical information designed to assist even the most inexperienced traveler.

Fodor studied political economy in Czechoslovakia (B.A., 1924), in Grenoble, France, and in Hamburg, Ger. He went to work as an interpreter for a French shipping company, writing in his spare time articles about exotic ports of call and life aboard ship. He submitted travel articles to French and Hungarian newspapers, and his evident love of adventure and flair for languages (he spoke five) soon brought him work as a travel correspondent and editor in Prague (1930–33) and London (1934–38). His first book, 1936—*On the Continent*, was a best-seller in Europe and the United States. Fodor was on a business trip in the United States at the outset of World War II, and he remained there, becoming a naturalized citizen in 1942 and serving in the U.S. Army's intelligence unit for five years. In 1949 he settled in Paris and founded Fodor's Modern Guides, Inc., to publish detailed, easy-to-understand travel guides to specific countries. He returned to the United States in 1964, and many of the later Fodor guides were written about the United States. Fodor sold his company in 1968.

foedus, plural FOEDERA, treaty or compact contracted by ancient Rome with one or more allied states (*foederati*). The treaty contained various conditions establishing permanent friendly relations between the contracting parties. A *foedus aequum* was a bilateral agreement recognizing both parties as equals obliged to assist each other in defensive wars or when otherwise called upon, in perpetuity. A *foedus iniquum* defined Rome as superior, the second party being bound to assist Rome in offensive wars, thus limiting the ally's sovereignty. *Foedera* were inscribed on bronze tablets and kept in the Capitol at Rome.

The earliest-known *foedus* is the Foedus Cassianum signed by the consul Spurius Cassius in 493 BC, which established a common army of defense between the Romans and the collective Latin states. As Rome gained dominance over the Italian peninsula, the Latin, Etruscan, and Italian polities lost their status as equals, eventually becoming provinces of Rome. Similarly, earlier Roman treaties with states outside Italy were usually equal, but the growth of Roman power in the Mediterranean eventually led to the subordination of the *foederati*. In time they lost both their local autonomy and their freedom from payment of tribute; this was especially true in the western provinces of the empire (after 27 BC). Certain peoples and rulers, however, termed *socii et amici populi Romani* ("allies and friends of the Roman people") were given intermediate status between complete autonomy and organization as a Roman province. They usually paid tribute to Rome, while Rome was spared the burden of direct rule—which meant not having to underwrite the cost of defensive forces that would be a drain on the Roman treasury. Such status, however, was a privilege that could be revoked at any time.

foehn, German FÖHN, warm and dry, gusty wind that periodically descends the leeward slopes of nearly all mountains and mountain ranges. The name was first applied to a wind of this kind that occurs in the Alps, where the phenomenon was first studied.

A foehn results from the ascent of moist air up the windward slopes; as this air climbs, it expands and cools until it becomes saturated with water vapour, after which it cools more slowly because its moisture is condensing as rain or snow, releasing latent heat. By the time it reaches the peaks and stops climbing, the air is quite dry. The ridges of the mountains are usually obscured by a bank of clouds known as a foehn wall, which marks the upper limit of precipitation on the windward slopes. As the air makes its leeward descent, it is compressed and warms rapidly all the way downslope because there is little water left to evaporate and absorb heat; thus, the air is warmer and drier when it reaches the foot of the leeward slope than when it begins its windward ascent.

Foehn winds in various parts of the world have local names: chinook in the North American Rockies, *ghibli* in Libya, and *zonda* in the Andes of Argentina.

foenugreek (herb): see fenugreek.

foetus: see fetus.

fog, cloud of small water droplets near ground level and sufficiently dense to reduce horizontal visibility to less than 1,000 m (3,281 feet). The word fog also may refer to clouds of smoke particles, ice particles, or mixtures of these components. Under similar conditions, but with visibility greater than 1,000 m, the phenomenon is termed a mist or haze, depending on whether the obscurity is caused by water drops or solid particles.

Fog is formed by the condensation of water vapour on condensation nuclei that are always present in natural air. This results as soon as the relative humidity of the air exceeds saturation by a fraction of 1 percent. In highly polluted air the nuclei may grow sufficiently to cause fog at humidities of 95 percent or less. Growth of the drops may be helped by the absorption of certain soluble gases, notably sulfur dioxide to form dilute sulfuric acid. The relative humidity of the air can be increased by three processes: cooling of the air by adiabatic expansion; mixing two humid airstreams having different temperatures; and direct cooling of the air by radiation.

The first process, adiabatic expansion, is responsible for the formation of clouds and plays a part in the formation of upslope fogs that are formed by the forced ascent of humid air up the sides of hills and mountains.

The mixing process is manifest when air that has been in contact with a wet ground or water surface having a different temperature from that of the air above is mixed with this air.

The most stable fogs occur when the surface is colder than the air above; that is, in the presence of a temperature inversion. Fogs also can occur when cold air moves over a warm, wet surface and becomes saturated by the evaporation of moisture from the underlying surface. Convection currents, however, tend to carry the fog upward as it forms, and it appears to rise as steam or smoke from the wet surface. This is the explanation of steam fogs that are produced when cold Arctic air moves over lakes, streams, inlets of the sea, or newly formed openings in the pack ice; hence, the term Arctic sea smoke.

Advection fog is formed by the slow passage of relatively warm, moist, stable air over a colder wet surface. It is common at sea whenever cold and warm ocean currents are in close proximity and may affect adjacent coasts. A good example is provided by the frequent dense fogs formed off the Grand Banks of Newfoundland in summer, when winds from the warm Gulf Stream blow over the cold Labrador Current. It also may occur over land, especially in winter when warm air blows over frozen or snow-covered ground (Figure 1). Advection fogs occur most readily with winds of about 5 m per second (10 miles per hour), sufficiently light to maintain a temperature contrast between air and surface and not strong enough to produce turbulent mixing through a considerable depth of the atmosphere. Typical advection fogs extend up to heights of a few hundred metres and sometimes also occur together with radiation fogs.

Radiation fog forms over land on calm, clear nights when loss of heat by radiation cools the ground and chills the air in the lowest few metres to below the dew-point temperature. Once dense fog has formed, the top of the fog replaces the ground as the effective surface cooled by radiation, and the fog increases progressively in depth as long as there is sufficiently moist air above it. The development of a strong temperature inversion tends to stabilize the fog and suppress air motions, but slow, turbulent stirring motions usually are present and probably are important in maintaining the fog. They do so by replacing the air in the lowest layers—which is losing moisture by deposition on the ground—with moister air from above. Typical inland radiation fogs reach to heights of 100 to 200 m.

Inversion fogs are formed as a result of a downward extension of a layer of stratus cloud, situated under the base of a low-level temperature inversion. They are particularly prevalent off western coasts in tropical regions during the summer, when the prevailing winds blow toward the Equator and cause the upwelling of cold water along the coast. Air that passes over the cold water becomes chilled, its relative humidity rises, and it becomes trapped under the inversion. Subsequent noc-

Figure 1: Formation of stratus cloud and fog beneath a frontal surface

turnal cooling may then cause a stratus layer to form and build down to the ground to form an inversion fog as demonstrated in Figure 2.

Frontal fog forms near a front when raindrops, falling from relatively warm air above a frontal surface, evaporate into cooler air close to the Earth's surface and cause it to become saturated.

When the air temperature falls below 0° C (32° F) the fog droplets become supercooled. At temperatures between 0° and -10° C (32° and 14° F), only a small proportion of the droplets freeze, and the fog is composed mainly or entirely of liquid water. However, at lower temperatures, more and more droplets freeze, so that below about -35° C (-31° F)—and certainly below -40° C (-40° F)—the fog is composed entirely of ice crystals. The visibility in an ice fog is often considerably worse than that in a water fog containing the same concentration of condensed water.

Although it is convenient to classify fogs according to the physical processes that produce saturation of the air, it is difficult to apply such a clear-cut classification in practice. Typically, more than one of the processes acts at the same time, and their relative importance varies from case to case and with time. Probably no two fogs are controlled by exactly the same combination of factors, a fact that makes forecasting the formation and dispersal of fog difficult.

In most areas subject to fog, the frequency and persistence of the fogs show a marked seasonal dependence. Conditions favourable to the formation of radiation fog—namely, clear

Figure 2: Formation of inversion fog

skies and light winds—often occur in the central regions of anticyclones (see anticyclone) and ridges of high pressure, so that the advantages of dry, settled weather are often nullified by the occurrence of fog, especially in autumn and winter. Advection fog may occur in any season of the year and at any time of day or night and is not restricted to conditions of light winds and clear skies. Over land it is especially liable to occur in winter, when mild, damp air flows over a frozen or snow-covered surface. Over the coastal waters of the British Isles, it occurs chiefly in late spring and early summer when the sea is still cold.

Dense fog presents one of the greatest hazards to aviation and to nearly all forms of surface transportation. Modern aircraft generally are not allowed to take off or land if the visibility along the runway is less than 600 m. In many countries, especially those in temperate latitudes, fog causes widespread dislocation and delay in transportation systems on several days each year.

fog dispersal, artificial dissipation of fogs, usually by seeding or heating. It is done primarily at airports to improve visibility. Many attempts have been made to clear fogs at temperatures above freezing by seeding them with salt particles and by heating them with burners, but these techniques remain fairly undependable. Fog dispersal at temperatures below freezing, however, is regularly performed at many airports by seeding them with solid carbon dioxide or with propane gas sprayed from the ground. Compare cloud seeding.

fog signal, sound or light signal emitted in fog or mist by lighthouses and buoys to indicate a shoreline, channel, or dangerous stretch of water and by vessels to indicate their position.

Each signal has a distinctive code. All vessels, whether stationary or moving, are required by law to utilize fog signals in inclement weather; the type, number, length, and timing of the signal indicate the size of the vessel and its position. The nature and application of fog warnings is codified in the International Regulations for Preventing Collisions at Sea (commonly called International Rules of the Road), applicable to all international waters. The earliest sound signals were made by bells, gongs, and explosives; these largely have been replaced by foghorns powered by compressed air or electricity. See also lighthouse.

Fogaras (Romania): see Făgăraș.

Fogazzaro, Antonio (b. March 25, 1842, Vicenza, Republic of Venice [Italy]—d. March 7, 1911, Vicenza), Italian novelist whose works reflect the conflict between reason and faith.

Fogazzaro came from a wealthy family. He cultivated his interest in music and literature at his leisure and established his reputation as a novelist only late in life with *Malombra* (1881; *The Woman*), *Daniele Cortis* (1885; *Daniele Cortis*), and *Il mistero del poeta* (1888; *The Poet's Mystery*). His best-known work, *Piccolo mondo antico* (1896; *The Little World of the Past*), was highly acclaimed, even by critics unsympathetic to his religious and philosophical ideas.

Fogazzaro became a member of the Italian Senate in 1896. He was the author of short stories and plays as well as of novels, and his poetry is collected in *Valsolda* (1886).

Fogel, Robert William (b. July 1, 1926, New York, N.Y., U.S.), American economist who, with Douglass C. North, was awarded the Nobel Memorial Prize for Economic Science in 1993. The two were cited for developing cliometrics, the application of statistical analysis to the study of economic history.

Fogel attended Cornell University (B.A., 1948), Columbia University (M.A., 1960), and Johns Hopkins University (Ph.D., 1963); he later received M.A. degrees from the University of Cambridge (1975) and Harvard University (1976). After teaching at Johns Hopkins and the University of Rochester (N.Y.), he joined the faculty of the University of Chicago (1964). He accepted a position at Harvard (1975-81), after which he returned to Chicago.

Fogel first attracted attention in the early 1960s, when he utilized statistical analysis to argue that the development of railroads in the United States in the 19th century had contributed little to the overall growth of the economy. The publication in 1974 of *Time on the Cross: The Economics of American Negro Slavery*, which he wrote with Stanley L. Engerman, generated considerable controversy, because it contended that slavery had been a profitable enterprise that had collapsed for political, rather than economic, reasons. The resulting furor over this theory compelled Fogel to write a defense of his work, *Without Consent or Contract: The Rise and Fall of American Slavery* (1989), which included a moral condemnation of slavery and clarified his earlier research.

Fogerty, Elsie (b. Dec. 16, 1865, London, Eng.—d. July 4, 1945, Leamington, Warwickshire). British teacher of voice and dramatic diction, a major figure in theatrical training.

Trained under Hermann Vezin and at the Paris Conservatoire, Fogerty in 1889 became a teacher of elocution at the Crystal Palace School of Art and Literature and later at Sir Frank Benson's London School of Acting. In 1906 she founded the Central School of Speech Training and Dramatic Art in London, which she directed until her death. Among her pupils were Sybil Thorndike, Peggy Ashcroft, John Gielgud, and Laurence Olivier. She adapted

and produced a number of classical Greek plays to support her advocacy of the study and use of choral speaking and wrote several treatises, the best known of which is *The Speaking of English Verse* (1923). She also pioneered in speech therapy.

Fogie (1967) was compiled and edited by Marion Cole, a student of Fogarty.

Fogg Art Museum, museum founded at Harvard University in Cambridge, Mass., in 1895 as a study collection of Eastern and Western art from prehistory to the present, as well as an important art reference library of more than 150,000 volumes. The Fogg Museum is especially distinguished for its collection of drawings and prints.

Its research fields include classical art, coins, conservation, drawings, Islâmic and Oriental art, photography, and prints. The Busch-Reisinger Museum at Harvard is a subsidiary.

foggara (water-supply system): *see* qanât.

Foggia, city, capital of Foggia province. Puglia (Apulia) region, southeastern Italy, in the centre of the Puglia Tableland, west-northwest of Barletta.

Foggia is believed to have been founded by the inhabitants of Arpi (also called Argyrippa, Greek Argos Hippion), a Greek and Roman town that declined after the Second Punic War (3rd century BC); the ruins of Arpi are a few miles north. Foggia may have been named after local pits or cellars used for grain storage, or after (Latin *foveae*) that supply drinking water for the flocks, still called *fogge*. It was a favourite seat of the Holy Roman emperor Frederick II, who had the town's fortifications dismantled after it supported the pope in the latter's struggle with him. It passed to Charles I of Anjou, king of Naples and Sicily, who died there in 1285. From 1447 to 1806 it was the centre for collection of the sheep tax on flocks migrating between highlands and plains. After the restoration following the Napoleonic Wars, it became a centre for Carbonari revolutionary societies and took a vigorous part in the revolts of 1820, 1848, and 1860 against the Kingdom of Naples. The capture of the Foggia military airfields in 1943 was an important action in consolidating the Allied position in southern Italy in World War II.

Partially destroyed by an earthquake in 1731 and severely damaged in World War II, Foggia has been rebuilt along modern lines. Only a door remains of Frederick II's palace, but the cathedral, begun by William II the Good, king of Sicily, with Baroque alterations, survives. There are a museum, a picture gallery, and a library, the archives of which include those of the sheep tax.

Foggia lies on the main railway from Bologna to Bari and is also connected by rail with Naples. A major wool market for centuries, Foggia is also an important agricultural centre for the wheat, vegetables, olives, grapes, fruit, tobacco, and cheese of the Puglia Tableland. In addition to food industries, there are cellulose and paper mills. Pop. (2000 est.) mun., 154,891.

Fogo Island, Portuguese ILHA DO FOGO, island of Cape Verde, in the Atlantic Ocean, about 400 mi (640 km) off the West African coast between the islands of São Tiago (Santiago) and Brava. It has an area of 184 sq mi (476 sq km). The island's active volcano, Pico (9,281 ft [2,829 m]), is the highest point of the archipelago. Peanuts (groundnuts), beans, coffee, oranges, and tobacco are grown on the

Street scene in São Filipe, Fogo Island

Walter Imber

north and west sides of the island. The chief town is São Filipe, on the west shore. Pop. (2000) 37,409.

föhn (wind): *see* foehn.

foie gras (French: "fat liver"), a delicacy of French cuisine, the liver of a goose or duck that has been fattened by a process of force feeding. What is generally regarded as the best foie gras is produced in the province of Strasbourg. Foie gras is ideally very firm and smoothly textured, with a colouring of creamy white tinged with pink.

Foie gras is often baked in a crust, as *pâté de foie gras*, which may be served hot or cold. The *pâté*, or pastry crust, is lined with jelly and the foie gras is prepared with brandy, seasonings, and truffles. Foie gras may also be served in purée form with bread or toast and jelly, with garnishes or pancakes, or in terrines.

foil, solid metal that has been reduced to a leaflike thinness by mechanical beating or rolling. Jewellers have long used a thin foil of copper-zinc alloy as backing for paste jewels and inferior gemstones. The colour and lustre of the gems is heightened by foil that has been silvered, burnished, and coated with translucent colouring.

The first mass-produced and widely used foil was made from tin, now replaced by aluminum for nearly all purposes. The reduction of sheet metal to foil is achieved principally through vertical pressure exerted by finishing-mill rolls combined with horizontal tension applied through mandrels paying out and rewinding the foil stock. Backup rolls mounted above the work rolls of the finishing mills provide increased vertical pressure. Finishing mills may be two, three, or four rolls high, depending on the foil width and thickness required. To produce very light gauge (thin) material, two sheets of aluminum may be rolled together, then parted and rewound individually. By rolling a double web, foil is produced that is bright on one side and matte finished on the other. Aluminum foil may be coloured, printed, embossed, bonded to other materials, or coated with a plastic film. *See also* tinfoil.

foil, a sword with a light, flexible blade of rectangular cross section tapering to a blunt point. Designed as a practice weapon for the smallsword fashionable in the 17th century, it is now used primarily in the sport of fencing.

The modern fencing foil has a maximum overall length of 110 centimetres (3 feet, 7 inches) and a maximum weight of 500 grams (about 17.5 ounces), although it is usually lighter for greater speed of movement. The blade is of finely tempered steel up to 900 millimetres (35.4 inches) long, with a usually circular handguard up to 120 millimetres in diameter.

There are two principal forms: the French, with a plain, slightly curved handle, and the Italian, with a crossbar about 5 cm behind the guard and a strap that binds the weapon to the wrist. The Italian foil provides a somewhat stronger grip, whereas the French gives greater freedom of action to the fingers and wrist.

The foil is the only weapon used in international competition by both men and women. In contests, touches must be made with the point on a target that includes the trunk from the top of the collar to the groin lines in front and to a line across the top of the hips in back. The target for both women and men has been the same since 1960. A retreat of more than 4 metres (13 feet) also scores a touch against the defender. Other touches are foul but incur no penalty other than stopping the action and voiding any touches made between the time of the foul and resumption of the match.

An attacker generally has the right-of-way, and the defender must parry, or neutralize, the attack before making a counterattack (*riposte*). A double touch is scored for the fencer who has the right-of-way. An electrical scoring apparatus was adopted for international events in 1956, but judges still rule on right-of-way.

The first to score five touches (four in women's events) against an opponent is the winner.

Fencing with the foil has long been a standard international and Olympic Games event. *See* Sporting Record: *Fencing*. *See* Olympic Games.

foil, in architecture, leaf-shaped, indented spaces which, combined with cusps (small, projecting arcs outlining the leaf design), are found especially in the tracery (decorative openwork) of Gothic windows. The term is derived from the Latin *folium*, meaning "leaf." A window or wall ornamented with foils is referred to as foiled. There are three kinds of

Typical foil shapes used in Gothic architectural decoration

From M.S. Briggs, *Everyman's Concise Encyclopaedia of Architecture*. E.P. Dutton & Co., Inc., and J.M. Dent & Sons Ltd

such stylized foliated decoration: trefoil, quatrefoil, and cinquefoil, or three-, four-, and five-lobed leaves.

Foix, feudal county of southwestern France, corresponding approximately to the modern *département* of Ariège. Between the 11th and the 15th century, the counts of Foix built up a quasi-independent power bounded by Languedoc on the north and on the east, by the territories of the counts of Roussillon and of the kings of Aragon on the south, and by those of the counts of Comminges and of Armagnac on the west.

At the beginning of the 11th century the town of Foix, from which the county took its name, belonged to the counts of Carcassonne. In his will (1002), Roger I of Carcassonne left "the land of Foix." Consérans (Cousérans), and some adjacent domains to his second son,

Bernard, who was styled count of Consérans and lord of Foix. The first count of Foix was this Bernard's second son, Roger I (died c. 1064), whose descendants held the countship for three centuries. The most famous of this line was Gaston III Phoebus. On the death of his successor in 1398, the countship passed to a collateral line, Foix-Grailly, which in the 15th century became involved through marriage in the affairs of Navarre. As a result of family alliances, Foix, Béarn, and Navarre passed to the House of Albret in 1484. The heiress Jeanne d'Albret (1528–72), by her marriage to Anthony of Bourbon, passed her possessions on to her son, the future Henry IV of France. On his accession (1589) Foix became part of the crown lands.

Foix, town, capital of Ariège département, Midi-Pyrénées region, southwestern France, located in the foothills of the Pyrenees. Situated 1,250 ft (380 m) above sea level, at the fork where the Arget River joins the Ariège, it is dominated by its medieval castle, which stands on a high rock. The restored (19th-century) castle has three towers (12th–15th century) and some ruined walls. A museum is housed in the keep. When the town was the capital of the counts of Foix, the castle resisted repeated sieges (1212–17) by the Norman crusader Simon de Montfort, but was taken by King Philip the Bold of France in 1272. Modern Foix is a market town and tourist centre. Pop. (1982) 9,212.

Fokine, Michel, original name МИХАИЛ МИХАЙЛОВИЧ ФОКИНЕ (b. April 23 [April 11, old style], 1880, St. Petersburg, Russia—d. Aug. 22, 1942, New York City), dancer and choreographer who profoundly influenced the 20th-century classical ballet repertoire. In 1905 he composed the solo *The Dying Swan* for the Russian ballerina Anna Pavlova. As chief choreographer for the impresario Sergey Diaghilev's Ballets Russes from 1909 to 1914, he created *L'Oiseau de feu* (1910; *The Firebird*) and *Petrushka* (1911).

Fokine was born of a prosperous middle-class family and entered the Imperial Ballet School at the Mariinsky Theatre in 1889, where he distinguished himself for the breadth of his interests and studies. Fokine was talented not only as a dancer but also as a student of music and painting. He had a fresh and inquiring attitude toward everything connected with the ballet and began quite early to plan

choreography, to seek appropriate music in the school library, and to sketch designs. His development as a dancer—he made his debut with the Imperial Russian Ballet on his 18th birthday—was paralleled by his development as a choreographer and designer.

In 1904 he wrote the scenario for his first ballet, which was based on the ancient Greco-Roman legend of Daphnis and Chloe. He sent it to the director of the Imperial Theatre with a note about reforms he wanted to see adopted by choreographers and producers. His crusade for artistic unity in ballet had already begun, but at this stage it made little impact. He was not encouraged to produce *Daphnis et Chloé* (he created it later, in 1912, for Diaghilev).

All the same, although at St. Petersburg he had no power to implement his beliefs, he began to work as a choreographer. His first ballet, created in 1905 for performance by his pupils, was *Acis et Galatée*, based on an ancient Sicilian legend. Fokine's enthusiasm for antiquity owed nothing in origin to the "free dance" ideas of the American dancer Isadora Duncan, although her appearance in Russia in 1905 greatly consolidated his own views. In 1905 he also composed the brief solo *The Dying Swan* for the Russian ballerina Anna Pavlova. He continued to create ballets and three of his Mariinsky works were included in revised versions in the momentous season of the Ballets Russes that the impresario Sergey Diaghilev arranged in Paris in 1909: *Le Pavillon d'Armide*, *Une Nuit d'Égypte* (*Cléopâtre*), and *Chopiniana* (*Les Sylphides*).

Fokine was an integral part of the Ballets Russes's Paris triumph. Diaghilev's genius for bringing artists together in successful collaboration made Fokine, as his chief choreographer, the link between the dancers Tamara Karsavina, Vaslav Nijinsky, and Adolph Bolm; the designers Alexandre Benois and Léon Bakst; and the composer Igor Stravinsky, in such superbly unified creations as *L'Oiseau de feu* and *Petrushka*.

Fokine's relationship with the Diaghilev ballet deteriorated when Diaghilev launched Nijinsky as choreographer; but he remained with the company until 1914, when he returned to Russia. Also in that year, he set down his manifesto on ballet in a letter to *The Times* (London), advocating the creation in each ballet of a new form of movement corresponding to the subject, period, and character of the music; that dancing and mime have no meaning unless they express dramatic action; that conventional mime should be used only when the style of the ballet requires it; otherwise, meaning should be expressed by the movement of the whole body; that this expressiveness should extend from the individual to the group, to ensembles as much as to solos; and that there should be complete equality in the alliance of the component arts that make up a ballet—dance, music, and scenic and costume design.

Fokine left Russia in 1918 and made his home in New York City from 1923. He worked with various companies in the U.S. and Europe, creating new ballets, such as *L'Épreuve d'amour* (1936) and *Don Juan* (1936). None of these later ballets, however, had the impact of his earlier work. He began his last ballet, a comedy, *Helen of Troy*, for the American Ballet Theatre shortly before his death. It was completed by David Lichine and was premiered at Mexico City on Sept. 10, 1942. His wife, the dancer Vera Fokina, who had performed in many of his ballets, survived him until 1958.

One of the few choreographers to come to a first rehearsal with clear and complete ideas for a ballet, Fokine had great facility and speed in choreographic invention, intense musicality, and the ability to memorize an orchestral score. He was by no means equable at work. Tamara Karsavina wrote in her autobiography *Theatre Street* that "he was extremely irritable

and had no control of his temper," but she emphasized that dancers became devoted to him.

The vocabulary of classical ballet has been enormously extended since Fokine's day, and subsequent audiences sometimes feel that his choreography is dated. Those of his ballets remaining in production have inevitably suffered distortion. He himself was conscious that this would happen. "The longer a ballet exists in the repertoire," he wrote in his *Memoirs*, "the further it departs from its original version. . . . After my death the public, watching my ballets, will think 'What nonsense Fokine staged!'" (K.S.W.)

BIBLIOGRAPHY. *Memoirs of a Ballet Master*, ed. by Anatole Chujoy, trans. by Vitale Fokine (1961), is a valuable but condensed version of Fokine's own memoirs. Cyril W. Beaumont, *Michel Fokine and His Ballets* (1935), is an account by an English ballet historian and critic.

Fokis (Greece): see Phocis.

Fokker, Anthony Herman Gerard (b. April 6, 1890, Kediri, Java, Netherlands East Indies—d. Dec. 23, 1939, New York City), Dutch airman and pioneer aircraft manufacturer who, during World War I, produced more than 40 types of airplanes (designed by Reinhold Platz) for the German High Command. Initially, he offered his designs to both combatants, but the Allies turned him down.

Fokker
Ullstein Bilderdienst

Fokker built his first plane in 1910 and taught himself to fly. In 1912 he established a small aircraft factory at Johannisthal near Berlin. During World War I he introduced the gear system that made it possible to fire a machine gun through the propeller arc without hitting the blades; the propeller itself, by means of levers and gears, operated the gun at properly timed intervals.

In the early 1920s Fokker sold an increasing number of planes to the U.S. military, and in 1922 he established the Atlantic Aircraft Corp. in New Jersey. He also maintained a large aircraft factory in The Netherlands. The first nonstop flight across the United States was made in the Fokker T-2 transport. Richard Byrd and Floyd Bennett flew over the North Pole (May 9, 1926) in one of Fokker's trimotor planes. During the 1920s and the 1930s Fokker concentrated on the design and development of commercial aircraft that were widely used in the fledgling U.S. commercial aviation industry. His autobiography, *The Flying Dutchman*, was published in 1931.

folacin (vitamin): see folic acid.

Folard, Jean-Charles, chevalier de (knight of) (b. Feb. 13, 1669, Avignon, Fr.—d. March 23, 1752, Avignon), French soldier and military theorist who championed the use of infantry columns instead of battle lines in warfare. Although he had a small but influential following during his lifetime, his concepts were not generally accepted by Europe's mili-

Fokine as Perseus in *Medusa*

tary establishment. During the 18th and 19th centuries, the increasing firepower and accuracy of cannons and rifles finally made his ideas increasingly impractical.

Folard, lithograph by Antoine-François Sergent-Marceau, 1790
By courtesy of the Bibliothèque Nationale, Paris

Serving in the French army during the War of the Spanish Succession (1701–14) and from 1714 under Charles XII of Sweden, Folard developed his tactical ideas, which he published as *Nouvelles Découvertes sur la guerre...* (1724; "New Discoveries on War"). A second treatise followed a few years later. Folard believed that firepower alone was not sufficient to bring victory. He suggested the shock of a deep mass of troops in the form of infantry columns used in conjunction with battle lines as the answer. Part of Folard's justification was the small range of contemporary firearms. France's marshal Maurice de Saxe and Austria's Guido von Starhemberg approved his tactics; but most other authorities disagreed, and Folard died in obscurity. Though French armies during the early 1790s won several victories using infantry columns, advances in military technology eventually proved his ideas untenable.

fold, in geology, undulation or waves in the stratified rocks of the Earth's crust. Stratified rocks were originally formed from sediments that were deposited in flat, horizontal sheets, but in a number of places the strata are no longer horizontal but have been warped. Sometimes the warping is so gentle that the inclination of the strata is barely perceptible, or the warping may be so pronounced that the strata of the two flanks may be essentially parallel or lie nearly flat (as in the case of a recumbent fold). Folds vary widely in size; some are several kilometres or even hundreds of kilometres across, and others measure just a few centimetres or less. The tops of large folds are commonly eroded away on the Earth's surface, exposing the cross sections of the inclined strata.

Figure 1: Three forms of folds

Folds are generally classified according to the attitude of their axes and their appearance in cross sections perpendicular to the trend of the fold. As shown in Figure 1, the axial plane of a fold is the plane or surface that divides the fold as symmetrically as possible. The axial plane may be vertical, horizontal, or inclined at any intermediate angle, as in the folds in Figure 2. An axis of a fold is the intersection

of the axial plane with one of the strata of which the fold is composed.

Although in the simpler types of folds the axis is horizontal or gently inclined, it may be steeply inclined or even vertical. The angle of inclination of the axis, as measured from the horizontal, is called the plunge. The portions of the fold between adjacent axes form the flanks, limbs, or slopes of a fold.

An anticline is a fold that is convex upward, and a syncline is a fold that is concave upward (Figure 2). An anticlinorium is a large anticline on which minor folds are superimposed, and a synclinorium is a large syncline on which minor folds are superimposed. A symmetrical fold (Figure 2) is one in which the axial plane is vertical. An asymmetrical fold (Figure 2) is one in which the axial plane is inclined. An overturned fold, or overfold, has the axial plane inclined to such an extent that the strata on one limb are overturned (Figure 2). A recumbent fold has an essentially horizontal axial plane (Figure 2). When the two limbs of a fold are essentially parallel to each other and thus approximately parallel to the axial plane, the fold is called isoclinal.

Figure 2: Folds, progressively decreasing from left to right in the inclination of the axial plane

Many folds are distinctly linear; that is, their extent parallel to the axis is many times their width. Some folds, however, are not linear but are more or less circular in plan. A dome is such a fold that is convex upward; this means that its strata dip outward from a central area. A basin is a circular fold that is concave upward—i.e., the strata dip inward toward a central area.

The long linear folds that are characteristic of mountainous regions are believed to have resulted from compressional forces acting parallel to the surface of the Earth and at right angles to the fold. Some geologists believe that many folds are the result of strata sliding from a vertically uplifted area under the influence of gravity. The push exerted by an advancing glacier also may throw weakly consolidated rocks into folds, and the compaction of sedimentary rocks over buried hills gives rise to gentle folds. In nature, folds are rarely produced by a single process but by a combination of processes.

Folda, fjord, Nordland *fylke* (county), northern Norway. The fjord's mouth opens into Vest Fjord of the Norwegian Sea and is 25 miles (40 km) northeast of the town of Bodo and about 75 miles (120 km) north of the Arctic Circle. The Folda extends two branches inland: the Nordfolda, 25 miles (40 km) long, and the Sørfolda, 18 miles (29 km) in length. Each is dotted with small fishing villages; herring is the main catch. The heads of both branches are crossed by the North Cape (Nordkapp) Highway connecting the counties north of the fjord with the more densely settled portion of the country to the south.

Folengo, Teofilo, original name GIROLAMO FOLENGO (b. Nov. 8, 1491, Mantua [Italy]—d. Dec. 9, 1544, near Bassano Campese, Republic of Venice), Italian inventor of verse written in macaronics (*q.v.*), a synthetic combination of Italian and Latin.

Folengo entered the Benedictine order as a young man, taking the name Teofilo by which he is known. He lived in the monasteries of Brescia, Mantua, and Padova (Padua), then left the order in about 1525. After 1530 he lived as a hermit near Sorrento, then was readmitted to the Benedictine order in 1534 and remained in it until his death.

Though he wrote much poetry in various forms, Folengo's masterpiece is *Baldus*, a 20-book poem in macaronic hexameters, published under the pseudonym Merlin Cocai. Four versions of *Baldus* are known, published in 1517, 1521, 1539–40, and 1552 (modern edition, *Le maccheronee*, 1927–28). Written with a rich vein of satire, humour, and fan-

Folengo, portrait by an unknown artist, 16th century
Alinari—Art Resource/EB Inc

tasy, Folengo's poem narrates the adventures of a rustic hero, Baldus, descendant of the medieval epic hero Roland's cousin Rinaldo.

Folger, Henry Clay (b. June 18, 1857, New York, N.Y., U.S.—d. June 11, 1930, Brooklyn, N.Y.). American lawyer, business executive, and founder of the Folger Shakespeare Library in Washington, D.C.

At Amherst College Folger won prizes in English composition and oratory, was elected to Phi Beta Kappa, and developed an interest in Shakespeare. After graduation in 1879 he studied law at Columbia University, earning the LL.B. degree in 1881. As a student he worked for Pratt and Company, which was part of the Standard Oil group of companies. In 1908 he became a director of the Standard Oil Company of New York and in 1911 became its president. Under his direction the firm prospered, and he was made chairman of the board in 1923. A man of diverse cultural interests, he gradually built up a collection of Shakespeareana. In 1928 he announced plans for a library of Shakespearean materials, which was built on Capitol Hill in Washington, D.C.

Folger Shakespeare Library, research centre in Washington, D.C., for the study of William Shakespeare, his contemporaries, Elizabethan society and culture, and 16th- and 17th-century British drama, literature, and history. The library, with approximately 250,000

Modern reproduction of an Elizabethan stage in the Folger Shakespeare Library, Washington, D.C.
Seymour Linden

volumes and 40,000 manuscripts, possesses an unrivaled collection of Shakespeare's folios—79 copies of the first folio (1623), 58 copies of the second folio (1632), and 24 copies of the third folio (1663–64)—and constitutes the second largest collection of English books printed prior to 1641. It also possesses world-famous collections of 18th- and 19th-century theatrical materials (such as theatre playbills, theatre programs, promptbooks, and costumes); 16th- and 17th-century French political pamphlets;

tracts by various Reformation leaders including Martin Luther; and materials associated with Desiderius Erasmus and John Dryden. The library also contains musical instruments, costumes, and films. Completed in 1932 and administered by the trustees of Amherst College, the library is named after Henry Clay Folger, a Standard Oil Company of New York executive whose will bequeathed his Shakespeare collection to the American people and provided the necessary funds to house, maintain, and expand it. The reading room is open only to advanced scholars. An exhibition gallery and a model Elizabethan theatre are open to the public. Publications include a "Folger Facsimile" series, a series of booklets for the general reader, and *Shakespeare Quarterly*.

BIBLIOGRAPHY. Betty Ann Kane, *The Widening Circle: The Story of the Folger Shakespeare Library and Its Collections* (1976).

foliation, planar arrangement of structural or textural features in any rock type, but particularly that resulting from the alignment of constituent mineral grains of a metamorphic rock of the regional variety along straight or wavy planes. Foliation often occurs parallel to original bedding, but it may not be ostensibly related to any other structural direction. Foliation is exhibited most prominently by sheeted minerals, such as mica or chlorite.

Regional metamorphic rocks are usually subdivided into schist, slate, and gneiss on the basis of grain size and foliation type. The schists, for example, exhibit strong foliation with partings along well-defined planes of medium-grained micas or hornblendes. The gneisses, which are characteristically rich in feldspar and quartz, tend to be coarse-grained and less distinctly foliated. They do not split, or cleave, along their planes as schists do. A few contact-metamorphic rocks are foliated, but most, such as hornfels and granulite, tend to be granular.

folic acid, also called PTEROYLGLUTAMIC ACID, FOLATE, or FOLACIN, a vitamin of the B complex that is essential in animal metabolism and that is needed by bacteria as a growth factor. It is required by all higher animals studied, but the requirement is difficult to demonstrate in some animals because the vitamin is synthesized by bacteria contained in an animal's intestinal tract. In humans and other mammals, folic acid is necessary for the synthesis of nucleic acids and the formation of heme, the pigmented, iron-carrying component of the hemoglobin in red blood cells.

The vitamin has a wide variety of sources in the human diet, including leafy green vegetables, citrus fruits, cereals, beans, poultry, and egg yolks. A deficient intake of folic acid can impair the maturation of young red blood cells, resulting in folic-acid-deficiency anemia. Pregnant women with an insufficient intake of folic acid are more likely to give birth prematurely or to deliver babies with low birth weight or with neural tube defects. The sulfa drugs are thought to achieve their antimicrobial effects by interfering with the production of folic acid within bacteria. *See also* folic-acid-deficiency anemia; tropical sprue.

folic-acid-deficiency anemia, type of anemia that is a result of a deficient intake of folic acid. This B vitamin is needed for the formation of heme, the pigmented, iron-containing portion of the hemoglobin in red blood cells. A deficient intake of folic acid impairs the maturation of young red blood cells, which results in anemia. The disease is characterized by deficiency of red blood cells (anemia) and often white cells (leukopenia) and platelets (thrombocytopenia) in the circulation, ineffective blood formation in the bone marrow, and progressive gastrointestinal problems. Folic-acid deficiency develops over a period of several months and may result from a diet that

is low or lacking in foods containing folic acid. The deficiency may also be caused by intestinal malabsorption, cirrhosis of the liver, or anticonvulsant-drug therapy. It may also occur in the last three months of pregnancy and in persons with severe hemolytic anemia (dissolution of red blood cells by hemolysin). In infants it can result from a diet of unsupplemented goat's milk or dried milk.

The symptoms and signs of folic-acid deficiency include a blood picture indistinguishable from that of pernicious anemia, with megaloblastic bone marrow, macrocytes in the circulation, and marked gastrointestinal problems, such as sore tongue, fissures at corners of the mouth, diarrhea, inflammation of the pharynx or esophagus or both, and ulceration of the stomach and intestines. Treatment is specific: the administration of folic acid by mouth produces quick improvement in all symptoms; an adequate diet results in cure in cases due to simple malnutrition.

Folies-Bergère, Parisian music hall and variety-entertainment theatre that is one of the major tourist attractions of France. Following its opening in a new theatre on May 1, 1869, the Folies became one of the first major music halls in Paris. During its early years it presented a mixed program of operetta and pantomime, with the renowned mime Pierre Legrand performing the latter.

In 1887 the Folies' highly popular revue entitled "Place aux Jeunes" established it as the premiere nightspot in Paris. By the last decade of the 19th century, the theatre's repertory encompassed musical comedies and revues, operettas, vaudeville sketches, playlets, ballets, eccentric dancers, acrobats, jugglers, tightrope walkers, and magicians. When the vogue of nudity seized the music halls of Paris in 1894, the Folies elaborated it to such an extent that the theatre's reputation for sensational displays of female nudity came to overshadow its other performances.

The Folies achieved international repute under the management of Paul Derval (from 1918 to 1966). He staged a series of sumptuous and grandiose spectacles featuring beautiful young women parading in a state of near nudity (despite their gaudy costumes) against exotic backdrops. Parisians and tourists alike were also attracted to the singers, acrobats, and dramatic sketches that made up the rest of the program. The Folies has showcased the talents of many of the great entertainers and music-hall artists of France from the late 19th century on. Among these have been Yvette Guilbert, Mistinguett, Fernandel, Josephine Baker, and Maurice Chevalier.

The Folies-Bergère was managed by Hélène Martini from 1974. Each of its shows requires about 10 months of planning and preparation, 40 different sets, and 1,000 to 1,200 individually designed costumes. The titles of all the Folies' shows since the late 1880s have each consisted of a total of 13 letters.

Foligno, Latin FULGINIUM, town, Perugia *provincia*, Umbria *regione*, central Italy. It lies along the Topino River, southeast of Perugia. Originally an Umbrian settlement, the present site is that of the Roman town of Fulginium and still reflects the Romans' regular street plan. The town's importance lay in its command of the main pass between the Umbrian plain (west) and the Adriatic coast (east). A powerful rival of medieval Perugia, Foligno prospered greatly under the government of the Trinci family as semi-independent deputies of the Holy See (1305-1439). After their fall at the hands of Pope Eugenius IV in 1439, the town became part of the Papal States until 1860. Foligno was the seat of a flourishing school of painting in the 15th century. The town was badly damaged by an earthquake in 1832 and was largely rebuilt following heavy bombing in World War II.

Among the principal monuments of inter-

est in the town are the cathedral (1133-1201; restored), the Romanesque-style Church of Santa Maria Infra Portas, and the Trinci Palace (1389-1407), which houses the archaeological museum and the picture gallery. Raphael's "Madonna di Foligno," now in the Vatican, was painted for the Italian nobleman Sigismondo di Comitibus. The first edition of Dante's poem *La divina commedia* was printed (1472) in Foligno's Orfini Palace.

A commercial and industrial centre, Foligno has sugar refineries and metallurgical, textile, building-materials, and paper and timber industries. Pop. (1993 est.) mun., 53,091.

Foliot, Gilbert: *see* Gilbert Foliot.

folk art, any genre of art produced by peasants, pastoralists, seamen, artisans, or tradespeople who live away from urban centres in societies that are not highly industrialized. Folk art can also be the art of social or ethnic minorities that have preserved earlier traits by living apart, culturally and frequently physically. Sometimes the art produced by urban dwellers who lack formal training also is considered folk art. The term embraces the fields of literature, music, dance, and the visual arts.

Folklore, religion, and superstition all contribute to the style, content, and motifs of a folk art within a particular grouping. Folk art is not static and rigid, and new themes are constantly evolving from traditional forms to meet new circumstances. Folk art reaches across national boundaries, and any comparative study must take into account all the cultural, traditional, and environmental considerations that affect it.

A brief treatment of folk art follows. For full treatment, *see* MACROPAEDIA: Folk Arts.

Folk literature. Folk literature is the oral lore of cultures with no written language and has at some time been produced by nearly all known peoples. It even exists side by side with the written record in advanced cultures, being carried on by children and by the illiterate, but in many urbanized areas it is gradually being replaced by books and newspapers, radio, and television. Major forms of folk literature include the folk song, ballad, fable, folktale, proverb, riddle, and charm.

One of the most enduring forms of folk literature is the folk song; this is typically a song that lives in oral tradition, is learned through hearing rather than reading, and is disseminated within families and restricted social networks. Folk songs worldwide are characterized by their close association with the routine activities of daily life. The traditional roles of the folk song were to transmit news and gossip, document local genealogies and history, and preserve the lore and literature of a people. In modern times many of these needs are met by the mass media, and some collectors have feared that folk traditions are dying. In fact, folk songs now fulfill new functions, such as symbolizing the unity and identity of a minority group. A vast repertoire of native folk songs has grown up in the United States, centred on that country's history, regions, and diverse ethnic and social groups.

The folktale is a prose story that is transmitted orally through many generations. Folktales may contain elements of myths, often devoid of religious meaning; but many scholars draw no firm dividing line between myth and folktale. Motifs (e.g., grateful beasts, tests, return of the dead) and skeletal plots (types) appear in various genres of tales. Folktales have traveled from culture to culture and into and out of written literature.

Among genres of folktales are *Märchen*, or fairy tales and household tales; local traditions (legends, or *Sagen*); saints' legends; animal tales; trickster stories; tales of heroes; jests; or merry tales; and etiological tales (*Natursagen*

or *pourquoi* stories), explaining how a natural phenomenon, animal feature, or institution of society came to be. The saga is a Scandinavian literary culmination of an orally transmitted prose tale. See also fairy tale; legend; Märchen.

Folk music. Folk music, learned through hearing, is disseminated within families and restricted social networks. It survives independently of both classical and popular music and is recreated constantly by the performers who learn, play, and sing it. Each country tends to have a repertoire of its own tunes, which change when they cross ethnic or cultural boundaries. Of the four major groups of folk instruments, the simplest consists of rattles, flutes, bullroarers, whistles, and long, wooden trumpets such as the alpenhorn. The second group, taken to Europe and the Americas from other cultures, includes bagpipes, folk oboes, banjos, xylophones, and folk fiddles. The third, made up of instruments developed in European folk cultures from simple materials, is represented by the *Dolle*, a fiddle fashioned from a wooden shoe, and the bowed lyre. The fourth, and most important, group is composed of instruments from urban music culture, though sometimes changed drastically: the violin, bass viol, clarinet, guitar, violin with sympathetic strings, and hurdy-gurdy.

In order to survive, a new folk composition must be accepted by the community and in some way reflect their values and taste. But musicians are free to vary and embellish (or simplify) the original model as it is passed down from one generation to the next. This process, known as communal re-creation, is essential to the development of a genuine folk tradition. Modern recording techniques pose a threat to this feature of folk art, perpetuating a single variant and thus inhibiting innovation and change.

Most traditional folk melodies are monophonic (having one part), although polyphonic forms (having two or more simultaneous parts) are found in southern and eastern Europe; the *ganga* of the Balkan region, for example, have parallel major and minor seconds, an unusual and exciting dissonance for the Western listener. Multi-part choral singing is common in the Caucasus. Rounds are another common form of rudimentary folk polyphony. Most folk melodies are strophic (having repeated stanzas, often of four lines). Exceptions include children's songs, which are usually very simple, and epics, particularly those of eastern Europe, which often consist of a single line repeated, varied, and embellished. Rhythm in folk songs often owes much to the local language and its patterns of stress. In many European countries $\frac{3}{4}$ and $\frac{4}{4}$ are most typical, but in Bulgaria and some other areas *aksak* (Turkish: "limping") rhythm is common, characterized by asymmetrical rhythmic patterns.

Folk music often embodies something of a people's character, and composers have long turned to it for ideas and inspiration. This well-established practice became especially conspicuous with the burgeoning of nationalist sentiment during the late 19th century. Composers such as the Hungarians Béla Bartók and Zoltán Kodály, the British musicians Ralph Vaughan Williams and Frederick Delius, the Norwegian Edvard Grieg, and the American Aaron Copland all relied heavily on the folk idiom. In India there is constant cross-fertilization between the *rāgas* (modes) and *tālas* (rhythmic formulas) of classical music (often called the "great" tradition) and the melodies and metres of the village folk songs (the "little" tradition).

Folk dance. Defined variously as traditional dance as it evolves from everyday activities, as native dance having magical or economic

functions, or as dance performed nonprofessionally; folk dance generally excludes primitive, theatrical, classical, and popular forms of dance. Rural folk dance frequently reveals ancient ritual origins and serves recreational purposes, while urban equivalents may be much more recent and serve secular purposes. Both celebrate original festivals, such as those based on local calendars for agricultural ecology, but also have adapted to church festival calendars. Almost universally the older, experienced men and women are the leaders in folk dance, with the children serving as apprentices, though generally the individual of any age or sex is submerged in the larger society and must fit into the dance group harmoniously.

The folk dances that were recorded and described in most European countries during the first half of the 20th century fall into two main groups: (1) the ritual-ceremonial and (2) the social. The dances in the first group are, except in a very few instances (such as certain harvest dances of eastern Europe), performed by men. Derived from pre-Christian religious ceremony, the ritual dances are typically associated with local annual customs, which can be grouped under such seasonal events as: winter carnival, Easter, May Day, and midsummer. The customs may include some dance action together with ritual drama, such as Christmas mumming and carnival masquerading, or they may be composed wholly of dance, as in the English morris dance and other young men's dances of the European spring festivals.

The second group includes all those dances in which the unit is the man-woman couple with sex relationship as a dominant feature. Social folk dances possibly originated when the young medicine men shared their magic-making with the unmarried girls in a ceremonial fertility rite. Many examples of communal processions and chains survive in Europe, such as the farandole, the floral, and the different types of maypole dance. The English, Scottish, and Irish country dances have evolved from the "long" dance processions and from the maypole rounds. Adapted through the centuries to indoor dancing, they attracted the interest and ingenuity of dancing masters and musicians, who composed on the old base a continuing stream of new dances for the social dancers in court and hall. This stream of folk-type dances overflowed their countries of origin to mix with and fertilize homegrown forms, as in the North American square dance.

Couple folk dances are also of ancient origin with erotic content, as in the Spanish jota, the Italian saltarello, and the somewhat more acrobatic displays of the man partner in the Basque *auresku* and the "halling" of Norway.

A number of social folk dances traditional to particular countries, such as the Austrian waltz, the Czech polkas, and the Argentine tango, have established themselves as cosmopolitan ballroom dances or have provided the basis for such dances. Stage dancing, including the classical forms of ballet, constantly borrows and has borrowed from folk sources of many countries to enrich its content and techniques. Meanwhile the ancient country customs and the rustic levels persisted, often receiving reinforcement in the shape of a new step or rhythm or even a complete dance that had briefly been the rage in the fashionable dance world.

Visual folk art. Predominantly functional or utilitarian, visual folk art is typically created by hand for use by the maker or a small circumscribed group and contains an element of retention—the prolonged survival of tradition. Natural, local materials—such as straw, wood, and leather—and common, even crude, tools are usually utilized. Visual folk art is the creative expression of man's struggle toward civilization within his particular environment through the production of useful but aesthetic buildings and objects.

Although folk art has produced painted pictures meant to be hung on the wall, such as the portraits and local scenes of American folk art, most painted depictions in folk art are incorporated as decorative features of other objects, such as clock faces, chests, and chairs. Paintings on exterior walls are widespread in the folk art of Europe, North Africa, and India.

In sculpture, folk art has produced religious objects, toys, and decorative items, as well as such useful objects as bottles, flasks, and candlesticks in sculpted form. Wood has served as an almost universal medium, but stone and metal have also been used.

The designs of basic residential dwellings and simple public buildings may be considered the architectural component of the visual folk arts. The Alpine house of Switzerland and the log cabin of the American frontier are examples of residential folk architecture, while the wooden churches of Eastern Europe are representative of folk architecture in public buildings. Other common examples of visual folk arts are prints made from wood blocks, scrimshaw (the carving of whalebone), and the design of pottery, textiles, and costumes.

folk high school, type of residential school for adults that is standard in Scandinavian countries and has also been adopted elsewhere in Europe. The concept of the folk high school was originated in Denmark by the theologian N.F.S. Grundtvig as a means of providing the common people with a knowledge of their history, religion, and cultural heritage. The model school for the movement was established by the young educator Kristen Kold in 1851 and was soon extensively imitated. Following Denmark's military defeat by Prussia in 1864, these folk high schools served as a powerful instrument of national regeneration. There are no entrance qualifications or leaving examinations; attendance is completely voluntary. The atmosphere is homelike. Students and teachers live, work, and play together. The singing of hymns and folksongs is characteristic. Subjects of general interest in literature and social science predominate. Most students are young adults, originally rural workers, but now urban as well. The schools are private but receive state subsidies, and many folk high schools attract an international body of students.

folk society, an ideal type or concept of society that is completely cohesive—morally, religiously, politically, and socially—because of the small numbers and isolated state of the people, because of the relatively unmediated personal quality of social interaction, and because the entire world of experience is permeated with religious meaning, the understanding and expression of which are shared by all members. The folk society is generally assumed to be the model of preliterate or so-called primitive societies that anthropologists have traditionally studied.

The most important and enduring modern effort to make the concept of folk culture relevant to anthropology remains the work of the U.S. anthropologist Robert Redfield, who saw folk society as including not only primitive groups but also peasant peoples whose operations entailed some degree of dependence on the city (see peasantry). Although criticized for this interpretation of peasant life, as well as for underrating the impersonal and economic values and relations that may obtain in folk societies, Redfield's construction of the ideal folk culture continues to be the authoritative ideal type. Especially significant characteristics of folk society, as Redfield saw it, are its self-conception as the vessel of the sacred (this conception endowing the moral order with absolute authority and rendering the life-styles rigidly conventionalized) and its quality of being the whole of social and spir-

itual reality, with functions satisfying all the needs of an individual from birth, through all his life crises and transitions, to death

Folkers, Karl August (b. Sept. 1, 1906, Decatur, Ill., U.S.), U.S. chemist whose research on vitamins resulted in the isolation of vitamin B₁₂, the only effective agent known in countering pernicious anemia.

In 1934 Folkers joined the research laboratories of Merck and Co., Inc., Rahway, N.J. His early work included pioneering studies of curare, erythrina alkaloids, and morphine alkaloids. During the 1930s his research team synthesized and helped establish the chemical structure of numerous B-vitamins.

Folkers' search for the antipernicious anemia factor, begun in 1938, ended in 1948 with the isolation of a red crystalline compound now called vitamin B₁₂. His research team also discovered mevalonic acid, which is a key substance in the production of numerous important biochemical compounds, including carotenoids, steroids, and terpenes.

In 1948 Folkers' team isolated, synthesized, and determined the structure of numerous members of the streptomycin group of antibiotics. His work also encompassed the antibiotics penicillin, grisein, oxamycin, neomycin, and novobiocin.

Folkers served as president of the Stanford Research Institute, Menlo Park, Calif., from 1963 to 1968 and then became director of the Institute for Biomedical Research at the University of Texas, Austin.

Folkestone, town, Shepway district, county of Kent, England. Once a "limb" of the Cinque Port of Dover (7 mi [11 km] east), Folkestone shared that town's privileges and duties until, in 1629, the local inhabitants obtained a license to build a port. From the beginning of the railway age, Folkestone developed both as a cross-Channel passenger port (Boulogne, Fr., lies 26 mi away) and as a high-class seaside resort. Along the sandy cliff to the west, the Leas, a broad promenade with lawns, extends 2 mi to Sandgate above the shore road and gardens. William Harvey, the 17th-century physician, was a native and is commemorated by a statue on the Leas.

In 1805, under threat of French invasion, three defensive Martello towers were built east of the town. There the railway line to Dover follows a difficult course by cuttings and tunnels in the chalk cliffs. Like Dover, Folkestone was considerably damaged in World War II both by enemy raids and cross-Channel artillery bombardment. Located outside the town is a popular racecourse. Pop. (1991) 45,587.

folklore, in modern usage, an academic discipline the subject matter of which (also called folklore) comprises the sum total of traditionally derived and orally or imitatively transmitted literature, material culture, and custom of subcultures within predominantly literate and technologically advanced societies; comparable study among wholly or mainly nonliterate societies belongs to the disciplines of ethnology and anthropology. In popular usage, the term folklore is sometimes restricted to the oral literature tradition.

A brief treatment of folklore scholarship follows. For full treatment of the discipline and its subject matter, see MACROPAEDIA: Folk Arts.

Folklore studies began in the early 19th century. The first folklorists concentrated exclusively upon rural peasants, preferably uneducated, and a few other groups relatively untouched by modern ways (e.g., gypsies). Their aim was to trace preserved archaic customs and beliefs to their remote origins in

order to trace the mental history of mankind. In Germany, Jacob Grimm used folklore to illuminate Germanic religion of the Dark Ages. In Britain, Sir Edward Tylor, Andrew Lang, and others combined data from anthropology and folklore to "reconstruct" the beliefs and rituals of prehistoric man. The best-known work of this type is Sir James Frazer's *The Golden Bough* (1890).

Large collections of material were amassed in the course of these efforts. Inspired by the Grimm Brothers, whose first collection of fairy tales appeared in 1812, scholars all over Europe began recording and publishing oral literature of many genres: fairy tales and other types of folktales, ballads and other songs, oral epics, folk plays, riddles, proverbs, etc. Similar work was undertaken for music, dance, and traditional arts and crafts; many archives and museums were founded. Often the underlying impulse was nationalistic; since the folklore of a group reinforced its sense of ethnic identity, it figured prominently in many struggles for political independence and national unity.

As the scholarship of folklore developed, an important advance was the classification of material for comparative analysis. Standards of identification were devised, notably for ballads (by F.J. Child) and for the plots and component motifs of folktales and myths (by Antti Aarne and Stith Thompson). Using these, Finnish scholars, led by Kaarle Krohn, developed the "historical-geographical" method of research, in which every known variant of a particular tale, ballad, riddle, or other item was classified as to place and date of collection in order to study distribution patterns and reconstruct "original" forms. This method, more statistical and less speculative than that of the anthropological folklorists, dominated the field throughout the first half of the 20th century.

After World War II new trends emerged, particularly in the United States. Interest was no longer confined to rural communities, since it was recognized that cities too contained definable groups whose characteristic arts, customs, and values marked their identity. Although some Marxist scholars continued to regard folklore as belonging solely to the working classes, in other circles the concept lost its restrictions of class and even of educational level; any group that expressed its inner cohesion by maintaining shared traditions qualified as a "folk," whether the linking factor be occupation, language, place of residence, age, religion, or ethnic origin. Emphasis also shifted from the past to the present, from the search for origins to the investigation of present meaning and function. Change and adaptation within tradition were no longer necessarily regarded as corruptive.

In the view of "contextual" and "performance" analysis in the late 20th century, a particular story, song, drama, or custom constitutes more than a mere instance to be recorded and compared with others of the same category. Rather, each phenomenon is regarded as an event arising from the interaction between an individual and his social group, which fulfills some function and satisfies some need for both performer and audience. In this functionalist sociological view, such an event can be understood only within its total context; the performer's biography and personality, his role in the community, his repertoire and artistry, the role of the audience, and the occasion on which the performance occurs all contribute to its folkloric meaning.

folkway, the learned behaviour, shared by a social group, that provides a traditional mode of conduct. According to the American sociologist William Graham Sumner, who coined the term, folkways are social conventions that are not considered to be of moral significance by members of the group (e.g., customary behaviour for use of the telephone). The folk-

ways of groups, like the habits of individuals, originate in the frequent repetition of acts that prove successful for satisfying basic human needs. These acts become uniform and are widely accepted. Folkways operate primarily at an unconscious level and persist because they are expedient. They tend to group themselves around major social concerns, such as sex, forming social institutions (e.g., the family). Sumner believed that folkways from diverse areas of life tended to become consistent with each other, creating definite patterns.

Tradition, habit, and religious sanctions tend to strengthen folkways as time passes, making them more and more arbitrary, positive, and compelling. Some folkways become mores (borrowed from the Latin word for customs by Sumner) when they become ethical principles, the behaviours considered essential to the welfare of the society. Mores are more coercive than folkways: relatively mild disapproval follows an infringement of a folkway; severe disapproval or punishment follows the breaking of mores. Polygamy violates the mores of American society; failure to wait one's turn in line is a breach of folkways.

Sumner saw folkways and mores as essentially conservative and doubted the ability of members of the society to change them consciously. The small variations introduced by individuals in their observance, however, allows for some change, according to Sumner. See also norm.

Follen, Adolf Ludwig, also called AUGUST ADOLF FOLLENIUS (b. Jan. 21, 1794, Giessen, Hesse—d. Dec. 26, 1855, Bern), German political and Romantic poet, an important founder and leader of radical student groups in the early 19th century.

While studying at Giessen in 1814, he founded the democratic Deutsche Lesegesellschaft (German Reading Society). Expelled for his political views in 1815, he went to Heidelberg, where he was among the founders of the political student association Teutonia. With his brother, Karl, he was also the leader of the Unbedingten (Uncompromising Ones), or Schwarzen (Blacks), a radical student group whose ideas resulted in the assassination of the conservative dramatist August Kotzebue in 1819. Based on an idealized picture of the medieval Christian empire, Follen's political ideas were aimed at incorporating the German states into a national, united, Christian republic. He expressed these goals in his collection of songs, *Freye Stimmen frischer Jugend* (1819; "Free Voices of Fresh Youth").

Banished after a political trial, Follen moved to Switzerland, where he taught at Aarau (1821–27) and published *Harfen-Güsse aus Deutschland und der Schweiz* (1823; "Harp Greetings from Germany and Switzerland"). Follen also wrote non-political poetry, inspired, like his political ideas, by a Romantic enthusiasm for the Middle Ages. This sentiment is evident in his ballads on events in Swiss history, in his novel *Malagys und Vivian* (1829), and in *Siegfrieds-Tod* (1840; "Siegfried's Death"), a ballad of part of the *Nibelungenlied*. His last important work was the epic poem *Tristans Eltern* (1857; "Tristan's Parents").

Follett, Mary Parker (b. Sept. 3, 1868, Quincy, Mass., U.S.—d. Dec. 18, 1933, Boston), U.S. author and sociologist who was a pioneer in the study of interpersonal relations and personnel management.

Interested in social work early in her career, Follett organized social centres in Boston schools in the opening years of the 20th century. Later she participated in the development of vocational guidance programs in the school system. From these experiences she developed new ideas about the importance in

an industrialized society of small neighbourhood groups emphasizing individual responsibility and the creative encounter—ideas that she expressed in *The New State* (1918) and *Creative Experience* (1924).

During the last years of her life she lectured extensively on the various aspects of industrial management and served as a consultant to business executives and government administrators.

follicle-stimulating hormone (FSH), one of two gonadotropic hormones (*i.e.*, hormones concerned with the regulation of the activity of the gonads, or sex glands) produced by the pituitary gland. FSH, a glycoprotein operating in conjunction with luteinizing hormone (LH), stimulates development of the graafian follicle, a small, egg-containing vesicle in the ovary of the female mammal; in the male, it promotes the development of the tubules of the testes and the differentiation of sperm. Though in the male the presence of FSH is necessary for the maturation of spermatozoa, additional FSH may not be required for months because testosterone can maintain this activity. In the female, however, there is a rhythmic, or cyclical, increase and decrease of FSH, which is essential for monthly ovulation. *See also* luteinizing hormone; menstruation.

folly (from French *folie*, “foolishness”), also called **EYECATCHER**, in architecture, a costly, generally nonfunctional building that was erected to enhance a natural landscape. Follies first gained popularity in England, and they were particularly in vogue during the 18th and early 19th centuries, when landscape design was dominated by the tenets of Romanticism (*q.v.*). Thus, depending on the designer's or owner's tastes, a folly might be constructed to resemble a medieval tower, a ruined castle overgrown with vines, or a crumbling Classical temple complete with fallen, eroded columns.

Folly at Hagley Hall, Hereford and Worcester, built by Sanderson Miller, 1749–50

A.F. Kersting

During this period in landscape design, much care was taken to emphasize the landscape's pictorial qualities, such that a distinct foreground, middle ground, and background could be perceived; to suit the general design purposes, follies were usually built on a much smaller scale than the buildings they imitated. Though follies were sometimes used as pavilions, they were typically built for visual effect alone, and, with other deliberately wrought effects—such as simulated grottoes and rocky chasms—they were intended to improve or complete the natural setting.

In the United States, the term folly has

also been applied to ornate gazebos or garden pavilions.

Folquet DE MARSEILLE, also called **FOULQUES DE TOULOUSE** (b. c. 1155, Marseille?, Provence [France]—d. Dec. 25, 1231, Toulouse), Provençal troubadour and cleric.

Born into a Genoese merchant family, Folquet left his life as a merchant to become a poet in about 1180. He was widely respected and successful throughout Provence and Aragon. His works, which include love lyrics (often dedicated to his patron's wife), crusading songs, and religious poems, demonstrate a classical education and careful metrical forms. In 1195 Folquet, with his wife and children, entered a Cistercian abbey and renounced his love poetry. He became abbot and, in about 1205, bishop of Toulouse, in which capacity he engaged in persecuting the Albigensians and helped to found the University of Toulouse.

Folsom complex, an early archaeological complex of North America characterized by a distinct leaf-shaped projectile point called a Folsom point. The Folsom complex of artifacts, which also includes a variety of scrapers, knives, and blades, was one variety of the Paleo-Indian hunting cultures; it centred in the Great Plains, beginning sometime prior to 10,000 BC, and involved the hunting of large animals, now mostly extinct. Much of the importance of the Folsom complex derives from the fact that the initial discovery at Folsom, N.M., in 1926 marked the first association in the Americas of man-made artifacts with the bones of long-extinct mammalian forms. Similar associations were also found at such locations as the Lindenmeier site in eastern Colorado (*see also* Clovis complex).

The classic Folsom point is a more or less leaf-shaped, or lanceolate, point with a concave base, projecting ears at the basal corners, and fluted sides. In addition, the Folsom complex includes unfluted points, blunt-tipped knives, scrapers, and bone tools. Most Folsom

Fomalhaut was associated with the Roman goddess Ceres (associated with the analogous Sicilian and Greek goddess Demeter) and was worshipped; in astrology it is one of four royal stars.

Fon, also called **DAHOMÉY**, people living in the south of Benin (called Dahomey until 1975) and adjacent parts of Togo. Speaking a dialect of Ewe, a language of the Kwa branch of the Niger-Congo family of African languages, the Fon numbered some 3,010,000 in the late 20th century.

Iron statue of the god of arms and war, made by the Fon of Benin, in the Musée de l'Homme, Paris

Marc and Evelyn Bernheim—Woodfin Camp and Associates

The traditional economy of the Fon is based on agriculture, relying mainly on corn (maize), cassava, and yams for subsistence; palm oil is the major commercial product. Men clear and hoe the fields, and both men and women plant; the crops are tended and harvested by women. A cooperative organization of adult males aids in such tasks as land clearing and house building. Each village also has a group of professional hunters who are surrounded by supernatural sanctions. Craft specialists include male ironworkers and weavers and female pottery makers.

The primary Fon social unit is the polygynous family, each woman and her children occupying a house within a compound. A lineage, consisting of families related through male descent, usually occupies several neighbouring compounds; the eldest male member serves as the lineage head. Patrilineal clans dispersed throughout Dahomey were formerly important, but clan organization has broken down in recent times. The worship of ancestors, however, remains a major feature of Fon religion.

The village under a hereditary chief was traditionally the primary political unit. In the Kingdom of Dahomey, which flourished in the 18th and 19th centuries, the chiefs were representatives of a powerful king. A main function of the kingship was the conduct of war, which was followed by the Annual Custom, at which prisoners were sacrificed and the goodwill of royal ancestors was sought. The king also exercised judicial powers, collected tribute, and filled political offices. In general, members of the royal clan did not hold political offices because it was believed

artifacts have been discovered in various parts of the Great Plains. The majority of datable artifacts seem to fall in the period between 9000 and 8000 BC.

Fomalhaut, also called **ALPHA PISCIS AUSTRINI**, the 18th star (excluding the Sun) in order of apparent brightness. It is used in navigation because of its conspicuous place in a sky region otherwise lacking in bright stars. It lies in the southern constellation Piscis Austrinus, about 22.5 light-years from the Earth. A white star, it has an apparent magnitude of 1.18. A sixth-magnitude companion star is yellow.

they would be tempted to intrigue against the king; important posts were filled by commoners who would owe their appointment to the king and thus remain loyal.

Fond du Lac, city, seat (1836) of Fond du Lac county, Wisconsin, U.S. It lies at the southern end of Lake Winnebago, 55 miles (89 km) north-northwest of Milwaukee. It originated in 1785 as a French trading post, named for its location at the "farther end of the lake." Laid out by speculators in 1835, the town attracted many German immigrants. The economy was originally based on lumbering but is now diversified and depends primarily on dairy farming and manufacturing (machine tools, dairy equipment, leather, auto ignition parts, and outboard motors). The Episcopal Cathedral of St. Paul has wood carvings from Oberammergau, Ger. Marian College of Fond du Lac was established in 1936, and the University of Wisconsin centre at Fond du Lac in 1968.-Inc. village, 1847; city, 1952. Pop. (1990) 37,757.

Fonda, Henry (Jaynes) (b. May 16, 1905, Grand Island, Neb., U.S.—d. Aug. 12, 1982, Los Angeles, Calif.), American stage and motion-picture actor.

Developing an interest in community theatre, Fonda abandoned studies in journalism at the University of Minnesota to pursue an acting career in New York City. A series of minor Broadway roles in the 1930s led to a leading role in the play *The Farmer Takes a Wife* (1934), in which he subsequently made his movie debut in 1935. He was introduced as a leading film actor in *You Only Live Once* (1937) and went on to establish a distinctively American screen persona in such films as *Young Mr. Lincoln* (1939), *Drums Along the Mohawk* (1939), *The Grapes of Wrath* (1940), and *My Darling Clementine* (1946). He typically played a thoughtful, even ingenuous man of great honesty and integrity.

Fonda was a versatile actor with a simple, natural style who could deliver skillful performances in romantic comedies (*The Lady Eve*, 1941), suspense thrillers (*The Wrong Man*, 1957), and socially significant dramas (*The Ox-Bow Incident*, 1943, and *Twelve Angry Men*, 1957). In the 1955 film version of *Mister Roberts*, he reprised his Tony Award-winning Broadway stage performance in the title role. The following decades saw his appearances in such films as *Fail-Safe* (1963) and *Sometimes a Great Notion* (1971), interspersed with stage roles, most notably as Clarence Darrow in a one-man show (1974). In 1978 the American Film Institute honoured him with its Life Achievement Award, and in 1982 he received an Academy Award as best actor for his performance in the previous year's film *On Golden Pond*. He was the father of the actress Jane Fonda and the actor Peter Fonda.

Fonda, Jane, in full JANE SEYMOUR FONDA (b. Dec. 21, 1937, New York, N.Y., U.S.), American motion-picture actress who was also noted for her political activism.

The daughter of actor Henry Fonda, she left Vassar College after two years and lived in New York City. She studied acting under Lee Strasberg at the Actors Studio there in 1958 and worked as a model. Her acting career began with appearances in the Broadway play *There Was a Little Girl* (1960) and the motion picture *Tall Story* (1960), and she went on to appear in comic roles in numerous films in the 1960s, including *Cat Ballou* (1965) and *Barefoot in the Park* (1967). Her subsequent, more substantial roles were in such socially conscious films as *They Shoot Horses, Don't They?* (1969), *Klute* (1971), *Coming Home* (1978), and *The China Syndrome* (1979). She received Academy Awards for best actress for her performances in *Klute* and *Coming Home*. She costarred with her father in the film *On Golden Pond* (1981).

In the 1970s and '80s Fonda was active on behalf of left-wing political causes. She was an outspoken opponent of the Vietnam War who journeyed to Hanoi in 1972 to denounce the U.S. bombing campaigns there. In the 1980s she devised a popular exercise program for women while continuing to appear in motion pictures. She was married twice, to the French film director Roger Vadim and then to the American politician Tom Hayden.

fondant, confection of sugar, syrup, and water, and sometimes milk, cream, or butter, that is cooked and beaten so as to render the sugar crystals imperceptible to the tongue. The candy is characteristically glossy white in colour, velvety in texture, and plastic in consistency.

Usually, as a first step in making fondant, sugar, corn syrup, and invert sugar, or sugar broken down by heat and graining retardants, are dissolved in water. The resulting mass is heated and beaten or agitated vigorously to dissolve the sugar further.

Icings and confectionery centres made of fondant are predominantly sugar; the proportion of corn syrup is increased to make the chewier fondant used in coating bonbons.

Fondi, Latin *FUNDI*, town, Latina *provincia*, Lazio (Latium) *regione*, south-central Italy. It lies along the Appian Way at the foot of the Aurunci Mountains, northeast of Fondi Lake and 56 miles (90 km) southeast of Rome. Originally a town of the ancient Volsci people, it received Roman citizenship in 188 BC. The town became papal property in the 5th century, although this control remained largely nominal until the 17th century. Fondi was disputed between the papacy and the Kingdom of Naples in the later Middle Ages. In 1378 it was the scene of the conclave that elected Antipope Clement VII, giving rise to the Great Schism of the Western church (1378–1417).

Many of Fondi's notable buildings were damaged during World War II, including the Castello (13th–15th century), the Palazzo del Principe (1466–77), the medieval Church of San Pietro, and the late Gothic Church of San Domenico (containing a cell used by St. Thomas Aquinas). Roman antiquities in the town include the remains of a temple beneath San Pietro's and the town's ancient cyclopean walls, which are partly of polygonal masonry (late 3rd or early 2nd century BC) and partly of rubble masonry (1st century BC).

Fondi is an agricultural centre noted for citrus fruits, being the northernmost point in Italy where they are regularly cultivated. Pop. (1988 est.) mun., 30,649.

fondue neuchâtelaise, Swiss national dish of melted Emmentaler and Gruyère cheeses. In its preparation, white wine is heated in a heavy casserole, called a *caquelon*, that has been rubbed with garlic. The grated cheese is added to the hot wine along with a little cornstarch and a flavouring of nutmeg or kirsch. The fondue is eaten communally from its pot. Diners are provided with small cubes of crusty bread, which they spear on long-handled forks and dip into the hot mixture. The crust that remains at the bottom of the pot is divided among the diners.

There is a legend that the dish originated in the 16th century during fighting between the Protestant and Roman Catholic Swiss. The factions declared a truce after the day's battle and shared a similar dish, one side providing the bread and the other the cheese.

Fonseca, Gulf of, Spanish GOLFO DE FONSECA, sheltered inlet of the Pacific Ocean, bounded northwest by El Salvador, northeast by Honduras, and southeast by Nicaragua. Discovered in 1522, it reaches inland for approximately 40 miles (65 km) and covers an area of about 700 square miles (1,800 square km). Its entrance, marked by Cape Amapala in El Salvador and Cape Cosigüina in Nicaragua,

is about 20 miles (32 km) across, but widens to approximately 50 miles (80 km). The gulf is fed by the Goascorán, Choluteca, and Negro rivers of Honduras and the Estero Real River of Nicaragua. The gulf's shores are covered with mangrove swamps, except in the west, where Conchagua Volcano in El Salvador rises sharply from the shore. Notable among the islands in the gulf are Zacate Grande, El Tigre, and Meanguera. The main ports are La Unión in El Salvador, Amapala on Isla del Tigre in Honduras, and Puerto Morazán (upstream on the Estero Real) in Nicaragua.

Fonseca, Manuel Deodoro da (b. Aug. 5, 1827, Alagôas, Braz.—d. Aug. 23, 1892, Rio de Janeiro), leader of the coup that toppled Emperor Pedro II. He became the first president of the Brazilian republic.

The son of an army officer, Fonseca was trained for a military career. He distinguished himself in the Paraguayan War (1864–70) and rose to the rank of major. Although he was politically conservative and personally loyal to the emperor, he felt that it was his duty as an officer to protest the despotic acts of the government and insist that his fellow officers had a right to express their political views.

Manuel da Fonseca, portrait by A. Leterre

By courtesy of the Arquivo Nacional do Brasil

Declared insubordinate by Pedro II, Fonseca led the military revolt of Nov. 15, 1889, which established Brazil as a republic. He served as provisional president until February 1891, when he was elected president by the constituent assembly, a body largely controlled by the generals. As president, Fonseca was both arbitrary and ineffective. When he attempted to rule by decree, he was forced to resign in November 1891.

Font-de-Gaume, cave known for its lavish prehistoric wall paintings, located in the Beune valley near Les Eyzies, in Dordogne, Fr. The cave, with its high, narrow main gallery and several side passages, contains about 200 engraved and painted figures, including bison, horses, mammoths, reindeer, aurochs, woolly rhinoceros, a wolf, and a lioness.

The animals were painted in monochrome and in polychrome, usually in shades of red, brown, and black, and were often superimposed on earlier pictures, making it possible to discern a chronological sequence of artistic development. Most of the paintings probably date to the early and middle Magdalenian period, though some may be as much as 10,000 years older.

Fontaine, Hippolyte (b. 1833, Dijon, Fr.—d. 1917, Paris), French engineer who discovered that a dynamo can be operated in reverse as an electric motor; he was also the first to transmit electric energy (1873).

After completing his education at the École Nationale Supérieure des Arts et Métiers

at Châlons-sur-Marne, he travelled around France making models of new inventions. He then became an industrial designer and by 1857 had become chief of design in a factory. During the Franco-German War of 1870–71, he organized the manufacture of cannons. After discovering the reversibility of the dynamo, he constructed an electric motor based on that principle, then used the motor in the first transmission of electricity at Vienne in 1873. While serving as president of the Société Internationale des Electriciens, he founded the *Revue Industrielle*, a learned journal.

Fontaine, Jean de La (poet): see La Fontaine, Jean de.

Fontainebleau, town, northern France, in the Seine-et-Marne *département*, Île-de-France region, 40 mi (65 km) south-southeast of Paris by road, situated in the forest of Fontainebleau, 2 mi from the left bank of the Seine. The famous château, southeast of the town, is one of the largest residences built by the kings of France. Originally a medieval royal hunting lodge enlarged by Louis IX, or St. Louis (1214–70), it was entirely rebuilt by the best French architects of the time in 1527; only one tower of the earlier building still stands. Famed craftsmen, including the Italian painter Francesco Primaticcio and the Italian sculptor Benvenuto Cellini, were called to the court to further embellish the palace; these artists, collectively referred to as the School of Fontainebleau, blended Italian and French styles. Henry II (reigned 1547–59), Catherine de Médicis (1519–89), and Henry IV (reigned 1589–1610) enlarged the palace. The spacious gardens were redesigned by André Le Nôtre, the 17th-century French landscape architect, during the reign of Louis XIV. The château is a succession of five courtyards of different shapes. The Gallery of Francis I (reigned 1515–47), the horseshoe exterior staircase, the ballroom, and the council chamber are of par-

France. It covers 42,000 ac (17,000 ha); nearly a quarter of it is rocky. Pop. (1982) 14,687.

Fontainebleau, school of, the vast number of artists, both foreign and French, whose works are associated with the court of Francis I at Fontainebleau during the last two-thirds of the 16th century. There is both a first and

"Diana the Huntress," oil painting by an anonymous artist of the school of Fontainebleau, c. 1550; in the Louvre, Paris
Graudon—Art Resource/EB Inc

a second school of Fontainebleau. The earlier works are the more important.

The palace itself can be described as charming and picturesque, though architecturally it is not a work of consequence, being chiefly a transformation of the previous medieval castle, even incorporating some of the older parts. The King began rebuilding in 1528 and by 1530

lerie François I, the Chambre de la Duchesse d'Etampes, and the Salle de Ball.

Primaticcio was active long after the death of Rosso, and his manner of representing the human figure with long limbs, thin necks, small heads, and exaggerated classical profiles was canon for the rest of the century. Other foreign masters included the painter of mythological landscapes, Niccolò dell'Abbate, who was at Fontainebleau from 1552, and Benvenuto Cellini, Florentine goldsmith and sculptor, who is well known for his salt-cellar made for Francis I (1540; Kunsthistorisches Museum, Vienna) and "Nymph of Fontainebleau" (1543/44; Louvre, Paris).

The so-called second school of Fontainebleau generally refers to the painters Ambroise Dubois (1563–1614), Toussaint Dubreuil (1561–1602), and Martin Fréminet (1567–1619), men who, though competent, lacked imagination and invention and were content to work within the artistic boundaries set by their predecessors at Fontainebleau.

Fontana, Carlo (b. 1634/38, Bruciate, near Como, Milan—d. 1714, Rome), Italian architect, engineer, and publisher whose prolific studio produced widely imitated designs for fountains, palaces, tombs, and altars, as well as the curved facade on the S. Marcello al Corso (1682–83). His many international students included M.D. Poppelmann of Germany, James Gibbs of England, Filippa Juvarra of Italy, Johann Lucas von Hildebrandt and Fischer von Erlach of Austria, and others.

Fontana worked for Gian Lorenzo Bernini on Sta. Maria dei Miracoli (1662–79) and finished Bernini's Palazzo di Montecitorio (1650–94) (formerly the Palazzo Ludovisi), which had been started for the family of Innocent X. Fontana's students continued the Bernini tradition into the 18th century.

Fontana's other works are the church of S. Biagio in Campitelli (reassembled on Piazza Capizucchi; before 1665), SS. Apostoli (1702–08), the Casanatense Library (1708), the Cappella Sistina of Sta. Maria Maggiore, Cappella Ginetti in S. Andrea della Valle (1671), the Cappella Cibo in Sta. Maria del Popolo (1683–87), the Baptismal Chapel in St. Peter's (1692–98), and the Cappella Albani in S. Sebastiano (1705). His tombs include those of Queen Christina of Sweden in St. Peter's (1702), Clement XI, and Innocent XII. His largest ecclesiastical ensemble was the Jesuit church and college at Loyola, Spain (1681–

The château of Fontainebleau, Fr., with the "Horseshoe" staircase entrance (centre)

ticular interest. The château is surrounded by pleasant gardens crossed by a canal built in the reign of Henry IV.

Fontainebleau was little more than a hamlet until the 19th century, when it became a popular resort for Parisian holidaymakers. Three historical documents signed at the château were the revocation of the Edict of Nantes by Louis XIV (1685); the concordat between France and Rome (1814); and (in the same year) Napoleon's act of abdication. During World War II the palace of Fontainebleau was a German headquarters. Liberated in 1944 by U.S. Gen. George Patton, it was the seat of a Western Allied headquarters from 1945 to 1965. The national forest of Fontainebleau is one of the most scenic wooded tracts in

had persuaded Rosso Fiorentino (1494–1540), the first of many Italians who were to work there, to locate in France. Rosso was joined in 1532 by Primaticcio (1504–70). Artists of great merit, they evolved a brilliant system of combining painted panels with stucco nudes, garlands, and other forms sculpted in high relief. In addition, Rosso developed a much imitated "strapwork" technique; that is, he treated stucco like pieces of leather that had been rolled, folded, and cut into shape. Artists who could not visit Fontainebleau knew of the work there through engravings, and these same engravings are useful today as records of what has been lost. Much of the most characteristic Fontainebleau decorative sculpture and painting can still be seen there in the Ga-

Church of S. Marcello, Rome, by Carlo Fontana, c. 1683

Anderson—Ainari from Art Resource/EB Inc

1738), which influenced Spanish, Austrian, and south German architects.

After he was appointed surveyor of St. Peter's, he published the *Templum Vaticanum*, with its many engravings (1694). Twenty-seven volumes of his manuscripts and drawings are now in the Royal Library at Windsor.

Fontana, Domenico (b. 1543, Melide, Milan—d. 1607, Naples), Italian architect who worked on St. Peter's Basilica and other famous buildings of Rome and Naples.

Fontana went to Rome in 1563, where he was employed by Cardinal Montalto (later Pope Sixtus V) to design a chapel in the church of Sta. Maria Maggiore (1585). When Cardinal Montalto was elected pope, he appointed Fontana as architect to the papacy.

Fontana designed the Vatican Library (1587–90), the Acqua Felice (1587), and the present Lateran palace, built on the ruins of the old medieval palace. He collaborated with Giacomo della Porta on the completion of St. Peter's dome (1588–90) from Michelangelo's model. His most famous undertaking was the removal of the Egyptian obelisk (brought to Rome in the 1st century AD) from its place in the circus of the Vatican and its erect-

The Lateran Palace, Piazza San Giovanni in Laterano, Rome, by Domenico Fontana, 1586–88
Anderson—Alinari from Art Resource/EB Inc.

tion in front of St. Peter's (1586). Accused of misappropriating public money, Fontana was dismissed from his post in 1592 by Pope Clement VIII. He then became Royal Engineer at Naples to the count of Miranda (1592) and built the Palazzo Reale (1600–02).

Despite his association with a number of important projects, Fontana is not considered a great architect; his fame largely rests on his commission as architect to Sixtus V.

Fontana, Lavinia (b. 1552, Bologna, Papal States—d. Aug. 11, 1614, Rome), Italian painter of the Mannerist school, one of the first women to execute large, publicly commissioned figure paintings.

She studied with her father, Prospero Fontana (c. 1512–97), a minor painter of the school of Bologna, and Lavinia Fontana herself became one of the most important portraitists in Bologna during the late 16th century. Her works were admired for the beauty of their colour and the detail of the clothes and jewelry that her subjects wore. The subjects of Fontana's paintings are religious, and some of her most famous works are large altarpieces executed for the churches of her native city and, later, for those of Rome, where she went in 1603. She married the painter Gian Paolo Zappi, who was willing to subordinate his career to her own. She enjoyed the patronage of the family of Pope Gregory XIII and painted the likenesses of many eminent people.

Fontana's largest work was a painting of "The Stoning of St. Stephen," which she undertook as an altarpiece for S. Paolo Fuori le Mura (St. Paul's Outside the Walls) in Rome, a basilica that was destroyed in the fire of 1823. Her "Visit of the Queen of Sheba" (National Gallery, Dublin) is her most ambitious surviving narrative work. She was elected a member of the Roman Academy, a rare honour for a woman.

Fontane, Theodor (b. Dec. 30, 1819, Neuruppin, Brandenburg—d. Sept. 20, 1898, Ber-

lin), writer who is considered the first master of modern Realistic fiction in Germany.

He began his literary career in 1848 as a journalist, serving for several years in England as correspondent for two Prussian newspapers. From this position he wrote several books on English life, including *Ein Sommer in London* (1854; "A Summer in London") and *Jenseits des Tweed* (1860; "Beyond the Tweed"). From 1860 to 1870 he wrote for the conservative newspaper *Kreuzzeitung*, and between 1862 and 1882 he published a four-volume account of his travels in the March of Brandenburg. He combined historical and anecdotal material with descriptions of the Prussian landscape and the seats of historic families. He also wrote popular ballads, *Männer und Helden* (1850; "Men and Heroes") and *Bal-laden* (1861; "Ballads"), stirring celebrations of heroic and dramatic events, some drawn from Prussian history.

Fontane produced his best work after he became the drama critic for the liberal newspaper *Vossische Zeitung* and was freed from the earlier conservative restraint. Turning to the novel late in life, he wrote, at the age of 56, *Vor dem Sturm* (1878; "Before the Storm"), considered to be a masterpiece in the genre of the historical novel. He portrayed the Prussian nobility both critically and sympathetically. His aim was, as he said, "the undistorted reflection of the life we lead." In several of his novels Fontane also dealt with the problem of women's position in society; *Frau Jenny Treibel* (1893) and *Effi Briest* (1898) are among his best. *Effi Briest*, in particular, is known for its superb characterization and the skillful portrayal of the milieu of Fontane's native Brandenburg. His other major works are *Der Stechlin* (1899), which is noted for its charming style, and *Schach von Wuthenow* (1883), in which he portrays the weaknesses of the Prussian upper class.

fontanel, also spelled FONTANELLE, soft spot in the skull of an infant, covered with tough, fibrous membrane. There are six such spots at the junctions of the cranial bones; they allow for molding of the fetal head during passage through the birth canal. Those at the sides of the head are irregularly shaped and located at the unions of the sphenoid and mastoid bones with the parietal bone. The posterior fontanel is triangular and lies at the apex of the occipital bone. The largest fontanel, the anterior, is at the crown between the halves of the frontal and the parietals. It is diamond shaped and about 2.5 centimetres by 4 centimetres (about 1 by 1.5 inches). The lateral fontanels close within three months of birth, the posterior fontanel at about two months, and the anterior fontanel by two years.

Bony fish, some amphibians, and other mammals also have fontanels during embryonic and infant stages.

Fontanes, Louis, marquis de (b. March 6, 1757, Niort, Fr.—d. March 17, 1821, Paris), French man of letters who represented Catholic and conservative opinion during the First Empire and was appointed grand master of the University of Paris by Napoleon.

As a young man, Fontanes lived in Paris and associated with the important literary figures of the time. When the Revolution came, he at first enthusiastically supported it, expressing his sentiments in *Poème séculaire, ou chant pour la Fédération du 14 Juillet* (1790) and editing a newspaper, *Moderateur*, in Lyon. Eventually, however, the excesses of the Revolution disgusted him; and after he courageously protested the atrocities of the Terror in Lyon to the National Convention in December 1793, he was forced to go into hiding. But in 1795, after the establishment of the Directory, he was appointed professor of literature at the École Centrale des Quatre-Nations and was one of the first members of the Institut National, in which he opposed

antireligious views. Forced to leave Paris by the Directory because of his journalistic activities in 1797, he spent two years in London, where he became a friend of one of the founders of French Romanticism, the royalist Chateaubriand.

Returning to France in 1799, Fontanes founded the political and literary journal *Mercure de France*. A member of the legislative body from 1802, Fontanes served as its president from 1804 to 1808. Napoleon appointed him grand master of the University of Paris in 1808; and despite the Emperor's plans to reorganize it along secular and military lines, Fontanes endeavoured to maintain its traditions and its religious identity. After Napoleon's abdication in 1814, Fontanes supported Louis XVIII and was a member of the commission appointed to draft the Charte Constitutionnelle, Louis's constitution. In 1817 he was created a marquis.

Fontanne, Lynn: see Lunt, Alfred; and Fontanne, Lynn.

Fontenelle, Bernard Le Bovier, sieur de (sire of) (b. Feb. 11, 1657, Rouen, Fr.—d. Jan. 9, 1757, Paris), French scientist and man of letters, described by Voltaire as the most universal mind produced by the era of Louis XIV. Many of the characteristic ideas of the Enlightenment are found in embryonic form in his works.

Fontenelle was educated at the Jesuit college in Rouen. He did not settle in Paris until he

Fontenelle, detail of an oil painting by L. Galloche, 1723; in the Musée National de Versailles et des Trianons, France
Musée des Muses Nationaux

had passed the age of 30 and had become famous as the writer of operatic librettos. His literary activity during the years 1683–88 won him a great reputation. The *Lettres galantes* (1683, "Gallant Letters"; expanded edition, 1685) contributed to this, but the *Nouveaux Dialogues des morts* (1683, "New Dialogues of the Dead"; 2nd part, 1684) enjoyed a greater success and is more interesting to a modern reader. The *Dialogues*, conversations modelled on the dialogues of Lucian, between such figures as Socrates and Montaigne, Seneca and Scarron, served to disseminate new philosophical ideas. The popularization of philosophy was carried further by the *Histoire des oracles* (1687; "History of the Oracles"), based on a Latin treatise by the Dutch writer Anton van Dale (1683). Here Fontenelle subjected pagan religions to criticisms that the reader would inevitably see as applicable to Christianity as well. The same antireligious bias is seen in his amusing satire *Relation de l'île de Bornéo* (1686; "Account of the Island of Borneo"), in which a civil war in Borneo is used to symbolize the dissensions between Catholics (Rome) and Calvinists (Geneva).

Fontenelle's most famous work was the *Entretiens sur la pluralité des mondes* (1686; *A Plurality of Worlds*, 1688). These charming and sophisticated dialogues were more influ-

ential than any other work in securing acceptance of the Copernican system, still far from commanding universal support in 1686. Fontenelle's basis of scientific documentation was meagre, and some of his figures were wildly erroneous even for his own day. He was unfortunate in the moment of his publication: the Cartesian theory of vortices, on which his work was based, was refuted the next year in Isaac Newton's *Principia*. But the *Entretiens* were nevertheless exceedingly successful. Fontenelle was elected to the Académie Française in 1691 and was elected to the Académie des Inscriptions in 1701.

As permanent secretary of the Académie des Sciences from 1697, Fontenelle held a highly influential office. He published the memoirs presented to the academy and wrote its history. He kept abreast of new developments in science, corresponding with scientists in most European countries, and developed his talent for lucid popular exposition, notably in some of his obituary notices read to the academy (e.g., those of Newton and Gottfried Wilhelm Leibniz).

Fontenelle was a close friend of Montesquieu and well known to Voltaire, who mocked him in his *Micromégas* (1752), a dissertation on the smallness of man in relation to the cosmos. Fontenelle's most original contribution was in his approach to historiography, shown in his *De l'origine des fables* (1724; "Of the Origin of Fables"), in which he supports the theory that similar fables arise independently in several cultures and also tentatively addresses himself to comparative religion.

Fontenoy, Battle of (May 11, 1745), confrontation that led to the French conquest of Flanders during the War of the Austrian Succession. It was the most famous victory of the French marshal Maurice, Count de Saxe.

The battle was fought 5 miles (8 km) southeast of Tournai (in modern Belgium), between 52,000 French troops under de Saxe and about 50,000 Allied troops (composed of English, Hanoverian, Dutch, and Austrian units) under William Augustus, Duke of Cumberland, son of King George II of England. Cumberland was marching to relieve Tournai, which the French had besieged. De Saxe prepared to meet the Allied attack from a strong defensive position, which included hastily constructed redoubts. The Allied attack was a direct frontal push, with the Dutch and Austrians attacking the French right and the British and Hanoverians striking the well-prepared left. After initial attacks failed, Cumberland sent 15,000 infantry against the French left. When these troops halted to dress ranks, there occurred a celebrated incident in which Lord Charles Hay, of the Allied forces, dashed forward from the lines, drank a toast, and, according to a doubtful story related by Voltaire, invited the French to fire first. After entering the French camp in this first assault, the British retreated to reform and advance once again. Finally, the French artillery, cavalry counterattacks, and the charge of the Irish Brigade (in the French service) against the British right forced the massive Anglo-Hanoverian infantry formation to retreat with about 50 percent losses. Dutch losses in the other sector were also heavy. Total French losses were about 7,500. Cumberland retreated toward Brussels, and de Saxe followed the victory by taking Tournai and most of Flanders during the next four months.

Fontevault-l'Abbaye, also spelled FONTEVRAUD, village near Saumur, Maine-et-Loire département, Pays de la Loire région, France. It lies near the confluence of the Vienne and Loire rivers and is surrounded by fields and woods.

Fontevault-l'Abbaye is the site of the great

abbey of Notre-Dame de Fontevault, which, housing both monks and nuns, was founded in 1099 or 1101 by the Breton hermit Robert

The abbey kitchen (left) and church at Fontevault-l'Abbaye, Fr.

Bruno Barbey—Magnum

d'Abrissel; it was a triple monastery with five separate buildings. The abbey church and three of the monastery's buildings are still standing.

The order of Fontevault was inspired by the Benedictine Rule, but the abbess was in complete control. The nuns came mostly from the highest families; and in the 12th century there were three dependent houses belonging to the order in England, several in Spain, and about 100 elsewhere in France.

In 1792 the abbey was suppressed as a religious community. Under Napoleon the buildings were turned into a prison, which was closed down only in 1963, when restoration work was undertaken.

The abbey church and other buildings, including a 12th-century double octagonal kitchen and 16th-century cloisters, are open to the public. In the abbey church, recumbent statues mark the burial places of Henry II of England; his wife, Eleanor of Aquitaine; and their son Richard I the Lion-Heart. Pop. (1982) 964.

Fonteyn, Dame Margot, original name MARGARET HOOKHAM, married name DAME MARGOT FONTEYN DE ARIAS (b. May 18, 1919, Reigate, Surrey, Eng.—d. Feb. 21, 1991, Panama City, Panama), outstanding ballerina of the English stage.

As a child she studied dance in Hong Kong and then in London with Serafima Astafieva and at the Sadler's Wells Ballet school. Her debut was with the Vic-Wells Ballet in 1934. When Markova left the company the following year, Fonteyn took over many of her classical roles, including *Giselle*, and became a leading danseuse of the Vic-Wells Ballet. In 1939 she danced Aurora in a revival of *The Sleeping Beauty*; her interpretation is still considered the definitive Aurora of the era.

Apart from the classical repertoire, she created many roles in such ballets by Frederick Ashton as *Horoscope*, *Symphonic Variations*, *Daphnis and Chloë*, and *Ondine* (considered by many her greatest creation) and gave outstanding performances in revivals of Fokine's *Firebird* and *Petrushka*. Other ballets associated with her career are Kenneth MacMillan's *Romeo and Juliet* (1965) and John Cranko's *Poème de l'estate* (1970) and, with the Soviet expatriate Rudolf Nureyev as partner, *Swan Lake*, *Raymonda*, *Le Corsaire pas de deux*, and other classics in addition to new ballets created especially for them. Her musicality,

technical perfection, and precisely conceived and executed characterizations made her an international star, the first developed by an English school and company.

After 1959 she appeared with the Royal Ballet as guest artist and also toured extensively. Her celebrated partnership with Nureyev began in the early 1960s and is generally considered to have enriched her characterizations. In 1955 she married Roberto Emilio Arias, former Panamanian ambassador to Great Britain. She became president of the Royal Academy of Dancing in 1954 and was created Dame of the Order of the British Empire in 1956. In the late 1970s, as she began to curtail her performing, she turned to television presentations and to the writing of such books as *Margot Fonteyn: Autobiography* (1975), *A Dancer's*

Margot Fonteyn in *Ondine*
London Express

World (1979), and *The Magic of Dance* (1979). She remained active in the world of dance until her death.

Fontina, semihard cow's-milk cheese that originated in the Valle d'Aosta region of northern Italy. Made in wheels 13 to 15 inches (33 to 38 cm) in diameter and 3 to 4 inches (about 8 to 10 cm) thick, Fontina has a tough, beige natural rind, sometimes coated in wax, and a pale gold interior with a few small holes. The characteristic flavour of Fontina is mild but distinctively nutty and savoury. Fontinas from Sweden, Denmark, and the United States have milder flavour, softer texture, and more holes than those of Italy.

The European Economic Community protects the designation Fontina; similar cheeses that are produced outside Valle d'Aosta but within the Common Market are generally known as *fontal*.

Fonvizin, Denis Ivanovich (b. April 3 [April 14, New Style], 1744/45, Moscow, Russia—d. Dec. 1 [Dec. 12], 1792, St. Petersburg), playwright who satirized the cultural pretensions and privileged coarseness of the nobility; he is considered his nation's foremost 18th-century dramatist.

Educated at the University of Moscow, he worked as a government translator until 1769. His wit and his knowledge of French and German classics made him a favourite in the enlightened circles of the court of Catherine the Great. In 1769 he became secretary to the liberal count Nikita Ivanovich Panin, an advocate of constitutionalism. His first important comedy, *Brigadir* (written 1766–69, published 1783; "Brigadier"), ridiculed the contemporary fashion of aping French manners and speech—or rather of aping them incorrectly. His masterpiece, *Nedorosl* (published 1783;

"The Minor"), is considered the first truly Russian drama. It deals with a gentry family so ignorant and brutish that they survive only through the industry of their ill-treated serfs. The plot centres on the tyrannical mother's attempts to educate her spoiled and loutish son for the civil service and to marry him to an heiress. The characters are portrayed with a realism unknown at the time, and the play is still performed. In 1783 Fonvizin sharply criticized the Russian aristocracy in a tract on political reform and fell out of favour with Catherine. Thereafter, his works were banned, and his last years were spent in travel.

Foochow (China): *see* Fu-chou.

food, material consisting essentially of protein, carbohydrate, and fat used in the body of an organism to sustain growth, repair, and vital processes and to furnish energy.

Food is treated in a number of articles in the MACROPAEDIA. For a description of the processes of absorption and utilization of food, *see* Nutrition. For information on the methods used to prepare raw foods for cooking, consumption, or storage, *see* Food Processing. For the art of selecting, preparing, and serving fine foods or foods traditional to a region or population, *see* Gastronomy.

For a description of the place of food in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part Three, Division III.

Food and Agriculture Organization (FAO), oldest permanent specialized agency of the United Nations, established at the end of World War II with the objective of eliminating hunger and improving nutrition. The FAO seeks to coordinate the efforts of governments and technical agencies in programs for developing agriculture, forestry, and fisheries.

The FAO carries on research; provides technical assistance on a project basis to individual countries; operates an educational program through seminars and training centres; maintains statistics on world production, trade, and consumption of agricultural commodities; and publishes a number of periodicals, yearbooks, and research bulletins.

The permanent headquarters of the FAO are in Rome, with other offices throughout the world. The organization is governed by the biennial FAO conference, in which each member country is represented. The conference elects a council consisting of representatives of member governments.

An Indicative World Plan for Agricultural Development was issued in 1969, analyzing the main problems in world agriculture and suggesting strategies for their solution. From the 1960s on, the FAO concentrated on programs for the development of high-yield strains of grain, the elimination of protein deficiencies, the provision of rural employment, and the promotion of agricultural exports.

Food and Drug Administration (FDA), agency of the U.S. federal government authorized by Congress to inspect, test, approve, and set safety standards for foods and food additives, drugs, chemicals, cosmetics, and household and medical devices. First known as the Food, Drug, and Insecticide Administration when it was formed as a separate law enforcement agency in 1927, the FDA derives the greater part of its regulatory power from four laws: the Federal Food, Drug, and Cosmetic Act, which established safety and purity standards and provided for factory inspection and for legal remedy; the Fair Packaging and Labeling Act, which required honest, informative, and standardized labeling of products; the Radiation Control for Health and Safety Act, which was designed to protect consumers from possible excess radiation generated by X-ray machines, televisions, microwave ovens, and the like; and the Public Health Service

Act, which gave the FDA authority over vaccines and serums and justified the agency's programs for milk sanitation and the inspection of restaurants and travel facilities.

Generally, the FDA is empowered to prevent untested products from being sold and to take legal action to halt sale of undoubtedly harmful products or of products which involve a health or safety risk. Through court procedure, the FDA can seize products and prosecute the persons or firms responsible for legal violation. FDA authority is limited to interstate commerce. The agency cannot control prices nor directly regulate advertising except of prescription drugs and medical devices.

food chain, in ecology, the sequence of transfers of matter and energy from organism to organism in the form of food. Food chains intertwine locally into a food web because most organisms consume more than one type of animal or plant. Plants, which convert solar energy to food by photosynthesis, are the primary food source. In a predator chain, a plant-eating animal is eaten by a larger animal. In a parasite chain, a smaller organism consumes part of a larger host and may itself be parasitized by even smaller organisms. In a saprophytic chain, microorganisms live on dead organic matter.

Because energy, in the form of heat, is lost at each step, or trophic level (*q.v.*), chains do not normally encompass more than four or five trophic levels. In overpopulated areas people commonly increase the total food supply by cutting out one step in the food chain: instead of consuming animals that eat cereal grains, the people themselves consume the grains. Because the food chain is made shorter, the total amount of energy available to the final consumers is increased.

food colouring, any of numerous dyes, pigments, or other additives used to enhance the appearance of fresh and processed foods. Colouring ingredients include natural colours, derived primarily from vegetable sources and sometimes called vegetable dyes; inorganic pigments; combinations of organic and metallic compounds (called lakes); and synthetic coal-tar substances. They are added to orange and potato skins, sausage casings, baked goods, candies, carbonated drinks, gelatin desserts, powdered drink mixes, and many other foods. Many of these additives are also employed as colouring agents in cosmetics, drugs, and products such as toothpaste and mouthwash.

In the United States the nature and purity of the dyes used in food colouring first became the subject of legislation in 1906. In 1938 the Food, Drug, and Cosmetic Act was passed, giving food colouring additives numbers (*e.g.*, Amaranth was renamed FD&C Red No. 2) and requiring certification of each batch of colouring. Dyes again became the focus of controversy in the 1950s because the excessive use of certain dyes produced illness. While natural, or vegetable, colourings are generally considered safe, the potential hazards of artificial and synthetic colourings continue to be a subject of controversy. Modern testing methods demonstrated the toxic effects of some colour ingredients previously considered harmless. As a result, many countries have deleted these substances from their lists of approved additives. In the United States the Color Additives Amendments were passed in 1960. Among the colours that have been "delisted," or disallowed, in the United States are FD&C Orange No. 1; FD&C Red No. 32; FD&C Yellows No. 1, 2, 3, and 4; FD&C Violet No. 1; and FD&C Reds No. 2 and 4. Many countries with similar food colouring controls (including Canada and Great Britain) also ban the use of Red No. 40, and Yellow No. 5 is also undergoing testing.

food poisoning, also called (incorrectly) PTOMAINES POISONING, acute gastrointestinal

illness resulting from the consumption of foods containing one or more representatives of three main groups of harmful agents: natural poisons present in certain plants and animals, chemical poisons contaminating foods, and microorganisms (mainly bacteria) and their toxic secretions. In 1870 an Italian toxicologist, Francesco Selmi, coined the term ptomaine (from Greek *ptoma*, "corpse") poisoning, in reference to the foul smell associated with both putrefying food and decomposing corpses; the term is wholly unscientific because "ptomaines," formed by the action of bacteria on nitrogenous matter, are now known to be caused by several different kinds of organic bases, some harmless and some toxic.

The majority of cases of acute food poisoning are caused by bacteria (*see* salmonellosis) and their toxic products (*see* botulism).

Among the chemical poisons contaminating foods are certain heavy metals used in fungicides and insecticides (*see* mercury poisoning). Instances of metal poisoning may sometimes be traced to the serving or preparation of acidic fruits (*e.g.*, lemonade) in certain cookware or vessels (*see* antimony poisoning; cadmium poisoning). Various food additives and preservatives, though generally innocuous on a short-term basis, may exert a cumulative toxic effect when ingested over a long period.

The more common poisonous plants and animals that cause food poisoning in humans include certain varieties of mussels and clams (*see* shellfish poisoning); ocean and freshwater fish (*see* fish poisoning); fungi (*see* mushroom poisoning); plants (*e.g.*, water hemlock; rhubarb greens); and nuts (*e.g.*, akee nuts), seeds (*e.g.*, tung seeds), and beans (*e.g.*, *Vicia faba*).

food preservation, any of a number of methods by which food is kept from spoilage after harvest or slaughter.

A brief treatment of food preservation follows. For full treatment, *see* MACROPAEDIA: Food Processing.

The practice of preserving food can be traced to prehistory, when fruits and vegetables were dried, cereal grains were parched, and fish and game were salted and dried. These age-old methods developed very slowly and were purely empirical—fermentation, drying, smoking, and curing with salt being the principal techniques. As the biological causes of food spoilage became better understood, rapid advances followed, and appropriate methods were soon developed for dealing with the causative agents.

Since most foods either carry or eventually acquire bacteria, molds, or yeasts, microorganisms are the major cause of food spoilage. Other factors leading to deterioration or spoilage are the natural enzymes present in some foods and various chemical reactions, particularly oxidation. Some factors that lead to spoilage in one food are regarded as desirable in another instance and may be, indeed, essential for the protection of certain foods. For example, yeasts are applied in making wine, bacteria in the manufacture of sour milk and pickled products, and molds in cheese making. Enzymes are used in both cheese production and in brewing, and the browning of roasts and bread crust is a type of chemical reaction that in many other foods leads to deterioration and spoilage.

Among the major processes for food preservation are cooling or freezing, dehydration, canning, smoking, salting, candying, and the addition of chemical preservatives and inhibitors. Often several principles are applied in combination. For instance, cabbage is preserved as sauerkraut in the presence of salt and by the chemicals produced by the mi-

croorganisms during fermentation, and much of this product is later marketed in cans after heat sterilization. Some frozen food products are heated before freezing in order to deactivate the enzymes or to reduce the number of viable organisms present. A combination of dehydration and freezing is used in the process known as freeze-drying, whereby solid food remains frozen while its liquid escapes as a vapour.

The modern objective of food preservation includes concern for food quality, for economy, and, especially, for convenience in addition to the prevention of spoilage. Colour or appearance, flavour, texture or consistency, and nutritive value are the major quality factors. Most countries have detailed and exacting requirements governing food processing from the standpoint of sanitation and quality, but the extent to which such regulations are enforced varies greatly. Naturally, the emphasis given to quality factors depends somewhat on the level of economic development.

food processing, any of a variety of operations by which raw foodstuffs are made suitable for consumption, cooking, or storage.

A brief treatment of food processing follows. For full treatment, see MACROPAEDIA: Food Processing.

Food processing generally includes the basic preparation of foods, the alteration of a food product into another form (as in making preserves from fruit), and preservation and packaging techniques.

A number of food-processing innovations have even resulted in new products, such as concentrated fruit juices, freeze-dried coffee, and instant foods. Foods and food supplements have also been processed from such hitherto untapped sources as oilseeds (chiefly protein-rich soybeans and cottonseeds); mutant varieties of crops; leaves, grasses, and aquatic plants; and highly nutritious fish meal and concentrates.

food processor, electric appliance developed in the late 20th century, used for a variety of food-preparation functions including kneading, chopping, blending, and pulverizing.

The food processor was invented by Pierre Verdon, whose Le Magi-Mix, a compact household version of his own earlier restaurant-scaled Robot-Coupe, was first exhibited in Paris in 1971. Carl Sontheimer, an American engineer and inventor, refined Verdon's machines to produce the Cuisinart. The widespread success of the Cuisinart following its exhibition in Chicago in 1973 led a number of other manufacturers to design competing models, and hundreds of thousands of food processors were sold in the late 1970s.

Food processors are of two basic types: those in which most of the work is done in a single bowl by a flat blade, and those fitted with many attachments. Standard accessories include a work bowl, lid, chopping blade, mixing blade, and disks for slicing and shredding.

fool, also called JESTER, a comic entertainer whose madness or imbecility, real or pretended, made him a source of amusement and gave him license to abuse and poke fun at even the most exalted of his patrons. Professional fools flourished from the days of the Egyptian pharaohs until well into the 18th century, finding a place in societies as diverse as that of the Aztecs of Mexico and the courts of medieval Europe. Often deformed, dwarfed, or crippled, fools may have been kept for luck as well as for amusement, in the belief that deformity can avert the evil eye and that abusive raillery can transfer ill luck from the abused to the abuser. Fool figures played a part in the religious rituals of India and pre-Christian Europe, and, in some societies, such as that

of Ireland in the 7th century BC, they were regarded as being inspired with poetic and prophetic powers. The raillery of the fool and his frequent ritual association with a mock king suggest that he may have originated as a sacrificial scapegoat substituted for a royal victim. A resemblance between the sacrificial garments of ancient ritual and the costume of a household jester in the Middle Ages—coxcorn, eared hood, bells, and bauble, with a motley coat—has been noted.

The earliest record of the use of court fools dates from the 5th dynasty of Egypt, whose pharaohs attached great value to Pygmies brought from the mysterious lands to the south, apparently employing them as dancers and buffoons. Fools were a part of many wealthy households of imperial Rome, in which imbecility and deformity fetched high prices in the slave markets. References to household fools appear increasingly in records from the 12th through the 15th century. Fools were attached to courts, private households, taverns, and even brothels. In the 18th century, household jesters declined in western Europe but flourished in Russia, and offending courtiers were sometimes degraded to court jesters.

The figure of the fool has also been important in literature and drama. The clown-player in Shakespeare's dramatic company, Robert Armin, was interested in household fools and published a historical account of them in 1605. His knowledge may have influenced the playwright, who produced some of the best-known fools in literature: Touchstone in *As You Like It*; Feste in *Twelfth Night*, and the fool in *King Lear*. See also fool's literature.

Fools, Feast of, popular festival during the European Middle Ages, held on or about January 1, particularly in France, in which a mock bishop or pope was elected, ecclesiastical ritual was parodied, and low and high officials changed places. Such festivals were probably a Christian adaptation of the pagan festivities of the Saturnalia. By the 13th century these feasts had become a burlesque of Christian morality and worship. In spite of repeated prohibitions and penalties imposed by the Council of Basel in 1431, the feasts did not die out entirely until the 16th century.

fool's gold (mineral): see pyrite.

fool's literature, allegorical satires popular throughout Europe from the 15th to the 17th century, featuring the fool (*q.v.*), or jester, who

represented the weaknesses, vices, and grotesqueries of contemporary society. The first outstanding example of fool's literature was *Das Narrenschiff* (1494; "The Ship of Fools"), a long poem by the German Humanist and satirist Sebastian Brant, in which more than 100 fools are gathered on a ship bound for Narragonia, the fools' paradise. An unsparing, bitter, and sweeping satire, especially of the corruption in the Roman Catholic church, *Das Narrenschiff* was translated into Latin, Low German, Dutch, and French and adapted in English by Alexander Barclay (*The Ship of Fools of the Worlde*, 1509); it stimulated the development of hard, biting, moral satires that include Thomas Murner's poem *Narrenbeschwörung* (1512; "Exorcism of Fools") and Erasmus' *Encomium moriae* (1509; *In Praise of Folly*). *Ship of Fools* (1962), by Katherine Anne Porter, used Brant's title for an allegorical novel in which the German ship *Vera* is a microcosm of life.

foot, plural FEET, in anatomy, terminal part of the leg of a land vertebrate, on which the creature stands. In most two-footed and many four-footed animals it consists of all structures below the ankle joint: heel, arch, digits, and contained bones such as tarsals, metatarsals, and phalanges; in mammals that walk on their toes and hoofed mammals, it includes the terminal parts of one or more digits.

The major function of the foot in land vertebrates is locomotion. Three types of foot posture exist in mammals: (1) plantigrade, in which the surface of the whole foot touches the ground during locomotion (*e.g.*, human, baboon, bear), (2) digitigrade, in which only the phalanges (toes, fingers) touch the ground, while the ankle and wrist are elevated (*e.g.*, dog, cat), (3) unguligrade, in which only a hoof (the tip of one or two digits) touches the ground—a specialization of running animals (*e.g.*, horse, deer).

In primates the foot, like the hand, has flat nails protecting the tips of the digits, and the undersurface is marked by creases and friction-ridge patterns. In most primates the foot is adapted for grasping (*i.e.*, is prehensile), with the first digit set at an angle from the others. The foot may be used for manipulation in addition to its use in climbing, jumping, or walking.

The human foot is nonprehensile and is adapted for a form of bipedalism distinguished by the development of the stride—a long step, during which one leg is behind the vertical axis of the backbone—which allows great distances to be covered with a minimum expenditure of energy. The big toe converges with the others and is held in place by strong ligaments. Its phalanges and metatarsal bones are large and strong. Together, the tarsal and metatarsal bones of the foot form a longitudinal arch, which absorbs shock in walking; a transverse arch, across the metatarsals, also helps distribute weight. The heel bone helps support the longitudinal foot arch.

It is believed that in the evolutionary development of bipedalism, running preceded striding. *Australopithecus africanus*, who lived between two and five million years ago, had a fully modern foot and probably strode.

The term foot is also applied to organs of locomotion in invertebrates, *e.g.*, the muscular, creeping or burrowing organ of a mollusk and the limb of an arthropod.

foot, plural FEET, in measurement, any of numerous ancient and modern lineal measures (commonly 25 to 34 cm) based on the length of the human foot and used exclusively in English-speaking countries. In most countries and in all scientific applications, the foot, with its multiples and subdivisions, has been superseded by the metric unit, the metre. In a few countries the foot was retained but eventually (by 1893 in the United States) became defined in terms of the me-

"Ship of Fools," woodcut illustration by Albrecht Dürer from *Das Narrenschiff* by Sebastian Brant, 1494

By courtesy of the Bayerische Staatsbibliothek, Munich

tre. In the United States the definition of the foot as exactly 30.48 cm took effect in 1959.

foot, plural FEET, in verse, the smallest metrical unit of measurement. The prevailing kind and number of feet, revealed by scansion, determines the metre of a poem. In classical (or quantitative) verse, a foot, or metron, is a combination of two or more long and short syllables. A short syllable is known as an arsis, a long syllable as a thesis. There are 28 different feet in classical verse, ranging from the pyrrhic (two short syllables) to the dispondeo (four long syllables). The adaptation of classical metrics to the strongly accented Germanic languages, such as English, does not provide an entirely reliable standard of measurement. The terminology persists, however, a foot usually being defined as a group of one stressed (ˈ) and one or two unstressed (˘) syllables. An exception is the spondee, which consists of two stressed syllables; in English verse, this is usually two monosyllables, such as the phrase "He who." The commonest feet in English verse are the iamb, an unstressed followed by a stressed syllable, as in the word re|port; the trochee, a stressed followed by an unstressed syllable, as in the word dai|ly; the anapest, two unstressed syllables followed by a stressed syllable, as in ser|e|nade; and the dactyl, a stressed syllable followed by two unstressed syllables, as in mer|r|ly.

If a single line of the poem contains only one foot, it is called monometer; two feet, dimeter; three feet, trimeter; four feet, tetrameter; five feet, pentameter; six feet, hexameter; seven feet, heptameter; eight feet, octameter. More than six, however, is rare. The metre of a poem (e.g., iambic pentameter, dactylic hexameter) is the kind plus the number of feet in each line.

Foot, Michael (b. July 23, 1913, Plymouth, Devon, Eng.), leader of Britain's Labour Party from November 1980 to October 1983, an intellectual left-wing socialist.

A member of a strongly Liberal family (his father had been a member of Parliament), Foot attended Wadham College, Oxford, and then began a career as a newspaper editor and columnist (1937–74). The mass unemployment of the 1930s turned him to socialism; and from 1945 on, apart from a break between 1955 and 1960, he was a Labour member of Parliament. In 1974 he established himself as a leading member of Prime Minister Harold Wilson's Cabinet, first as secretary of state for employment (1974–76) and then as leader of the House of Commons (1976–79). From deputy leader of the Labour Party (1976–80) he rose to become the party's chief, defeating Denis Healey, the candidate of Labour's right wing, in 1980. This vote, as well as other leftward trends in the party, caused some right-wing Labourites to resign from the party and to found the Social Democratic Party. Following a disastrous showing in the June 1983 general election, Foot announced that he would not continue as party leader; Neil G. Kinnock succeeded him in October 1983.

For many years Foot was a pamphleteer and political writer fervently espousing the cause of nuclear disarmament. He wrote a number of books, including *Aneurin Bevan, a Biography*, 2 vol. (1962–73).

foot-and-mouth disease (FMD), also called HOOF-AND-MOUTH DISEASE, a highly contagious viral disease affecting practically all cloven-footed mammals, including cattle, sheep, goats, pigs, and wildlife such as bison, deer, antelope, reindeer, giraffe, and elephant. The horse is resistant to infection. FMD is characterized by fever and painful, fluid-filled blisters on the tongue, lips, other tissues of the mouth, muzzle or snout, teats, and feet. Laboratory tests are needed to confirm the diagno-

sis because several other diseases can produce similar lesions. Because of its rapid spread and impact on animal productivity, FMD is considered to be the most economically devastating livestock disease in the world. The disease is not a human health hazard.

There are seven major immunologically distinct serotypes of the foot-and-mouth virus. Each serotype includes a number of strains having different degrees of infectivity, virulence, and pathogenicity. Immunity to one serotype does not convey immunity to any of the others. The virus is spread primarily by contact between infected and susceptible animals. An infected animal releases the virus in all excretions and secretions, especially during the onset of clinical signs. People can carry the virus on their hands (particularly under fingernails), clothes, and shoes and in their respiratory tract. Farm equipment and vehicles also can spread the disease, and the wind can transport aerosols containing the virus for several kilometres. There is no evidence that insects are involved in transmission.

Eradication efforts must begin as soon as a diagnosis of FMD is made. The premises should be quarantined, and all infected and susceptible animals on the premises should be euthanatized and their carcasses buried or cremated. Although either method will destroy the virus, burying is preferred. Cremation rapidly reduces the mass of carcasses but consumes considerable fuel. Because the virus can survive weeks to months in the environment, buildings and equipment must be thoroughly cleaned and disinfected and the premises left uninhabited for several months. The availability of FMD vaccine banks enables rapid production of vaccines based on strains identified in a particular outbreak. Vaccination can help control outbreaks, but vaccinated animals cannot be distinguished from infected animals by laboratory tests, which precludes proving that the disease has been eradicated.

FMD is endemic in many regions of Asia, Africa, the Middle and Far East, and South America. In the modern world, increased mobility of animals and people and increased density of animal populations are important factors in promoting the spread of FMD. North America has remained largely free of the disease owing to a rigorous surveillance system; the last major outbreak in the United States was in 1929. In early 2001, a major outbreak occurred in the United Kingdom, followed shortly by outbreaks in The Netherlands and France. In response, the United States temporarily banned importation of all ruminants and swine and their products from the 15-nation European Union. Cooked and cured meats were not included because heating and processing kills the virus. The last major outbreak in the United Kingdom prior to this had been in 1967.

football, any of a number of related games, all of which are characterized by two persons or teams attempting to kick, carry, throw, or otherwise propel a ball toward an opponent's goal. In some of these games, only kicking is allowed; in others, kicking has become less important than other means of propulsion. All modern football sports evolved from medieval folk football games, which were violent and typically contested by the inhabitants of rival villages. However, modern football derives more directly from games played in schoolyards of Great Britain and elsewhere.

For an explanation of contemporary football sports, see association football (soccer); football (in Canada and the United States); rugby football; Australian rules football; Gaelic football. For full treatment of football sports, see MACROPAEDIA: Sports, Major Team and Individual.

football (soccer): see association football.

football, in Canada, popular game that is played between two 12-member teams on a

rectangular field with goalposts at each end. It originated from English rugby, but changes in rules over the years have made it more closely resemble U.S. football.

A brief treatment of Canadian football follows. For full treatment, see MACROPAEDIA: Sports, Major Team and Individual.

Rugby was introduced to Canada in the 1860s. By 1883 two amateur leagues, the Ontario Rugby Football Union and the Quebec Rugby Football Union, were formed and became affiliated in 1891 with the reorganized Canadian Rugby Union. Intercollegiate competition started in 1898, and in 1909 Lord Earl Grey, then the governor-general of Canada, donated the now prestigious Grey Cup for the best amateur team. As Canadian and U.S. schools played each other, their styles grew more similar. By the early 1930s Frank ("Shag") Shaughnessy, the football coach at McGill University in Montreal, introduced several innovations, such as the forward pass and running interference, all of which established Canadian football in its present form.

A series of disputes prompted college teams to withdraw from Grey Cup competition in 1936, and thereafter professional teams dominated the sport. In 1956 the two existing professional leagues formed what became the Canadian Football League (CFL), and the amateurs were ruled out of Grey Cup play.

Canadian football differs in several ways from U.S. football. There are 12 players on a team instead of 11; the 12th member is used in the backfield on offense and as a linbacker or pass defender on defense. The other positions are the same, but the field and end zones are larger, and teams are allowed only three downs in which to advance the ball 10 yards. In addition, a punt or a kickoff that enters the end zone must be advanced beyond the goal line by the receiving team, or one point (a single, or rouge) is awarded to the kicking team. Offensive and defensive formations are similar, but they are designed more for a wide-open type of play, emphasizing the passing game. For a list of the winners of the Grey Cup, see Sporting Record: Football.

football, in the United States, popular game played between two 11-member teams on a rectangular field with goalposts at each end. Each team tries to score points by moving the oval ball over the opponent's goal line for a touchdown (by carrying or passing the ball to a teammate) or by kicking it between the goalposts. A team must advance the ball at least 10 yards in four attempts (called downs) to retain possession. Defensive and offensive teams alternate positions on the field as the possession of the ball changes from side to side.

A brief treatment of U.S. football follows. For full treatment, see MACROPAEDIA: Sports, Major Team and Individual.

U.S. football evolved in the 19th century as a combination of rugby and soccer. The first intercollegiate football match in the United States is usually credited to the game played in 1869 by Princeton University and Rutgers College at New Brunswick, N.J., but that game more resembled the kicking style of association football (soccer) than modern football; there were 25 players on a team, and the game was won by the number of goals scored rather than by touchdowns. In 1873 the first collegiate rules were standardized by Princeton, Yale, Columbia, and Rutgers, and soon afterward the distinct U.S. version of football began to develop.

The innovations of the sports authority Walter Camp were fundamental in the evolution of American football. In 1880 Camp substituted the scrimmage for the rugby scrum, initiated the dominant role of the quarterback, and reduced the number of players on a team

from 15 to 11. He introduced systems for scoring and measuring downs and yards gained. Tackling rules were also liberalized.

Although these steps were intended to make the game safer, the violence of play continued, and a series of deaths and injuries in 1905 prompted President Theodore Roosevelt to call for more changes. Rules were thus created that included the introduction of the forward pass, new formations, and the prohibition of blocking with extended arms. In 1910 the National Collegiate Athletic Association (NCAA) was formed to govern American intercollegiate competition. Postseason, or "bowl," games played between leading college teams became popular.

Professional football began in the 1890s, but it was not until the rise of television after World War II that it became one of the dominant American sports. In 1922 the American Professional Football Association was reorganized as the National Football League (NFL), which remains the main force of the professional game. A rival league, the American Football League (AFL), was created in 1959, but an agreement in 1966 led to the merger of the two in 1970 under the NFL title. The NFL is now divided into an American and a National conference; the winners of the conferences compete for the Super Bowl championship. See also *Sporting Record: Football*.

Football Association (FA), ruling body for English football (soccer), founded in 1863. The FA controls every aspect of the organized game, both amateur and professional, and is responsible for national competitions, including the Challenge Cup series that culminates in the traditional Cup Final at Wembley.

The FA helped organize Scottish, Welsh, and Irish associations in the late 1800s to supervise the game in those countries. It later joined the Fédération Internationale de Football Association (FIFA) to formulate rules of international competition.

By 2002 the FA represented about 40,000 clubs and more than 3,000,000 participants. Its activities included producing instructional materials for coaches, players, and referees, advising foreign football organizations, approving rules and regulations of English leagues, and serving as a court for those charged with having broken such rules. FA headquarters are in London.

Football League, British professional football (soccer) organization. The first such league was formed in England in 1888, largely through the efforts of William McGregor, known afterward as the "father of the league." Twelve of the strongest professional clubs of the time joined in the league, and the first season's championship was won by Preston North End. In 1892 a second division was formed and the first division increased to 16 clubs. Soon after, the league adopted the practice of promoting the first two clubs in the second division at the end of each season into the places of the last two clubs of the first division, which were relegated to the second division. A third division was added in 1920 and reorganized to form a fourth in 1958. The League Cup was introduced. Demand for greater television revenues led First Division clubs to break with the league and form the Premier League in 1992. The league includes more than 70 clubs. Its headquarters are in London.

The Football League's system of divisions with annual promotions and demotions was copied by other leagues throughout Europe.

Foote, Andrew (Hull), original name ANDREW HULL FOOT (b. Sept. 12, 1806, New Haven, Conn., U.S.—d. June 26, 1863, New York, N.Y.), American naval officer especial-

ly noted for his service during the American Civil War.

The son of a U.S. senator and Connecticut governor, Foote was appointed a midshipman in the U.S. Navy in 1822. He rose through the ranks, eventually commanding the *Perry* off the African coast. While in that command he was particularly zealous in apprehending slavers; his book, *Africa and the American Flag* (1854), is considered to have influenced public opinion away from traffic in slaves.

In August 1861, at the outset of the Civil War, Foote was put in charge of naval defense on the upper Mississippi River. He oversaw the outfitting of a flotilla that included three wooden paddleboats converted into gunboats and seven newly commissioned ironclad gunboats, as well as a number of smaller and partially armored gunboats. The following February, he and his command sailed on the Tennessee River to Fort Henry, which he captured easily on February 6, and then (February 12–16) down the Cumberland River to Fort Donelson. There the flotilla was heavily damaged, and Foote sustained injuries. He went on to help capture Island Number Ten (about 55 miles [88 km] below Cairo, Ill.), in the Mississippi, but his injuries and additional ailments soon forced him to relinquish all but nominal command. He was promoted to rear admiral on July 16. In June of the following year he was once again appointed to the command of a squadron of ships, this time near Charleston, but he died before he could take up the position.

Foote, Robert Bruce (b. 1834—d. 1912), British geologist and archaeologist, often considered to be the founder of the study of the prehistory of India.

At the age of 24, Foote joined the Indian geological survey, with which he remained for 33 years. After the archaeological survey was established in 1862, he began the first systematic research of human prehistoric remains in India, making the first discovery of hand axes in that country in 1863. Without the benefit of excavation but from surface remains and field observation only, he was able to make a fairly accurate reconstruction of Indian prehistory, naming the major cultural periods Paleolithic, Neolithic, and Iron Age after their European analogues. The Madras Museum, India, purchased his large collection of prehistoric objects in 1903. His *Catalogue Raisonné* (1914; "Classified List") and *Indian Prehistoric and Protohistoric Artefacts* (1916) summarized his years of research and contained his delineation of Indian prehistory.

Foote, Samuel (baptized Jan. 27, 1720, Truro, Cornwall, Eng.—d. Oct. 21, 1777, Dover, Kent), English actor, wit, and playwright whose gift for mimicry, often directed at his peers, made him a figure of both fear and delight on the London stage.

Foote attended Worcester College, Oxford, but left without taking a degree. In 1744, hav-

ing dissipated his inheritance, he turned to the theatre. His first efforts were not successful, but, while playing in the 2nd duke of Buckingham's *Rehearsal*, he demonstrated his ability as a mimic. In 1747 he presented a series of farcical entertainments called *Diversions of the Morning*, in which he ridiculed other actors and celebrities. Later, to avoid the restraints of the Licensing Act, which required patents for public performances, he styled his entertainments for his friends as "teas."

After 1753 Foote returned occasionally to the regular stage, but he was unsuccessful except in his own plays, which, like his "teas," depended on topical allusions and mimicry. Foote was adept in exploiting any event for his purposes, even his own misfortune. In 1766 he fell from a horse and broke his leg, which had to be amputated. Characteristically, he turned this to account by writing *The Devil Upon Two Sticks* and *The Lame Lover*. Another consequence of this misfortune was that the duke of York, who was responsible for the accident, secured for Foote a life patent, which permitted him to continue his performances without subterfuge.

Foote was undoubtedly a man of many talents, but he employed them only in savage attacks upon others. David Garrick, who frequently befriended him, avoided Foote's public ridicule only through flattery. Samuel Johnson, who considered Foote's wit "irresistible," was obliged to threaten physical chastisement. In 1777, however, Foote met his match. Agents of the notorious Elizabeth Chudleigh, duchess of Kingston, whom Foote had satirized in *A Trip to Calais* and *The Capuchin*, retaliated with such persistence that he was compelled to quit the stage.

footman moth, any of the insects belonging to the subfamily Lithosiinae of the tiger moth family Arctiidae (order Lepidoptera). The common name footman is probably derived from the stiff, elongate appearance of the adult moths, which usually align their narrow wings (span 2 to 5 cm [$\frac{1}{2}$ to 2 inches]) with the body as if standing at attention. Some species are colourful, although most are drab. The larvae of the footman moth have long, sparse hairs arising from wartlike tubercles; they feed on lichen.

Foppa, Vincenzo (b. 1427/30, Brescia, Republic of Venice [now in Italy]—d. 1515/16), Italian painter, leading figure in 15th-century Lombard art, and an artist of exceptional integrity and power.

His earliest dated work is a dramatic painting of the "Three Crosses" (1456). He spent the middle of his life in Pavia in the service of the dukes of Milan, and until the arrival of Leonardo da Vinci he was the most influential painter in the Lombard region. From 1480 he became receptive to the Renaissance style, influenced by Donato Bramante, Andrea Mantegna, and Leonardo da Vinci. This influence appears in the modeling and perspective of his best-known fresco, "The Martyrdom of St. Sebastian" (1485).

forage, vegetable food of wild or domestic animals. In agriculture, harvested, processed, and stored forage is called silage (*q.v.*).

foraminiferan, any unicellular organism of the rhizopodan order Foraminifera (formerly Foraminifera), characterized by long, fine pseudopodia that extend from a uniloculated or multinucleated cytoplasmic body encased within a test, or shell. Depending on the species, the test ranges in size from minute to more than 5 cm (2 inches) in diameter and varies in shape, number of chambers, chemical composition, and surface orientation. Tests of a South Pacific species are large enough to be used as jewelry by oceanic islanders; *Nummulite* specimens from the Eocene limestones of the Egyptian pyramids often exceed 5 cm in diameter. Foraminiferans inhabit

Samuel Foote, engraving by W. Greatbatch after Sir Joshua Reynolds
By courtesy of the Mander and Mitchenson Theatre Collection

virtually all marine waters and are found at almost all depths, wherever there is protection and suitable food (microscopic organisms).

An important constituent of the present-day planktonic (floating) and benthic (bottom dwelling) microfaunas, foraminiferans have an extensive fossil record that makes them useful as index fossils in geological dating and in petroleum exploration. The word foraminiferan does not refer to the external pores found in some species but to the foramina (openings or apertures) between adjacent chambers after a new chamber envelops a previous one. When the foraminiferans die, their empty calcareous tests sink and form the so-called foraminiferal ooze that covers about 30 percent of the ocean floor. Limestone and chalk are products of the foraminiferan bottom deposits.

The major factors governing the growth, reproduction, and distribution of foraminiferans are water temperature, depth, and salinity; availability of suitable food; nature of the substratum; and oxygen supply. The present-day foraminiferan population of the seas consists of six recognizably different faunas; four occur in warmer waters, two in colder waters.

Although some species of foraminiferans reproduce exclusively by asexual means (multiple fission, budding, fragmentation), for most species there is a regular or an occasional sexual generation. Reproduction usually occupies one to three days, depending on the size and complexity of the species. Small species may complete both the sexual and asexual generations within a month, but larger species often require a year or two. Reproduction normally terminates the life of the parent, since all its cytoplasm is generally devoted to formation of the young.

Forbach, town, Moselle *département*, Lorraine region, northeastern France, just southwest of Saarbrücken, Ger. The town, which has an important cokery and manufactures mining equipment, is at the edge of the Saar Coal Basin. Remains of the medieval castle of the counts of Forbach crown a nearby hill (Schlossberg). Forbach was the scene of a French defeat (Aug. 6, 1870) during the Franco-German War. Pop. (1999) 22,800.

Forberg, Friedrich Karl (b. Aug. 30, 1770, Meuselwitz, Saxe-Gotha—d. 1848, Hildburghausen, Saxe-Coburg), German philosopher and educator.

An exponent of the Idealist school developed by Johann Gottlieb Fichte, Forberg is best known for his essay *Über die Entwicklung des Begriffs Religion* (1798; "On the Development of the Concept of Religion"), a work that occasioned Fichte's dismissal from the University of Jena on the charge of atheism after he had published a corroborative treatise. Forberg also wrote further apologetical works in support of atheism.

Forbes, town, south central New South Wales, Australia, on the Lachlan River. Named after former New South Wales chief justice Sir Francis Forbes, it was proclaimed a town in 1861 during a gold rush and became a municipality in 1870. The bushranger (outlaw) Ben Hall was shot and killed there in 1865. Now a marketing centre in an irrigated wheat, fruit, vegetable, and livestock region, Forbes processes meats, flour, animal feed, and lumber and manufactures light engineering items. It has rail and road (Newell Highway) links to Sydney, which lies 180 mi (290 km) southeast. Pop. (1996) 7,467.

Forbes (of Culloden), Duncan (b. Nov. 10, 1685, near Inverness, Inverness-shire, Scot.—d. Dec. 10, 1747, Edinburgh), Scottish statesman whose loyalty to the Hanoverian king George II of Great Britain contributed markedly to the defeat of the Jacobite rebellion of 1745–46.

Trained in law, Forbes entered local poli-

Duncan Forbes, detail of a portrait after J. Davison, c. 1737; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

tics and in 1715 aided the Hanoverian cause during the unsuccessful Jacobite rebellion of that year. Forbes was elected to Parliament in 1722, and in 1737 he became lord president of the Court of Session. When Charles Edward, the Young Pretender, the Stuart claimant to the British throne, invaded Scotland in 1745, Forbes kept Inverness loyal to George II and persuaded the chiefs of two powerful clans—the Macdonalds and the Macleods—not to take the field for the Jacobites. From September 1745 until the suppression of the insurrection in April 1746, Forbes was the main representative of the government in northern Scotland. Nevertheless, he later fell into disfavour with the English for his efforts to mitigate the punishment of the rebels. Charles de Bois Murray's *Duncan Forbes of Culloden* was published in 1936.

Forbes, Edward (b. Feb. 12, 1815, Douglas, Isle of Man—d. Nov. 18, 1854, near Edinburgh), British naturalist, pioneer in the field of biogeography, who analyzed the distribution of plant and animal life of the British Isles as related to certain geological changes.

While a medical student at Edinburgh, Forbes embarked upon a botanical tour of Norway (1833). Drawn to natural science, he then began an extensive study of mollusks and starfishes, to which he devoted much of his life, participating in dredgings and expeditions in the Irish Sea (1834), France, Switzerland, Germany, Algeria (1836), Austria (1838), and the Mediterranean (1841–42). During this period, he pursued the study of life in the littoral zones (the ocean from the shore to the continental shelf) and developed an interest in the geographical distribution of animals.

After publication of his *History of British Starfishes* (1841), Forbes became curator at the Museum of the Geological Society of London (1842), professor of botany at King's College, London (1842), and paleontologist to the British Geological Survey (1844). In 1846 he published an important essay, "On the Connexion Between the Distribution of the Existing Fauna and Flora of the British Isles, and the Geological Changes Which Have Affected Their Area." In this work he divided the plants of Great Britain into five well-defined groups, maintaining that the majority of them, like terrestrial animals, had migrated to the islands over continuous land at three separate periods—before, during, and after the glacial epoch.

Forbes was appointed professor of natural history to the Royal School of Mines in 1851 and completed publication of his *History of British Mollusca* (4 vol.) the following year. He became the youngest man elected president of the Geological Society (1853) and, shortly before his death, was awarded the natural history chair at the University of Edinburgh.

Forbes, George William (b. May 12, 1869, Lyttelton, N.Z.—d. May 17, 1947, Cheviot), farmer and politician who served as prime minister of New Zealand during the depression years (1930–35).

Forbes held a seat in the House of Representatives for thirty-five years as member for Hurunui (1908–43). He began his political career as a member of the Liberal Party, and when that party declined he became in 1928 a leader of the newly created United Party. However, he stepped aside when the ailing 72-year-old former prime minister, Sir Joseph Ward, formed a government of the United Party with Labour support (1928). Forbes was minister of lands and agriculture but *de facto* head of the Cabinet until asked to form his own ministry in 1930.

At odds with the Labour Party, Forbes formed a coalition government with the Reform Party and went on to win a general election in 1931. As prime minister he maintained only the most conservative policies to combat the deepening depression, however. His government allowed widespread reductions of wages by employers, and his deflationary policies further contracted an already shrinking economy, thus swelling the ranks of the unemployed. Overwhelmingly defeated by the Labour Party in elections in 1935, he became leader of the opposition, helped to form the new National Party out of the then-moribund United Party, and resigned from leadership though reelected to his seat (1938).

Forbes, James David (b. April 20, 1809, Edinburgh—d. Dec. 31, 1868, Edinburgh), Scottish physicist noted for his research on heat conduction and glaciers.

Educated at the University of Edinburgh, Forbes became a professor there in 1833. Between 1836 and 1844 he published four series of "Researches on Heat" in which he described the polarization (alignment of waves to vibrate in a plane) of radiant infrared heat by the mineral tourmaline, by transmission through a bundle of thin mica plates, and by reflection from the surfaces of a pile of mica plates. In 1846 he began experiments on the temperature of the Earth at different depths and in different soils near Edinburgh. Later he investigated the laws of heat conduction in bars, and in his last piece of work reported that iron conducts heat less efficiently as its temperature rises. The Royal Society awarded him the Rumford Medal in 1838 and the Gold Medal in 1843 for his work on heat. He made several visits to Switzerland and Norway to study the movement of glaciers and to observe their internal structure.

Forbes-Robertson, Sir Johnston (b. Jan. 16, 1853, London—d. Nov. 6, 1937, St. Margaret's Bay, near Dover, Eng.), English actor

Forbes-Robertson, c. 1900

By courtesy of the Victoria and Albert Museum, London

who was considered the finest Hamlet of his time, noted for his elocution and ascetic features.

Educated at Charterhouse School, he studied art before turning to the theatre in 1874, when he first appeared on the London stage. He acted with the Bancrofts and John Hare, played opposite Mary Anderson in England

and the United States, and for some time was a leading member of Sir Henry Irving's company. His first outstanding success was in Sir Arthur Pinero's *Profligate* in 1889. In 1895 he took over the management of the Lyceum, with Mrs. Patrick Campbell as leading lady, giving memorable performances in *Romeo and Juliet*, *Hamlet*, and *Macbeth*, and also producing Maurice Maeterlinck's *Pelléas and Mélisande*, in which his Romantic style of acting was highly successful. In 1900 he married Gertrude Elliott, who became his leading lady, appearing with him in such plays as *The Light That Failed*, Shaw's *Caesar and Cleopatra*, and, one of his biggest successes, Jerome K. Jerome's *Passing of the Third Floor Back*. Forbes-Robertson was knighted in 1913 and retired in 1915. His daughter Jean Forbes-Robertson (1905–62) became a distinguished actress.

Forbes' disease, also called **CORI'S DISEASE**, or **GLYCOGENOSIS TYPE III**, rare hereditary disease in which the metabolic breakdown of glycogen to the simple sugar glucose is incomplete, allowing intermediate compounds to accumulate in the cells of the liver. Affected persons lack the enzyme amylo-1,6-glucosidase, one of several enzymes involved in glycogen breakdown. Children with the disease have enlarged livers (which usually become normal in size by puberty), are generally stunted in growth, have doll-like facial features, and experience muscular weakness. The disease is fairly mild but can cause frequent hypoglycemia (low blood sugar), producing severe convulsions that may lead to mental retardation. Forbes' disease is inherited as an autosomal recessive trait.

Forbidden City, the Imperial Palace complex within the Inner City of Peking, China. Surrounded by a wall 35 feet (11 m) high extending for 2½ miles (4 km) on each side, it contains hundreds of buildings, the principal ones of which served as the imperial palaces of the emperors of China from 1421 to 1911. The 9,000 rooms in the Forbidden City housed the entire imperial court. The Forbidden City was so-called because no commoner or foreigner was allowed to enter it without special permission from the court officials. Under the People's Republic of China after 1949, the palaces were converted into museums and opened to the public.

forbidden lines, in astronomical spectroscopy, bright emission lines in the spectra of certain nebulae (H II regions), not observed in the laboratory spectra of the same gases, because on Earth the gases cannot be rarefied sufficiently. The term forbidden is misleading; a more accurate description would be "highly improbable." The emissions result from electrons in long-lived orbits within the radiating atoms—*i.e.*, the transition from an upper energy level to a lower energy level that produces the emissions requires a long time to take place. As a result, emission lines corresponding to such atomic transitions are extremely weak compared with other lines. In the laboratory, moreover, an excited atom tends to strike another particle or the walls of the gas container before it emits a photon, thereby further reducing the possibility of observation. In an H II region in interstellar space, by contrast, the atom will remain undisturbed long enough to emit the photon. Another factor favouring forbidden radiation in an H II region is the transparency of the constituent ionized gases to visible light, which permits the photons given off through the entire depth of the nebula to contribute to the emission lines. *See also* nebula.

Forbin, Claude de (b. Aug. 6, 1656, Gardanne, Fr.—d. March 4, 1733, Saint-Marcel),

French naval officer notable for his daring exploits in Louis XIV's wars. These he recorded in his lively but not always objective *Mémoires*, first published in 1730.

Forbin, detail from an engraving by L. Pierron, 17th century
Giraudon—Art Resource/EB Inc

After becoming an experienced seaman, he went on a French mission to the king of Siam, whom he served as grand admiral for two years (1685–87). Returning to France as commandant of a frigate stationed at Dunkirk, Forbin was captured by the English but managed to escape. Early in the War of the Spanish Succession (1701–13) his squadron in the Adriatic cut the supply line of the imperial forces in Italy. Forbin was transferred to the northern squadron, where he played havoc with the Dutch Baltic convoy off the Dogger Bank in October 1706. He seized 22 English merchantmen and 2 men-of-war the following May and captured 34 ships of the Dutch Muscovy convoy in June. He resigned from the navy following his failure to carry out an expedition that was to transport James the Old Pretender, claimant to the English throne, to Scotland in 1708.

Forbush effect, in astronomy, an occasional decrease in the intensity of cosmic rays as observed on Earth, attributed to magnetic effects produced by solar flares, which are disturbances on the Sun. The effect was discovered in 1937 by the American physicist Scott E. Forbush. Its cause became clearer in 1960, when, while the unmanned U.S. space probe Pioneer 5 was in flight some 5,000,000 km (3,000,000 miles) from Earth, a solar flare occurred, followed by an observation on Earth of the Forbush effect. Data from the probe indicated that the cause of the Forbush effect is a thin, hot plasma (of highly ionized gas) emitted by the Sun and carrying with it a tongue or lobe of the Sun's magnetic field as far as Earth; this magnetic field tends to deflect away from Earth the electrically charged particles making up primary cosmic rays.

Forcados River, river, a major navigable channel of the Niger Delta, southern Nigeria. It leaves the main course of the Niger River about 20 miles (32 km) downstream from Aboh and flows through zones of freshwater swamps, mangrove swamps, and coastal sand ridges before completing its 123-mile (198-kilometre) westerly course to the Bight of Benin. Since about 1900 it has been the chief link for small ship traffic between the Niger River and the Gulf of Guinea.

Forcados and Burutu, respectively 15 and 20 miles (24 and 32 km) upstream from the Bight, are ports on the river; but much of the agricultural produce shipped down the Niger and the Forcados is instead exported from Warri, a Delta port connected to the river by the 25-mile- (40-kilometre-) long Warri River. Petroleum deposits were discovered offshore from Burutu in 1964, and crude oil was ex-

ported from a loading point at sea after 1965. In 1971 the disused port of Forcados was revived as an oil tanker terminal, connected by pipelines to the oilfields.

Although the Forcados River is used by considerable commercial traffic, oceangoing vessels have not been able to use its exit to the sea since 1939 because of accumulated silt. Rivercraft and larger vessels now cross to the sea by the Escravos River, an arm of the Niger immediately to the north that was enlarged (1961–64) to accommodate vessels of 22-foot (7-metre) draft.

force, in mechanics, any action that tends to maintain or alter the position of a body or to distort it. The concept of force is commonly explained in terms of Newton's three laws of motion set forth in his *Principia Mathematica* (1687). According to Newton's first principle, a body that is at rest or moving at a uniform rate in a straight line will remain in that state until some force is applied to it. The second law says that when an external force acts on a body, it produces an acceleration (change in velocity) of the body in the direction of the force. The magnitude of the acceleration is directly proportional to the magnitude of the external force and inversely proportional to the quantity of matter in the body. Newton's third law states that when one body exerts a force on another body, the second body exerts an equal force on the first body. This principle of action and reaction explains why a force tends to deform a body (*i.e.*, change its shape) whether or not it causes the body to move. The deformation of a body can usually be neglected when investigating its motion.

Because force has both magnitude and direction, it is a vector quantity and can be represented graphically as a directed line segment; that is, a line with a length equal to the magnitude of the force, to some scale, inclined at the proper angle, with an arrowhead at one end to indicate direction. The representation of forces by vectors implies that they are concentrated either at a single point or along a single line. This is, however, physically impossible. On a loaded component of a structure, for example, the applied force produces an internal force, or stress, that is distributed over the cross section of the component. The force of gravity is invariably distributed throughout the volume of a body. Nonetheless, when the equilibrium of a body is the primary consideration, it is generally valid as well as convenient to assume that the forces are concentrated at a single point. In the case of gravitational force, the total weight of a body may be assumed to be concentrated at its centre of gravity (*see* gravity, centre of).

Physicists use the newton, a unit of the International System (SI), for measuring force. A newton is the force needed to accelerate a body weighing one kilogram by one metre per second per second. The formula $F = ma$ is employed to calculate the number of newtons required to increase or decrease the velocity of a given body. In countries still using the English system of measurement, engineers commonly measure force in pounds. One pound of force imparts to a one-pound object an acceleration of 32.17 feet per second squared.

force, line of, in physics, path followed by an electric charge free to move in an electric field or a mass free to move in a gravitational field, or generally any appropriate test particle in a given force field. More abstractly, lines of force are lines in any such force field the tangent of which at any point gives the field direction at that point and the density of which gives the magnitude of the field. The concept of lines of force was introduced into physics in the 1830s by the English scientist Michael Faraday, who considered magnetic and electric effects in the region around a magnet or electric charge as a property of the region rather than an effect taking place at a distance from a cause.

The electric lines of force that represent the field of a positive electric charge in space consist of a family of straight lines radiating uniformly in all directions from the charge where they originate. A second positive charge placed in the field would travel radially away from the first charge.

In the case of a magnetic field, since no isolated unit pole has ever been discovered, the field lines are called lines of force only in the sense that a small magnet is forced to align itself in the direction of these field lines. An electric charge traveling along a magnetic field line undergoes no magnetic force.

force, moment of a: *see* torque.

Force Acts, in U.S. history, series of four acts passed by Republican Reconstruction supporters in the Congress between May 31, 1870, and March 1, 1875, to protect the constitutional rights guaranteed to blacks by the Fourteenth and Fifteenth Amendments.

The major provisions of the acts authorized federal authorities to enforce penalties upon anyone interfering with the registration, voting, officeholding, or jury service of blacks; provided for federal election supervisors; and empowered the president to use military forces to make summary arrests. Under the act of April 20, 1871, nine South Carolina counties were placed under martial law in October 1871. This act and earlier statutes resulted in more than 5,000 indictments and 1,250 convictions throughout the South. In subsequent Supreme Court decisions, various sections of the acts were declared unconstitutional.

forced labour, also called **SLAVE LABOUR**, labour performed involuntarily and under duress, usually by relatively large groups of people. Forced labour differs from slavery in that it involves not the ownership of one person by another but rather merely the forced exploitation of that person's labour.

Forced labour has existed in various forms throughout history, but it was a peculiarly prominent feature of the totalitarian regimes of Nazi Germany and the Soviet Union (especially during the rule of Joseph Stalin), in which it was used on a vast scale. Under these regimes, persons either suspected of opposition or considered racially or nationally unfit were summarily arrested and placed under long or indefinite terms of confinement in concentration camps, remote labour colonies, or industrial camps and forced to work, usually under harsh conditions.

The Nazi Party's rise to power in Germany during the 1930s was accompanied by the extensive use of concentration camps to confine classes of persons who were opposed to the regime or who were otherwise undesirable. The outbreak of World War II created a tremendous demand for labour in Germany, and the Nazi authorities turned to the concentration-camp population to augment the labour supply. By the end of 1944 some 2 million prisoners of war (mostly Russians and Ukrainians) and some 7.5 million civilian men, women, and children from every German-occupied nation of Europe had been put to work in German arms factories, chemical plants, mines, farms, and lumber operations. Although the earlier arrivals in Germany were "volunteers," the vast majority (from 1941 on) were rounded up by force, transported to Germany in boxcars, and put to work under appallingly harsh and degrading conditions. A large percentage of the slave labourers had died from disease, starvation, overwork, and mistreatment by the time the war ended. Many of those who had become unfit for further labour because of the harsh conditions were simply exterminated.

Forced labour was also extensively used by the early Soviet government. In 1923 the Soviet secret police established a concentration camp on Solovetski Island in the White Sea

in which political prisoners were first used extensively for forced labour. The secret police established many corrective labour camps in the northern Russian S.F.S.R. and in Siberia beginning in the late 1920s; and, as the number of those arrested in Stalin's great purges of the 1930s grew into the millions, a network of hundreds of labour camps grew up throughout the Soviet Union. The Soviet concentration-camp system became a gigantic organization for the exploitation of inmates through work. The inmates of the camps in the northern Soviet Union were used primarily in lumbering and fishing industries and on large-scale public-works projects, such as the construction of the White Sea-Baltic Sea canal. The inmates of the Siberian camps were used in lumbering and mining. The inmates of the Soviet labour camps were inadequately clothed for the severe Russian climate, and the standard rations of bread and soup were scarcely adequate to maintain life. It is variously estimated that from 5 million to 10 million persons died in the Soviet labour camp system from 1924 to 1953. (*See* Gulag.) The use of forced labour greatly diminished after the death of Joseph Stalin in 1953 and the subsequent de-Stalinization of Soviet society. Forced labour was also used by Japan during World War II, and by the communist government of China at times from the 1950s to the 1970s. The Khmer Rouge regime (1975-79) of Cambodia made a particularly widespread and brutal use of forced labour.

In 1957 the International Labour Organisation adopted a resolution that condemned the use of forced labour throughout the world. The convention was ratified by 91 member nations. Forced labour continues to be used by a few authoritarian and totalitarian governments on a relatively small scale.

Forchheimer, Philipp (b. Aug. 7, 1852, Vienna [Austria]—d. Oct. 2, 1933, Vienna), Austrian hydraulic engineer, one of the most significant contributors to the study of groundwater hydrology during the late 19th and early 20th centuries. He showed that many of the standard techniques of mathematical physics could be applied to problems of groundwater movement, establishing this subject on a firm scientific basis.

Forchheimer's chief contribution was the application of Laplace's equation to the phenomena of groundwater flow. Because the equation already had been thoroughly studied in relation to the phenomena of heat flow and fluid flow, a whole body of preexisting mathematical theory became available for the solution of problems of groundwater flow. *See also* Laplace's equation.

Forkenbeck, Max (imilian Franz August) von (b. Oct. 21, 1821, Münster, Westphalia [Germany]—d. May 26, 1892, Berlin, Ger.), prominent leader of the 19th-century German National Liberal Party.

Elected to the Prussian Chamber of Deputies in 1858, Forkenbeck subsequently helped found the left-liberal German Progressive Party (1861), which after 1862 spearheaded the continuing constitutional struggle over the state military budget with the Prussian prime minister—later to become German imperial chancellor—Otto von Bismarck. In 1866, however, Forkenbeck seceded from the Progressives to join the new National Liberal Party, and thereafter, along with most of his party colleagues, he increasingly accommodated himself to the political designs of Bismarck. After Bismarck's scuttling of the National Liberals in 1878, however, Forkenbeck joined with much of the party's left wing to form the secessionist Radical Liberal Party (1881)—a belated and ultimately futile attempt to salvage a compromised liberalism. As his national political career waned, he rose to prominence in the city government of Berlin, where, as chief burgomaster from

1878, he carried out a program of public services and improvements.

Ford, Edmund Brisco (b. April 23, 1901, Papcastle, Cumberland, Eng.—d. Jan. 22, 1988, Oxford, Oxfordshire), British geneticist who made substantial contributions to the genetics of natural selection and defined and developed the science of ecological genetics.

Ford joined the faculty at the University of Oxford in 1927; he was made professor of ecological genetics in 1963, becoming emeritus professor in 1969. He was the author of many works on genetics and zoology, including the important books *Mendelism and Evolution* (1931), *Ecological Genetics* (1964), and *Genetic Polymorphism* (1965). In collaboration with Julian Huxley (1923-26), he performed some of the earliest research on the genetic control of growth. Working with freshwater crustaceans, he found that genes control both the time of occurrence and the rate of physiological processes. By his quantitative studies of animal populations in nature and his genetic experiments in the laboratory, he identified conditions under which natural selection occurs. The techniques he developed, such as marking animal specimens and counting them later to estimate population change, became basic to the science of ecological genetics. His later works include *Genetics and Adaptation* (1976), *Understanding Genetics* (1979), and *Taking Genetics into the Countryside* (1981).

Ford, Ford Madox, original name **FORD HERMANN HUEFFER**, also called **FORD MADOX HUEFFER** (b. Dec. 17, 1873, Merton, Surrey, Eng.—d. June 26, 1939, Deauville, Fr.), English novelist, editor, and critic, an international influence in early 20th-century literature.

The son of a German music critic, Francis Hueffer, and a grandson of Ford Madox Brown, one of the Pre-Raphaelite painters, Ford grew up in a cultured, artistic environment. At 18 he wrote his first novel, *The Shifting of Fire* (1892). His acquaintance with Joseph Conrad in 1897 led to their collaboration in *The Inheritors* (1901) and *Romance* (1903). In 1908 he founded the *English Review*, publishing pieces by the foremost contemporary British authors and also by the then-unknown D.H. Lawrence, Wyndham Lewis, Ezra Pound, and H.M. Tomlinson. At the same time, Ford produced works of his own: a trilogy of historical novels about the ill-fated Catherine Howard and novels of contemporary life in which he experimented with technique and style. It was not until *The Good Soldier* (1915), considered by many to be his best work, that he matched an assured, controlled technique with powerful content. This work skillfully reveals the destructive effects of contradictory sexual and religious impulses upon a quartet of upper-middle-class characters.

Ford took part in World War I, in which he was gassed and shell-shocked. Afterward he changed his name from Hueffer to Ford and tried farming in Sussex and Left Bank life in Paris. While in Paris he edited the *Transatlantic Review* (1924), which published works by James Joyce and Ernest Hemingway.

In his long literary career Ford had fruitful contacts with most of the important writers of the day and is remembered for his generous encouragement of younger writers. Of more than 70 published works, those on which his reputation rests are *The Good Soldier* and the tetralogy *Parade's End* (1950; comprising *Some Do Not* [1924], *No More Parades* [1925], *A Man Could Stand Up* [1926], and *Last Post* [1928]).

Ford, Francis Xavier (b. Jan. 11, 1892, Brooklyn, N.Y., U.S.—d. Feb. 21, 1952, Canton, China), martyred American Roman Catholic missionary and bishop of Mei-hsien in Kwangtung province, China.

Ford was ordained in 1917 and went to China the next year in the first group of Maryknoll missionaries sent to that country. He founded the Maryknoll Seminary for Chinese Boys in Yang-chiang in 1921 and in 1922 established the first overseas convent for Maryknoll sisters. He became the first bishop of Mei-hsien (1935) and remained at his post during World War II, though surrounded by Japanese troops. Under the postwar communist government, he was arrested on espionage charges on Dec. 23, 1950. He was humiliated and forced to submit to public beatings en route to prison in Canton. His subsequent death in Canton was not known outside China until September 1952.

Ford, Gerald R., in full GERALD RUDOLPH FORD, JR., original name LESLIE LYNCH KING, JR. (b. July 14, 1913, Omaha, Neb., U.S.), 38th president of the United States (1974–77), who, as 40th vice president, succeeded to the presidency on the resignation of President Richard M. Nixon.

While Ford was still an infant, his parents were divorced, and his mother moved to Grand Rapids, Mich., where she married Gerald R. Ford, Sr., who adopted the boy and gave him his name. Ford was a football star at the University of Michigan and received his law degree from Yale University in 1941.

In 1948 he was elected to the U.S. House of Representatives as a Republican and was reelected successively thereafter, becoming

Gerald R. Ford
AP/Wide World Photos

House minority leader in 1965. After the resignation of Vice President Spiro T. Agnew, President Nixon, on Oct. 12, 1973, nominated Ford to fill the vacant vice-presidential post. He was sworn in on December 6, the first vice president to take office in the middle of an administration.

Ford's succession to the presidency on Aug. 9, 1974, after Nixon's resignation, marked the first time in U.S. history that the holder of the presidential office had not been elected either as president or as vice president. On September 8 Ford granted a full pardon to Nixon "for all offenses against the United States" that he might have committed while in office. The pardon effectively squelched any criminal prosecutions that Nixon might have been liable to in connection with the Watergate scandal. To counter a widespread negative reaction to the pardon, Ford voluntarily appeared before a subcommittee of the House of Representatives on October 17 to explain his reasoning—the first time an incumbent president had formally testified before a committee of Congress.

Ford's administration coped gradually but successfully with the high rate of infla-

tion inherited from the Nixon administration. Ford's relations with the Democratic-controlled Congress were perhaps typified by his more than 50 vetoes of legislation by the end of 1976; more than 40 were sustained.

In the final days of the Vietnam War in April 1975, Ford ordered an airlift of anti-communist Vietnamese refugees that totaled 237,000, most of whom were taken to the United States. A few weeks later, after the seizure by Cambodia of the American cargo ship *Mayaguez*, Ford declared the event an "act of piracy" and sent the Marines to seize the ship. Later that year two attempts were made on Ford's life.

In a close contest at the Republican convention in August 1976, Ford won his party's nomination, despite a serious challenge by Ronald Reagan. That fall he became the first incumbent president to agree to public debates with a challenger—Jimmy Carter, the Democratic nominee. Running substantially behind from the beginning of the campaign, Ford was defeated in the November election.

Ford, Henry (b. July 30, 1863, Wayne county, Mich., U.S.—d. April 7, 1947, Dearborn, Mich.), American industrialist who revolutionized factory production with his assembly-line methods.

A brief treatment of the life and works of Henry Ford follows. For a full treatment, see MACROPAEDIA: Ford, Henry.

The son of Irish immigrants, Ford dropped out of school and was employed at the age of 15 as a machinist's apprentice in Detroit. He intermittently returned to his father's farm, where he set up a small machine shop and sawmill. He then worked as chief engineer of the Edison Company in Detroit until 1899, when he and others formed the Detroit Automobile Company. He soon left this company to build racing cars. In 1903 he and his partners formed the Ford Motor Company (*q.v.*). The Model T appeared in 1908, and in 1913 Ford introduced the successful assembly-line method of production. In that year mass production enabled him to sell the Model T for as little as \$500, thus putting automobile ownership within the economic reach of a large segment of the middle class for the first time.

Ford's business philosophy was to reduce the unit cost of each car built and thereby increase the volume of sales. After ceasing production of the Model T in 1927, he produced the entirely new Model A (an earlier one had been introduced in 1902). In 1932 he introduced the V-8 engine. He opposed unionization, but in 1941 he signed the first union shop and dues checkoff contract in the automotive industry with the United Auto Workers.

Ford ran for the U.S. Senate but lost. He was the author, with Samuel Crowther, of *My Life and Work* (1922) and *Today and Tomorrow* (1926).

Ford, Henry, II (b. Sept. 4, 1917, Detroit, Mich., U.S.—d. Sept. 29, 1987, Detroit), American industrialist and head of Ford Motor Company for 34 years (1945–79). He is generally credited with reviving the firm.

In 1940 Ford left Yale University without graduating to join the firm founded by his grandfather, Henry Ford, and at the time run by his father, Edsel Ford. A year later he joined the U.S. Navy; but in 1943, following the unexpected death of his father, he was released from duty and became a Ford vice president. After what amounted to a crash course in industrial management, he succeeded to the presidency of the ailing company in 1945.

He promptly set about modernizing the Ford Motor Company and discharged the all-powerful personnel chief Harry Bennett, whose strong-arm union-busting tactics had earned the company a great deal of opprobrium. He brought in a group of talented systems analysts from the U.S. Air Force who became known as the "Whiz Kids," among

them Robert S. McNamara, later to become Ford's president. One of the cars introduced during Henry II's tenure, the Edsel, was a legendary failure, but two others, the Mustang and the Thunderbird, were immensely popular and are widely considered to be classics. By the mid-1950s Henry II had restored the company to financial health, and subsequently he greatly expanded Ford's operations in overseas markets.

Ford, John (baptized April 17, 1586, Ilsington, Devon, Eng.—d. 1639?), major English dramatist of the Caroline period, whose revenge tragedies are characterized by certain scenes of austere beauty, insight into human passions, and poetic diction of a high order.

In 1602 Ford was admitted to the Middle Temple (a training college for lawyers), and he remained there, except for a period of suspension (1606–08), until at least 1617. He published an elegy on the Earl of Devonshire and a prose pamphlet in 1606, and a few other minor nondramatic works have been attributed to him during this period. It is not certain that he wrote for the stage until his collaboration with Thomas Dekker and William Rowley on the play *The Witch of Edmonton* in 1621. He also collaborated with Dekker in *The Sun's Darling* (1624), perhaps also in *The Welsh Ambassador* (1623), and in three other plays, now lost, of about the same date. His hand has been seen in Thomas Middleton's and William Rowley's *Spanish Gypsy* (1623), John Fletcher's *Fair Maid of the Inn* (1626), and other plays of Francis Beaumont and Fletcher.

From about 1627 to 1638 Ford wrote plays by himself, mostly for private theatres, but the sequence of his eight extant plays cannot be precisely determined, and only two of them can be dated. His plays are: *The Broken Heart*; *The Lover's Melancholy* (1628); *'Tis Pity She's a Whore*; *Perkin Warbeck*; *The Queen*; *The Fancies*, *Chaste and Noble*; *Love's Sacrifice*; and *The Lady's Trial* (1638). There are a few contemporary references to Ford, but nothing is known of his personal life, and there is no certain record of him after 1639.

Ford's reputation, which has never been beyond controversy, rests mainly on the first four plays he wrote alone; of these, *'Tis Pity She's a Whore* is probably the best known. The story concerns the incestuous love of Giovanni and his sister Annabella. When she is found to be pregnant, she agrees to marry her suitor Soranzo; the lovers' secret is finally discovered, but Soranzo's plan for revenge is outpaced by Giovanni's murder of Annabella and then Soranzo, at the hands of those hired killers Giovanni himself finally dies. There is no sense in *'Tis Pity* that Ford is arguing a case for the brother and sister's unnatural union, but he does exhibit an eloquent sympathy for the lovers, who are set apart from others by their unlawful relationship, their consciousness of their sin, and their sensual and at times even arrogant acceptance of it.

The Broken Heart is characteristic of Ford's work in its depiction of a noble and virtuous heroine who is torn between her true love and an unhappy forced marriage, again with tragic consequences for all concerned. *Perkin Warbeck* is a historical play centring on the tragic fate of the deluded impostor of that name who claimed to be the Duke of York. *The Lover's Melancholy* is the best of Ford's other plays, all of which are tragicomedies.

Ford's austere powerful themes are blurred by subplots featuring minor characters and bad comedy, but his insight into character, his fine sense of drama, and the beauty of his blank verse show his independence from the worst faults of his time, when English playwriting had entered a temporary decline. He is still regarded as the only English tragedian of any importance during the reign of Charles I (1625–49).

Ford, John, original name SEAN ALOYSIUS O'FEENEY, or O'FEARNA (b. Feb. 1, 1895, Cape Elizabeth, Maine, U.S.—d. Aug. 31, 1973, Palm Desert, Calif.), American motion-picture director who was Hollywood's best-known director of westerns. He developed a distinctive directorial style characterized by effective cutting, an emphasis on action, colourful characterization, a sentimentalized vision of the past, and the skillful creation of mood.

In 1914 Ford joined his brother Francis in Hollywood, becoming a property man at the Universal Studios. He changed his name, became an assistant director, and was assigned to work on shorts and westerns.

Ford's first big success as a large-scale director was *The Iron Horse* (1924), the story of the first transcontinental railroad, a film that gave impetus to the growing popularity of the high-budget "big western." *The Informer* (1935) established Ford's critical reputation, and it, along with three later films—*The Grapes of Wrath* (1940), *How Green Was My Valley* (1941), and *The Quiet Man* (1952)—all won the Academy Award for best direction.

Although many of his outstanding films dealt with social themes, Ford was best known for westerns, such as *Stagecoach* (1939), *My Darling Clementine* (1946), *Wagonmaster* (1950), *Rio Grande* (1950), *The Searchers* (1956), *The Man Who Shot Liberty Valance* (1962), *How the West Was Won* (1962), and *Cheyenne Autumn* (1964).

BIBLIOGRAPHY. Andrew Sinclair, *John Ford* (1979, reissued 1984); and J.A. Place, *The Western Films of John Ford* (1973).

Ford Foundation, American philanthropic foundation, established in 1936 with gifts and bequests from Henry Ford and his son, Edsel. At the start of the 21st century its assets exceeded \$9,000,000,000. Its chief concerns have been international affairs (particularly population control and the alleviation of food shortages), communications (especially public television), humanities and the arts, and, in later years, resources and the environment.

Ford Motor Co., American automotive corporation founded in 1903 by Henry Ford and 11 associate investors. In 1919 the company was reincorporated, with Ford, his wife, Clara, and his son, Edsel, acquiring full ownership; they, their heirs, and the Ford Foundation (formed 1936) were sole stockholders until January 1956, when public sale of the common stock was first offered. Headquarters are in Dearborn, Mich.

Henry Ford built his first experimental car in a workshop behind his home in Detroit in 1896. After formation of the Ford Motor Company, the first Ford car was assembled at the Mack Avenue Plant in July 1903. The highly successful Model T, introduced in 1908, was so popular that Ford developed new mass-production methods in order to meet demand, establishing the industry's first U.S. branch assembly plant (in Kansas City, Mo.) and opening its first overseas production plant in Manchester, Eng., in 1911. In 1913 Ford introduced the world's first moving assembly line for cars. To improve labour productivity, in 1914 Ford introduced the \$5 wage for an 8-hour day (replacing \$2.34 for a 9-hour day).

The company's first international sales branch opened in Paris in 1908. By mid-1914 there were more than 500,000 Model Ts on the world's roads; by 1923 Ford was producing more than half of U.S. automotive vehicles; and by the end of the 1920s Ford had more than 20 assembly plants overseas in Europe, Latin America, Canada, Asia, South Africa, and Australia. The Ford had become the world's most familiar car. In 1927 the last Model T and the first new Model A were produced, followed in 1932 by the first Ford V-8. In 1922 Ford had acquired the Lincoln Motor Company (founded 1917), which would produce Ford's luxury Lincolns and Continentals.

In 1938 Ford introduced the medium-priced Mercury brand.

As early as 1906 Henry Ford had acquired 58.5 percent of the company's stock; and, when the other stockholders balked at the idea of building the giant (and expensive) River Rouge Plant in Dearborn, he bought them out, and his son, Edsel Ford (1893–1943), became president (1919). On Edsel's death, Henry Ford returned to the presidency, but in 1945 he turned it over to his grandson Henry Ford II, who reorganized the company's financial structure and recruited talented managers. The failed introduction of the Edsel model (1957–59) occurred amid these successes. Henry Ford II continued to guide the company as chief executive officer (1945–70) and chairman of the board (1960–80).

In the 1950s and '60s the Ford Motor Company began limited diversification, but by the 1990s it had refocused attention on its automotive concerns, trucks and tractors, financial services, and the acquisition of other automotive firms, including premium British brands Jaguar (1989–90) and Aston Martin (1993). Later acquisitions included the rental car company Hertz Corp. (1994), the automobile division of Volvo (1999), and the Land Rover brand of sport utility vehicles (2000). Ford also owned a significant share of the Mazda Motor Corp.

Forde, Francis Michael (b. July 18, 1890, Mitchell, Queensland, Australia—d. Jan. 28, 1983, Brisbane, Queensland), politician and, for a short time, prime minister of Australia (1945).

Active in state politics as a young man, Forde was a member of the Australian House of Representatives (1922–46) and deputy leader of the Australian Labor Party (1932–46). In the cabinet he served as minister for the army (1941–46), minister for defense (1946), and deputy prime minister to John Curtin (1941–45) and Joseph Benedict Chifley (1945–46). He also served as prime minister for six days, July 6–12, 1945 (the shortest term in Australia's history), after the death of Curtin. He was Australian high commissioner to Canada from 1946 to 1953.

fore-and-aft sail, one of the two basic types of sailing rig, the other being the square sail. The fore-and-aft sail, now usually triangular, is set completely aft of a mast or stay, parallel to the ship's keel, and takes the wind on either side. The mainsail always has a boom, pivoted on the mast. Historically, it represented an important advance over the ancient square sail; it first appeared in the Mediterranean as the lateen sail. Full-rigged ships carried both types of sail; modern sport sailing craft carry fore-and-aft sails exclusively because of their ready maneuverability and facility in tacking into the wind. *Compare* lateen sail; square sail.

fore-edge painting, technique of painting the edges of the leaves, or folios, of a book, employed in the European Middle Ages. Manuscript books with gold-tooled bindings often had the edges of their pages gilded with burnished gold. They were also frequently gilded with heated tools and were occasionally coloured. From 1650 onward a number of London binders practiced a new decorative method of fore-edge painting: floral scrolls or scenes were painted upon the fanned-out fore-edge of the leaves and concealed by a normal gilt edge when the book was closed; they became visible only when it was opened. This decorative device was continued in the 18th century, but by the late 19th century fore-edge painting began to wane in popularity.

forecasting, economic: *see* economic forecasting.

foreclosure, legal proceeding by which a mortgagor's rights to a mortgaged property

may be extinguished if the mortgagor (borrower) fails to live up to the obligations agreed to in the mortgage. The mortgagee (the lender) may then declare the entire debt due and owing and may seek to satisfy the debt by foreclosing on the property. Most foreclosures are brought in equity proceedings. Strict foreclosure, considered the harshest method, may be used if the debtor is totally insolvent and all the worth of the property is used to pay off the indebtedness. Foreclosure is commonly by a court-decreed sale of the mortgaged property to the highest bidder, who is often the mortgagee. The proceeds of the judicial sale are first used to pay the debt; the surplus, if any, is paid to other creditors with subordinate claims on the same property and then to the mortgagor. If the proceeds are insufficient to pay the debt, the debtor is responsible for paying whatever amount of the mortgage is still unpaid. Where a mortgage provides for it, a mortgagee may exercise "power of sale" without prior recourse to the courts.

Foreign Affairs, journal of international relations, published in New York City six times a year, one of the most prestigious periodicals of its kind in the world. It is the organ of the Council on Foreign Relations, by which it was founded in 1922, and is, informally, the voice of the U.S. foreign-policy establishment. It has a world reputation for its careful and probing analyses of political, economic, and social developments in the world scene. The contributors of these authoritative and scholarly articles are among the nation's most distinguished journalists, scholars, and statesmen. Ideas put forward tentatively in this journal often, if well received by the *Foreign Affairs* community, appear later as U.S. government policy or legislation; prospective policies that fail this test usually disappear.

foreign aid, an international transfer of capital, goods, or services for the benefit of other nations and their citizens. Official foreign aid is offered in two major forms: (1) capital transfers, in cash or kind, either as grants or loans, and (2) technical assistance and training, usually as grants in the form of human resources and technical equipment. The rationale of economic aid assumes that when a country reaches a stage of sustained economic growth, foreign aid can be reduced and cut off. Military assistance—in the form of either equipment or training advisers—has been an extremely important type of aid.

Foreign aid as an instrument of national policy dates from the 18th century, when Frederick the Great of Prussia subsidized certain allies to assure their military support and effectiveness. This practice continued intermittently in Europe during the 19th century.

In World War I the United States made substantial loans to its European allies that became, in effect, grants when the allies defaulted on their repayments at the outset of the Great Depression. Because of this experience, U.S. aid during World War II was offered in the form of "lend-lease": the United States provided its allies with essential equipment and supplies, and in return the allies equipped and supplied U.S. troops stationed abroad.

The establishment of the United Nations Relief and Rehabilitation Administration (UNRRA), which operated from 1943 to 1947, marked an important, although largely unwitting, transition from the older conception of aid as a subsidy to a new conception of foreign aid as an institutional element of policy. UNRRA demonstrated that rich nations, notably the United States, which supplied most of the funds, were beginning to view official international aid as an essential element of postwar reconstruction.

The economic and humanitarian motives

for promoting large-scale reconstruction after World War II were catalyzed by political considerations—the West's fear of Soviet expansion into western Europe. The first foreign-aid response was U.S. President Harry Truman's decision in March 1947 to provide military and economic aid to Greece and Turkey, which were faced by military aggression from Communist forces based in Yugoslavia. In June 1947 U.S. Secretary of State George Marshall proposed a European Recovery Program of aid to western Europe with a much heavier emphasis on economic reconstruction. During the four-year life of the "Marshall Plan," western Europe was provided with about \$12 billion in U.S. government aid. The Marshall Plan is generally considered to have achieved its twin goals of promoting European reconstruction and preventing the westward spread of Soviet power.

During the 1950s it became apparent in both the United States and the Soviet Union that direct conflict between the two powers was unlikely and that there would be a struggle for the allegiance of developing countries of the "Third World." Thus, the communist-bloc countries and the West competed for favours in developing nations.

As that rivalry clearly demonstrated, seldom (if ever) are the motives of donor nations straightforward or entirely altruistic. The extension of foreign aid is typically designed to provide some advantage—whether economic, political, military, or other—to the donor. In some cases, aid and development assistance have exploited and harmed the nations to which they have been offered.

One disadvantage of foreign aid is that the donor normally requires the recipient to buy the donor's products. This "tied" aid creates special problems for recipients because the prices of donors' goods may be higher than world market prices. In effect, this aid imposes hidden interest charges on the borrower.

Multilateral programs have grown steadily. The major agency is the International Bank for Reconstruction and Development (the World Bank), which began in 1946 as an independent specialized agency of the United Nations. There are also several regional development banks, each lending funds to developing countries in its region. The oldest and largest is the Inter-American Development Bank, founded in 1959, which lends to Latin-American countries. The African Development Bank, founded in 1964, has had relatively little success in attracting large amounts of capital. The Asian Development Bank, founded in 1965, has been more successful.

European countries have established two institutions for multilateral aid—the European Development Fund and the European Investment Bank. Both are organs of the European Community (EC).

The United Nations finances a number of economic-aid programs through grants awarded by specialized agencies, notably by UNESCO, the World Health Organization, and the Food and Agriculture Organization.

The work of economic development has been discovered to be far more difficult than the rebuilding of Europe because it requires the transformation of entire societies and not simply their reconstruction. This task, it is now recognized, is the work of generations.

From the standpoint of the donor countries, foreign aid has often been politically unrewarding. The governments of new nations, with their colonial heritage, are naturally suspicious of the motives of industrial nations and are concerned with demonstrating their independence. The donor government may find itself tied to the fortunes of its client, often at considerable financial, military, and political cost. Aid-receiving nations naturally

attempt to pursue what they perceive to be their own interests, which may conflict with the interests of the donor countries.

The frequent inability of foreign aid to stimulate rapid economic development in poor countries has led to considerable skepticism in parliaments and among the populations of the donor countries as to the economic merits of foreign aid. Economic aid is manifestly only one element in the complex of factors required to bring about economic development.

foreign exchange: see international exchange.

Foreign Legion, French LÉGIION ÉTRANGÈRE, a military corps consisting originally of foreign volunteers in the pay of France but now including large numbers of Frenchmen. Its officers are nearly all from the French army, and a foreign-born legionnaire becomes eligible for French citizenship after serving one enlistment (five years) with good conduct. Upon enlistment the recruit takes an oath to serve not France but the legion, and the organization's unofficial motto, "*Legio patria nostra*" ("The legion is our fatherland"), further tells the legionnaire where his first loyalty lies. Often romanticized by novelists (as by Percival Christopher Wren in *Beau Geste* [1925]), who pictured the legion as a haven for criminals, forlorn lovers, and unhappy

Free French forces. In 1961 one regiment of the legion supported insurgents in Algeria against the French government and, despite its outstanding combat record, was disbanded in disgrace. In 1962, with the coming of Algerian independence, the legion for the first time moved its headquarters to metropolitan France, to the town of Aubagne, near Marseille. The Legion publishes a monthly magazine, *Kepi Blanc* ("White Kepi").

BIBLIOGRAPHY. James Wellard, *The French Foreign Legion* (1974); Hugh McLeave, *The Damned Die Hard: The Story of the French Foreign Legion* (1974); Tony Geraghty, *March or Die: A New History of the French Foreign Legion* (1987); and Douglas Porch, *The French Foreign Legion: A Complete History of the Legendary Fighting Force* (1991).

foreign service, also called DIPLOMATIC SERVICE, the field force of a foreign office, comprising diplomatic and consular personnel engaged in representing the home government's interests abroad and providing the necessary information on which foreign policy is based. There is a marked similarity in the foreign service organizations of most countries. Diplomatic and consular functions are generally performed by a single service, which is expected to serve at home or abroad, enabling interchangeability of consular and diplomatic officers. The merger of the two functions came

The Foreign Legion on the march in Algeria before 1914
H Roger-Viollet

noblemen serving under assumed names, the organization is actually a highly disciplined professional army that has been in almost continuous combat since its founding by law on March 9, 1831. Because the legion keeps secret a volunteer's past, it has had more than its share of the aforementioned types, but the man who wears the traditional white kepi headdress is more likely to be a European professional soldier who prefers fighting with the legion to garrison duty with his own army. Every major European war since the 1830s has swelled the legion's ranks with volunteers from unmustered forces. (After the Falklands War of 1982, British recruits rose to 10 percent of the total.)

Founded by King Louis-Philippe as an aid to controlling French colonial possessions in Africa, the legion established its headquarters at Sidi bel Abbès, Algeria. During its history its forces have fought or been stationed in such places as Spain, the Crimea, Italy, Mexico (where it supported the ill-fated emperor Maximilian), Dahomey (now Benin), Morocco, Syria, and Indochina. Although formerly prohibited from being stationed in metropolitan France during peacetime, it did serve there in World Wars I and II. After the French collapse in World War II, units of the legion escaped to join General Charles de Gaulle's

about when many European countries, beginning with France in 1880, recognized that the consular service, although less dependent on ceremony and prestige, could not be entirely separated from diplomatic affairs.

Originally, diplomatic officials were members of royal or noble families and served as the personal representatives of sovereign rulers. When governmental authority came to reside in institutions other than monarchs, diplomats became the representatives of the government in power. As such, they were for a long time drawn primarily from wealthy governing and aristocratic classes. Prior to World War I, candidates for the British diplomatic service, for example, had to show that they had an independent income. In the United States, despite the absence of an aristocracy or governing class, wealth and political connections were once important prerequisites because of low salaries and meagre representation (entertainment) allowances. In France under the Third Republic, the diplomatic service remained largely in the hands of prosperous upper-middle-class citizens and those members of the aristocracy whose wealth remained intact. In imperial Germany and Russia the diplomatic services were almost exclusively in the hands of the aristocracy and high reserve officers of the army and navy.

Great Britain in 1871 instituted the first competitive entrance examinations for the foreign service. In the 20th century, education and intellectual ability became the chief criteria of selection in most countries. The competitive entrance examination, merit system of advancement, and mandatory retirement at specified ages through a rigorous "selection up or selection out" procedure have been widely instituted.

Foreign service officers adhere to rules and customs that are of long standing and have proved indispensable to governments in conducting their international relations. Under international law and usage, personnel in missions abroad (usually embassies, legations, and consulates), including members of their households, are immune from the jurisdiction of the government to which they are accredited, and the mission itself has the status of extraterritoriality and, as such, is considered legally a part of the home country. Personnel may not be sued in civil action or compelled to testify as witnesses or compelled to pay taxes to the host country. Their official position does not sanction the evasion of private debts, however, and their private property is subject to local municipal law. An officer or staff member who does not conform to local regulations or who is otherwise unacceptable to the government to which he is accredited may be declared unacceptable (*persona non grata*) and his recall requested, a demand that is invariably obeyed. Accreditation of ambassadors or other chiefs of mission is handled in accordance with internationally accepted procedures, but appointment of both ambassadors and other officers follows the constitutional practice of individual states. See also diplomacy.

Forel, Auguste-Henri (b. Sept. 1, 1848, La-Gracieuse, near Morges, Switz.—d. July 27, 1931, Yvorne), Swiss neuroanatomist, psychiatrist, and entomologist known for his investigations of brain structure.

Forel studied medicine at the University of Zürich from 1866 to 1871 and then did work in neuroanatomy at the University of Vienna, where he received his medical degree in 1872. In 1879 he was appointed director of the Burghölzli Asylum in Zürich and professor of psychiatry at the University of Zürich. His first major contribution to the anatomy of the brain was his paper (1877) on the tegmental region, which described various previously unknown brain structures. In 1887 he published one of his most important works, on the neuron theory, describing those cellular functional units within the brain. In 1889 he founded an institute at Zürich for the medical treatment of alcoholism, and throughout his career he worked for social reforms to prevent such causes of mental illness as syphilis and alcoholism. Forel retired in 1893 and devoted the remainder of his life to social reform and the study of the psychology of ants.

Forel, François-Alphonse (b. Feb. 2, 1841, Morges, Switz.—d. Aug. 7, 1912, Morges), Swiss physician, scientist, and founder of limnology, the study of lakes.

While lecturing in physiology and anatomy at the University of Lausanne, Switz., Forel began his investigations of lakes, notably Lake Geneva, and he published his findings in *Le Léman: Monographie limnologique*, 3 vol. (1892–1904). His standard work on limnology, *Handbuch der Seenkunde* (1901), included a study of the hitherto unexplained movement of lake waters known as seiches. Forel is credited with the discovery of density currents, which occur in the Alpine lakes because of the cold temperatures of entering glacier-derived streams. He also explained the mechanism of seiches and studied earthquakes and glaciers.

Foreman, George (b. Jan. 10, 1949, Marshall, Texas, U.S.), American boxer who twice

was the world heavyweight champion (1973–74, 1994–95). When Foreman regained the heavyweight title at the age of 45, he became the oldest world heavyweight champion ever.

Foreman was reared in Houston, Texas, and learned to box in a U.S. Job Corps camp in Oregon. In the Olympic Games in Mexico City in 1968 he won the gold medal in the heavyweight boxing competition. The 6-foot 3-inch, 218-pound Foreman first captured the professional heavyweight belt by knocking out Joe Frazier in two rounds at Kingston, Jamaica, on Jan. 22, 1973. He had won all 40 of his professional bouts, including a sequence of 24 consecutive knockouts, until he fell to Muhammad Ali in eight rounds at Kinshasa, Zaire, on Oct. 30, 1974. He retired from the ring in 1977 and became an evangelist. Foreman resumed professional boxing in 1987 at the age of 39 and found immediate success and celebrity in a heavyweight division that was lacking quality fighters. Despite his age and more than 30 additional pounds, Foreman remained a devastating puncher and captured the world heavyweight title for the second time by knocking out Michael Moorer in 10 rounds at Las Vegas, Nev., on Nov. 5, 1994. He resigned his title the following year, on June 28, 1995.

forensic medicine, the science that deals with the application of medical knowledge to legal questions.

The use of medical testimony in law cases predates by more than 1,000 years the first systematic presentation of the subject by the Italian Fortunatus Fidelis in 1598. Forensic medicine was recognized as a specialty early in the 19th century.

The primary tool of forensic medicine has always been the autopsy (*q.v.*). Frequently used for identification of the dead, autopsies may also be conducted to determine the cause of death. In cases of death caused by a weapon, for example, the forensic pathologist—by examining the wound—can often provide detailed information about the type of weapon used as well as important contextual information. (In a death by gunshot, for example, he can determine with reasonable accuracy the range and angle of fire.) Forensic medicine is a major factor in the identification of victims of disaster, such as landslide or plane crash. In cause-of-death determinations, forensic pathologists can also significantly affect the outcome of trials dealing with insurance and inheritance.

In the 19th century, two other forensic specialties arose, namely, forensic psychiatry (which is used to determine the mental health of an individual about to stand trial, and, thus, his blameworthiness) and forensic toxicology. The forensic toxicologist gives evidence on such topics as intentional poisonings and drug use. The toxicologist has played an increasingly important role in matters of industrial and environmental poisoning.

Fores, also spelled FOREST (French region); see Forez.

foreshortening, method of rendering a specific object or figure in a picture in depth. The artist records, in varying degrees, the distortion that is seen by the eye when an object or figure is viewed at a distance or at an unusual angle.

In a photograph of a recumbent figure, for instance, those parts of it, such as the feet, that are nearest the lens will seem unnaturally large, those at a distance, such as the head, unnaturally small. The artist may either record this effect exactly, producing a startling illusion of reality that seems to violate the picture plane (surface of the picture), or modify it, slightly reducing the relative size of the nearer part of the object, so as to make a less aggressive assault on the viewer's eye and to relate the foreshortened object more har-

moniously to the rest of the picture. Insofar as foreshortening is basically concerned with the persuasive projection of a form in an illusionistic way, it is a type of perspective, but

Foreshortened figure of Christ, "The Mourning over the Dead Christ," oil painting by Andrea Mantegna, c. 1475(?); in the Brera, Milan

SCALA—Art Resource

the term foreshortening is almost invariably used in relation to a single object, or part of an object, rather than to a scene or group of objects.

forest, complex ecological system in which trees are the dominant life form.

A brief treatment of forests follows. For full treatment, see MACROPAEDIA: Biosphere, The.

Tree-dominated forests can occur wherever the temperatures rise above 10° C (50° F) in the warmest months and the annual precipitation is more than 200 mm (8 inches). They can develop under a variety of conditions within these climatic limits, and the kind of soil, plant, and animal life differs according to the extremes of environmental influences. In cool, high-latitude subpolar regions, forests are dominated by hardy conifers like pines, spruces, and larches. These taiga (boreal) forests have prolonged winters and between 250 and 500 mm (10 and 20 inches) of rainfall annually. In more temperate high-latitude climates, mixed forests of both conifers and broad-leaved deciduous trees predominate. Broad-leaved deciduous forests develop in middle-latitude climates, where there is an average temperature above 10° C (50° F) for at least six months every year and annual precipitation is above 400 mm (16 inches). A growing period of 100 to 200 days allows deciduous forests to be dominated by oaks, elms, birches, maples, beeches, and aspens. In the humid climates of the equatorial belt, tropical rainforests develop. There heavy rainfall supports evergreens that have broad leaves instead of needle leaves, as in cooler forests. In the lower latitudes of the Southern Hemisphere, the temperate deciduous forest reappears.

Forest types are distinguished from each other according to species composition (which develops in part according to the age of the forest), the density of tree cover, type of soils found there, and the geologic history of the forest region.

Soil conditions are distinguished according to depth, fertility, and the presence of perennial roots. Soil depth is important because it determines the extent to which roots can penetrate into the earth and, therefore, the amount of water and nutrients available to the trees. The soil of taiga forests is sandy and quickly drained. Deciduous forests have brown soil, richer than sand in nutrients, and less porous. Rainforests and savanna woodlands have a soil layer rich in iron or aluminum, which give the soils either a reddish or yellowish cast. The amount of water available to the soil, and therefore available for tree growth, depends

on the amount of annual rainfall. Water may be lost by evaporation from the surface or by leaf transpiration. Evaporation and transpiration also control the temperature of the air in forests, which is always slightly warmer in cold months and cooler in warm months than the air in surrounding regions.

The density of tree cover influences the amount of both sunlight and rainfall reaching every forest layer. A full-canopied forest absorbs between 60 and 90 percent of available light, most of which is absorbed by the leaves for photosynthesis. The movement of rainfall into the forest is considerably influenced by leaf cover, which tends to slow the velocity of falling water, which penetrates down to the ground level by running down tree trunks or dripping from leaves. Water not absorbed by the tree roots for nutrition runs along root channels, so water erosion is therefore not a major factor in shaping forest topography.

Forests are among the most complex ecosystems in the world, and they exhibit extensive vertical stratification. Conifer forests have the simplest structure: a tree layer rising to about 98 feet (30 m), a shrub layer that is spotty or even absent, and a ground layer covered with lichens, mosses, and liverworts. Deciduous forests are more complex; the tree canopy is divided into an upper and lower story, while rain forest canopies are divided into at least three strata. The forest floor in both of these forests consists of a layer of organic matter overlying mineral soil. The humus layer of tropical soils is affected by the high levels of heat and humidity, which quickly decompose whatever organic matter exists. Fungi on the soil surface play an important role in the availability and distribution of nutrients, particularly in the northern coniferous forests. Some species of fungi live in partnership with the tree roots, while others are parasitically destructive.

Animals that live in forests have highly developed hearing, and many are adapted for vertical movement through the environment. Because food other than ground plants is scarce, many ground-dwelling animals use forests only for shelter. In temperate forests, birds distribute plant seeds and insects aid in pollination, along with the wind. In tropical forests, fruit bats and birds effect pollination. The forest is nature's most efficient ecosystem, with a high rate of photosynthesis affecting both plant and animal systems in a series of complex organic relationships.

Forest Cantons, League of the Three: *see* Everlasting League.

forest fire, uncontrolled fire occurring in vegetation more than 6 feet (1.8 m) in height. These fires often reach the proportions of a major conflagration and are sometimes begun by combustion and heat from surface and ground fires. A big forest fire may crown, that is, spread rapidly through the topmost branches of the trees before involving undergrowth or the forest floor. As a result, violent blowups are common in forest fires, and they may assume the characteristics of a fire storm. *See* wildland fire.

Forest Heath, district, county of Suffolk, England. It takes its name from the vegetation of the area, which is a mixture of heathlands and forest plantations characteristic of the larger region known as the Breckland. With an area of 144 square miles (374 square km), it occupies the northwestern corner of the county. The local government reorganization of 1974 (by which the Forest Heath district was created) perpetuated the county boundary between Suffolk and Cambridgeshire and attached to Forest Heath the town of Newmarket, whose natural connection might

have been considered to link it with Cambridge rather than with the empty hinterland of Forest Heath. The district thus includes Newmarket town, with its horse racetracks and gallops, upon which Newmarket so largely depends for its livelihood and renown. Pop. (1998 est.) 69,200.

Forest Hills, residential section of the borough of Queens, New York City, southeastern New York, U.S., on Long Island. Originally part of a district called Whitepot, which was settled about 1652, it was named Forest Hills in about 1910 for its location on wooded heights. The stadium of the West Side Tennis Club in Forest Hills was the site of the U.S. national lawn tennis tournaments from 1915 until they were moved in 1978 to Flushing Meadows Park (also in Queens).

Forest of Dean, district, county of Gloucestershire, south-central England, occupying an area of 204 square miles (528 square km) in the western part of the county. It is bordered on the southeast by the broad estuary of the River Severn and on the southwest by the River Wye, which (for the most part) forms the border with Wales. The district takes its name from one of the great primeval forests of England that still covers much of the 500- to 800-foot- (150- to 245-metre-) high sandstone ridges and valleys of the south-central part of the district. The woodland area was designated a national forest park in 1939. Its oaks, ashes, birches, and ferns have overlapped a coalfield little worked since the early 1960s and an ancient ironworks much used by the Crusaders. Timber from the forest was utilized in the construction of ships between the 16th and 18th century.

Coleford, the district seat, Cinderford, and Mitcheldean, all former coal-mining centres, are parishes (towns) in the region. Sheep and cattle are grazed, and dairying is the most significant economic endeavour along the fertile strip of lowland bordering the Severn. Limestone is quarried from the cliffs above the Wye valley. Dairy cattle also graze the fertile loams and marls of the Vale of Newent west of the city of Gloucester in the northern part of the district. Greenhouse produce (including lettuce, cucumbers, and tomatoes) is grown there, together with apples and pears for cider and perry (fermented pear juice). The Newent area is known for its fields of wild daffodils. Light industrial manufactures of the district include automobile accessories and plastics. Pop. (1998 est.) 77,800.

Forest Park, village, western suburb of Chicago, Cook county, northeastern Illinois, U.S., on the Des Plaines River. Founded in 1856 by German settlers, it was named Forest Park in 1907 for the adjacent villages of River Forest and Oak Park. Half of the older area is occupied by cemeteries, including Forest Home on the site of a Potawatomi village and burial ground (a collection of Potawatomi artifacts is displayed in the village library). Inc. 1884. Pop. (1999 est.) 14,184.

forester, also called GRAY KANGAROO, one of the largest species of kangaroo (*q.v.*).

Forester, C(ecil) S(cott) (b. Aug. 27, 1899, Cairo, Egypt—d. April 2, 1966, Fullerton, Calif., U.S.), British historical novelist and journalist, best known as the creator of the British naval officer Horatio Hornblower, whose rise from midshipman to admiral and peer during the Napoleonic Wars is told in a series of 12 novels, beginning with *The Happy Return* (1937; U.S. title *Beat to Quarters*).

Abandoning medicine for writing, Forester achieved success with his first novel, *Payment Deferred* (1926); others included *Brown on Resolution* (1929), *The Gun* (1933), *The General* (1936), and *The Ship* (1943). Many of his novels were adapted to motion pictures; most notable among them is *The African Queen*

(1935), which was made into an extraordinarily successful film in 1951 by writer James Agee and director John Huston. Forester also wrote biographies and history books, including *The Last Nine Days of the Bismarck* (1959; also entitled *Sink the Bismarck!*). Forester described the genesis and progress of the Hornblower series in the self-revealing *Hornblower Companion* (1964). He was corre-

Forester

spondent for *The Times* (London) during the Spanish Civil War and the German occupation of Czechoslovakia. During World War II, he worked as a propagandist in Great Britain and the United States. The last of the Hornblower books, *Hornblower and the Crisis* (1967), was published posthumously.

forester moth (*Procris*, or *Ino*), any of a genus of moths of the family Zygaenidae that are closely related to the burnet moths and are widespread in the Northern Hemisphere. The adult moth has shining green forewings (span about three centimetres), translucent, dark hind wings, and an iridescent body. The insect's green appearance at rest may have given rise to the common name forester. Young larvae bore into leaves of various herbaceous plants and feed within the tissues. Larger larvae stay under leaves and spin a tough, white, silken cocoon in which to pupate, often on a grass stem. Adult foresters are weak fliers and take to the wing only in sunshine.

Forester Peninsula, peninsula in southeastern Tasmania, Australia, measuring 12 by 9 miles (19 by 14 km) and bounded by the Tasman Sea (east) and by Norfolk Bay (west). To the north the promontory is connected to the mainland by a short isthmus, and to the south it is linked to the Tasman Peninsula by the ¼-mile-wide Eaglehawk Neck. The latter feature provided the only land route to freedom for the prisoners at the Port Arthur penal colony, and guard dogs chained together across the width of Eaglehawk Neck were used to discourage escapees. Among the notable landforms of Forester Peninsula is a 10-acre (4-hectare) area of "tessellated pavement," which was declared a State Reserve in 1966.

forestry, the management of forested land, together with associated waters and wasteland, primarily for harvesting timber but also for conservation and recreation purposes.

A brief treatment of forestry follows. For full treatment, *see* MACROPAEDIA: Forestry and Wood Production.

About one-third of the world's land surface is classified as forest land, and approximately 1 percent of the standing timber is harvested each year. Almost half of the felled timber is used for fuel, the remainder being made into wood products or pulp for paper and packaging materials. The trees providing the raw

materials are grouped into three general classifications: conifers, broad-leaved tree, and monocotyledons.

Almost all conifers, which are also called softwood or gymnosperm ("naked-seeded") trees, are evergreen. The most common include species of northern pine (of the genus *Pinus*), spruce (*Picea*), Douglas fir (*Pseudotsuga*), cedar (*Cedrus*), cypress (*Cupressus*), redwood (*Sequoia*), and hemlock (*Tsuga*). Conifers are characterized by their needle-shaped leaves.

The broad-leaved, or hardwood, trees thrive not only in temperate climates but also in subtropical and tropical forests. This group includes species of such temperate trees as oak (*Quercus*), elm (*Ulmus*), birch (*Betula*), ash (*Fraxinus*), maple (*Acer*), chestnut (*Castanea*), poplar (*Populus*), beech (*Fagus*), and alder (*Alnus*), as well as such semitropical and tropical evergreens as eucalyptus (*Eucalyptus*), teak (*Tectona grandis*), mahogany (*Swietenia macrophylla*), and balsa (*Ochroma pyramidale*).

Monocotyledons, or monocots, include palm and bamboo and are found mainly in tropical and subtropical climates.

The science of forestry is built around the principle of multiple-use land management, although the harvesting and replanting of timber are still the primary activities.

Forez, also spelled **FORES**, or **FOREST**, former region of France lying on the eastern side of the Massif Central and included within the modern *département* of Loire. The name is derived from that of its capital, Feurs (Forum

The county of Forez c. 1035

From W. Shepherd, *Historical Atlas*, Harper & Row, Publishers (Barnes & Noble Books) New York, revision Copyright © 1964 by Barnes & Noble Inc.

Segusiavorum in Roman times), a town midway between Roanne and Saint-Étienne, in an agriculturally rich area watered by the Loire River. The counts of Forez vied with the archbishops of Lyon for control of the Lyonnais from the latter part of the 10th century until 1173, when they were forced to renounce their claims to all but the county of Forez. From 1368 until 1527 Forez formed part of the Bourbon territories; in 1527 King Francis I seized the county and incorporated it into the new province of Lyonnais.

Forfar, small burgh (town), in the council area and historic county of Angus, eastern Scotland, situated at the eastern end of Forfar Loch (lake) in the scenic valley of Strathmore. It was in existence by 1057, when an early Scottish Parliament met in the castle to confer titles on the nobility. The castle also figured in English-Scottish conflicts and was finally seized and destroyed by Robert I (the Bruce) in the 14th century. Industries include food processing, textiles, and electronics. Forfar is the historic county town (seat) and administrative centre of Angus. Pop. (2001) 10,797.

Forfarshire (Scotland): see Angus.

forge, open furnace for heating metal ore and metal for working and forming. From earliest times, smiths heated iron in forges and formed it by hammering on an anvil. A bellows operated by an assistant or by a foot treadle provided the forced draft for raising the

"Buffalo Forge Co.," lithograph by Gies and Co., Buffalo, New York, c. 1877

Brown Brothers

temperature of the fire. Later, a waterwheel or animal power was often used to operate the bellows; modern forges have mechanically powered bellows or rotary blowers.

forgery, in art, a work of literature, painting, sculpture, or *objet d'art* that purports to be the work of someone other than its true maker. The range of forgeries extends from misrepresentation of a genuine work of art to the outright counterfeiting of a work or style of an artist.

The fundamental consideration in determining forgery is "intent to deceive," and the primary motivation behind the practice is profit. Forgery may also be a means by which artists gain recognition of their skill or relish the deception of critics who had rejected their original work. Two further motivations behind forgery may be noted: from time to time forged documents have been produced to exalt or malign some religion, political party, or race; and forgeries are sometimes created as a hoax. Some hoaxes are intended to confound or ridicule the experts; others are intended to parody or burlesque an artist or genre.

Literary forgeries. One notorious literary forger was Thomas James Wise (1859–1937), once considered to be one of the most distinguished private book collectors of the Western world. His Ashley Library in London became a place of pilgrimage for scholars from Europe and the United States. He constantly exposed piracies and forgeries and denied that he was a dealer. The shock was accordingly the greater when in 1934 he was proved to have forged some 40 or 50 19th-century pamphlets that had commanded high prices. Subsequently Wise was indicted for other and more serious offenses, including the sophistication of many of his own copies of early printed books with leaves stolen from copies in the British Museum.

No forgery to attain recognition is better known than the "Thomas Rowley" poems of Thomas Chatterton (1752–70), which the youthful author attempted to pass off as the work of a medieval cleric. These poems, which caused a scholarly feud for many years, were influential in the Gothic revival. Chatterton, however, enjoys a place in English letters as a creative genius in his own right. The more conventional forger William Henry Ireland (1777–1835) cheerfully manufactured Shakespearean documents until his forged "lost" tragedy *Vortigern and Rowena* was laughed off the stage at the Drury Lane Theatre, London, in 1796.

Jean Mabillon in his great work *De re diplomatica* (1681) formulated methods for deter-

mining the authenticity of a document by examining the writing and the style of the terminology. These techniques have developed during three centuries into the modern sciences of paleography and diplomatics, by which various scripts and formulas can be assigned to particular ages and localities, and effective comparison can be made between two examples of handwriting purporting to come from the same pen. Thus it is possible to state that a particular document could not have been written at the date that it bears. Analogous methods are used in dealing with printed texts.

Forgery in the visual arts. The forgery of art is by no means a modern phenomenon: in the 1st and 2nd centuries AD, Roman sculptors made replicas of Greek statues and offered them not as contemporary work but rather as booty from Greece worth a great price. In the millennia that have passed since the market for art came into being, many means for counterfeiting art have arisen.

The work of a minor artist, for example, may be altered to pass for the work of a master. Alternatively the forger may paint a scene on old material, thereby lending credibility to any claim of extreme age. Even more deceptive are forgeries and copies coeval with the original work. Such objects show the results of natural aging processes and must be detected by connoisseurship instead of by technical means. Forgeries made long after the original, however, often betray their age through anachronisms in costumes, composition, iconography, technique, or materials. The last two variables can be investigated by means of a large arsenal of technical facilities, including chemical analysis, microscopy, radiography, and X-ray, infrared, and ultraviolet photography. Such techniques are effective in analyzing paintings with their relatively large number of different materials, but they are useless on stone sculpture, unless it is polychromed, because the work consists entirely of chemically inert, homogeneous material.

In the composite fraud, or pastiche, the forger combines copies of various parts of another artist's work to form a new composition and adds a few connecting elements of his own to make it a convincing presentation. This type of forgery—evident in the Vermeer forgeries of Ilan van Meegeren—can be very deceptive, because a creative artist often borrows from his own work. In fact, the similarity of a figure or an object in a forgery to that in a well-known work of art often adds to the believability of the new creation. Van Meegeren employed a combined composite and stylistic procedure in seven paintings he made between 1936 and 1942. In "The Supper at Emmaus" he combined figures, heads, hands, plates, and a wine jar from various early genuine Vermeers; it was hailed as a masterpiece and the earliest known Vermeer. Ironically, van Meegeren never was detected as a forger. At the end of World War II he was arrested for having sold a painting attributed to Vermeer to one of the enemy and was accused of being a collaborator. He chose to reveal himself as a forger, which was a lesser offense, and proved his confession by painting another "Vermeer" while in prison.

A variation in composite forgery, quite common with inlaid French furniture, involves the use of parts from damaged but genuine pieces to create a single complete piece that may or may not resemble one of the pieces from which it has been made. Most difficult of all to detect is a forgery done in the style of a particular artist or age. A skillful forger is able to absorb the attitudes, conventions, and techniques of the period and can create a successful piece of duplicity.

The key to detecting forgery of unique ob-

jects lies in the fact that every object has within itself evidence of the time and the place in which it was made. Two main approaches, stylistic and technical analysis, are complementary and are best used together.

Documentation is also an important area of investigation. The apparent authenticity of many spurious pieces is bolstered by false documents to attest to the point of origin, former owners, and expert opinions concerning the pieces. A careful examination of these records is also helpful in detecting forgeries.

forgery, in law, making of a false writing with an intent to defraud. Writing, to be forgery, must either have legal significance or be commonly relied upon in business transactions. It need not be handwriting; the law of forgery covers printing, engraving, and typewriting as well. In most jurisdictions, however, "writing" excludes objects such as works of art, which when misrepresented are legally considered to be falsifications or frauds.

Checks, negotiable instruments, contracts, wills, and deeds are examples of documents that may be forged. But forgery also encompasses some documents that have no legal efficacy but are commonly relied upon in the business world, such as a false letter of recommendation for employment.

The forger may begin with an entirely blank piece of paper, with an incomplete genuine instrument with blanks to be filled, or with a complete genuine instrument that may be altered. The usual manner of forging is to prepare a false writing and sign another's name to it or to make a material alteration to a valid writing already signed by another. But a writing that contains false statements is not necessarily the "false-writing" that forgery requires. A check drawn on a bank wherein the drawer has no funds is not a forgery even though the drawer implies that he has funds there, but it is a genuine writing containing lies; the crime, therefore, is that of obtaining property by false pretenses.

It is not forgery to sign another's name or to fill in blanks or alter a genuine writing in the honest, though mistaken, belief that such conduct is authorized. There must be fraudulent intent. If such intent is present, there is forgery even if no one is actually defrauded by the false document.

One who does not himself forge an instrument may be guilty of the related crime of uttering a forged instrument, that is, the offering as genuine of a writing that the offender knows to be false—done with intent to defraud. Some modern statutes include this crime with forgery. *See also* counterfeiting.

forget-me-not, any of about 50 species of the plant genus *Myosotis* (family Boraginaceae),

Woods forget-me-not (*Myosotis sylvatica*)
Ingmar Holmasen

native to temperate Eurasia and North America and to mountains of the Old World tropics. Some are favoured as garden plants for their clusters of blue flowers. (For Chinese forget-me-not, *see* hound's-tongue.)

The woods forget-me-not (*M. sylvatica*), like most other *Myosotis*, changes colour from pink to blue as the tubular, flaring, five-lobed flower matures.

The water forget-me-not (*M. scorpioides*), shorter and weaker stemmed, grows in marshlands but is otherwise similar. Both are perennial and occur in white- and pink-flowered forms as well as blue.

forging, in metallurgy, process of shaping metal and increasing its strength by hammering or pressing. In most forging an upper die is forced against a heated workpiece positioned on a stationary lower die. If the upper die or hammer is dropped, the process is known as drop forging. To increase the force of the blow, power is sometimes applied to augment gravity. The number of blows struck is carefully gauged by the operator to give maximum effect at minimum wear on the die.

For high-speed work in which the heavy impact of the drop hammer is not needed, an adaptation of the old-fashioned smith's technique, called helve-hammer forging, is used. The striking force is delivered by a wooden helve (handle) operating with the motion of a hand sledge. The helve hammer is usually used for preparatory and finishing operations.

Forging presses employ hydraulic or mechanical pressure instead of the blows of the drop forge. Most forging presses can exert only a few hundred tons of pressure, but giant presses, used for forging parts of jet aircraft, are capable of up to 50,000 tons of pressure.

Several other forging processes are also used. In roll forging, the metal blank is run through matched rotating rolls with impressions sunk in their surfaces. Impact forging is essentially hammer forging in which both dies are moved horizontally, converging on the workpiece. Counterblow forging is similar, except that the dies converge vertically. A principal advantage of these last two methods is that the two dies mutually absorb energy, eliminating the need for heavy foundations.

Forio, resort town and seaport on the western coast of the volcanic island of Ischia, Napoli province, Campania region, southern Italy. It is the centre of a productive wine-making region. The wine is called Epomeo after Mt. Epomeo, the extinct volcano that is at least partially responsible for the island's fertile volcanic soils. Forio—like Casamicciola, Lacco Ameno, and other cities on Ischia—has thermal mineral springs and is a popular vacation site. Pop. (2002 est.) 14,572.

fork, implement consisting of two or more prongs supported by a handle, used for cooking, serving, and eating food. Forks and spoons together are known as flatware (*q.v.*).

fork moss: *see* wind-blown moss.

Forkel, Johann Nikolaus (b. Feb. 22, 1749, Meeder, near Coburg, Saxony—d. March 20, 1818, Göttingen, Westphalia), one of the first great musicologists and the first biographer of Johann Sebastian Bach. After brief legal studies, he became organist at the university church at Göttingen, where, from 1778 until his death, he was musical director of the university. Forkel's most important work is probably his *Allgemeine Literatur der Musik* (1792). His *Über Johann Sebastian Bachs Leben, Kunst und Kunstwerke* (1802) remains valuable (Eng. trans. by C.S. Terry, 1920).

forklift truck, specialized form of industrial truck (*q.v.*) for elevating or lowering a load.

forktail, any of seven species of birds of the Asian, chiefly Himalayan, genus *Enicurus*.

Spotted forktail (*Enicurus maculatus*)
Painting by H. Douglas Pratt

Forktails usually are placed among the Old World flycatchers Muscicapidae (order Passeriformes). Forktails pick insects from stones along mountain streams and have loud whistling calls. Most are strikingly patterned in black and white and have deeply forked tails, which they sway up and down. Six of the species are long-tailed and about 28 centimetres (11 inches) in length; examples are the spotted forktail (*E. maculatus*) and the black-backed forktail (*E. immaculatus*), both ranging to Indochina. The little forktail (*E. scouleri*), ranging to Taiwan, has a shorter tail than the other species.

Forlandet National Park, Norwegian FORLANDET NASJONALPARK, formerly PRINS KARLS FORLAND NASJONALPARK, national park established in 1973 by Norway's Environment Ministry for Svalbard. The Forlandet National Park has a number of bird sanctuaries and is an important breeding area for eider ducks and geese.

Forlì, Latin FORUM LIVII, city, capital of Forlì-Cesena province, Emilia-Romagna region, in northern Italy on the Fiume (river) Montone and the Via Aemilia, southeast of Bologna. Known to the Romans as Forum Livii, it is said to have been founded by the consul Livius Salinator in the 2nd century BC. As a 12th-century commune, it was in league with Ravenna, and in the 13th century it was the seat of the imperial count of Romagna province, a position that led to its deep involvement in the conflicts between Guelf and Ghibelline (papal and imperial) factions. Ruled by the Ordelaffi family from 1315, Forlì was taken by Cesare Borgia, the cardinal and military leader, in 1500 and annexed to the Papal States in 1504. It became part of the Kingdom of Italy in 1860.

Notable buildings include the 12th-century abbey of S. Mercuriale, the origins of which go back to the earliest bishops of Forlì in the 4th century; the 15th-century fortress of Caterina Sforza Riario, who defended it against Borgia; the cathedral, entirely rebuilt in the 19th century; and the town hall (1459). The chief works of the painter Melozzo da Forlì are in Rome and Loreto, but Forlì's art gallery contains works by Marco Palmezzano, a disciple of Melozzo and also a native of the city. The civic museum and library have fine collections.

Forlì is on the main railway and road from Milan to Bari and Brindisi and has an airport. The surrounding land is very fertile, and agriculture is the most important economic activity. Industries include the manufacture of artificial textiles, chemicals, shoes, and metal products. Pop. (2002 est.) 108,249.

form, the external shape, appearance, or configuration of an object, in contradistinction to the matter of which it is composed; in metaphysics, the active, determining principle of a thing as distinguished from matter, the potential principle.

The word "form" has been used in a number of ways throughout the history of philosophy and aesthetics. It was early applied to Plato's term *eidōs*, by which he identified the permanent reality that makes a thing what it is, in contrast to the particulars that are finite and subject to change. The Platonic concept of form was itself derived from the Pythagorean theory that intelligible structures (which Pythagoras called numbers), and not material elements, gave objects their distinctive characters. Plato developed this theory into the concept of "eternal form," by which he meant the immutable essence that can only be "received" or "imitated" by material, or sensible, things. Plato held that eternal forms, though they were not tangible, were of a higher reality than material objects.

For practical purposes Aristotle was the first to distinguish between matter (*hypokeimenon* or *hylē*) and form (*eidōs* or *morphe*). He rejected the abstract Platonic notion of form and argued that every sensible object consists of both matter and form, neither of which can exist without the other. To Aristotle matter was the undifferentiated primal element; it is that from which things develop rather than a thing-in-itself. The development of particular things from this germinal matter consists in differentiation, the acquiring of the particular forms of which the knowable universe consists. Matter is the potential factor, form the actualizing factor. (Aristotle further posited the existence of a prime, or unmoved, mover, *i.e.*, pure form separate from matter, eternal and immutable.)

Thus according to Aristotle, the matter of a thing will consist of those elements of it which, when the thing has come into being, may be said to have become it; and the form is the arrangement or organization of those elements, as the result of which they have become the thing which they have. Thus, bricks and mortar are the matter that, given one form, become a house, or, given another, become a wall. As matter they are potentially anything that they can become; it is the form which determines what they actually become. Here "matter" is a relative term, for a brick on the pile, while potentially part of a house, is already actually a brick; *i.e.*, it is itself a composite of form and matter, clay being matter to the brick as the brick is to the house or to the wall. Matter is that which is potentially a given object but which actually becomes that object only when it is given the right form.

Aristotle's notion of form combines with his teleological viewpoint to give the conclusion that formal development has a direction and may have a goal and that some things are more informed than others. Bricks are more informed than clay, and a house more than bricks.

The Aristotelian concept of form was uniquely adapted to Christianity by Thomas Aquinas, whose works mark the high point of the medieval Scholastic tradition. Aquinas further delineated the concept of form to include "accidental form," a quality of a thing that is not determined by its essence; "sensible form," that element of form that can be distinguished from matter by sense-perception; and other such distinctions. Other Scholastic philosophers, including John Duns Scotus and William of Ockham, worked with the Aristotelian concept of form, but none to as great an effect as Aquinas.

For 18th-century German philosopher Immanuel Kant, form was a property of mind; he held that form is derived from experience, or, in other words, that it is imposed by the individual on the material object. In his *Cri-*

tique of Pure Reason Kant identified space and time as the two forms of sensibility, reasoning that though man does not experience space and time as such, he cannot experience anything except in space and time. Kant further delimited 12 basic categories that act as structural elements for human understanding.

Criticism. The concept of form is also indispensable to the practice and criticism of several disciplines other than philosophy. In literature, for example, the term may refer to the schema, structure, or genre that a writer chooses for the presentation of his subject—*e.g.*, novel, short story, maxim, haiku, sonnet, etc.; it may also refer to the internal structure of the work, and, to a great extent, a work's critical success depends on the degree to which the artist is able to integrate the content and internal structure within the framework of its external form. In criticism of the graphic arts, the term form refers to the effect achieved by draftsmanship or mass as distinct from that achieved by such elements as colour or texture. In sculpture and other plastic arts, form (or shape) is both tangible and visible and thus is the chief element of organization.

formal system, also called LOGISTIC SYSTEM, in logic and mathematics, abstract, theoretical organization of terms and implicit relationships that is used as a tool for the analysis of the concept of deduction. Models—structures that interpret the symbols of a formal system—are often used in conjunction with formal systems.

Each formal system has a formal language composed of primitive symbols acted on by certain rules of formation (statements concerning the symbols, functions, and sentences allowable in the system) and developed by inference from a set of axioms. The system thus consists of any number of formulas built up through finite combinations of the primitive symbols—combinations that are formed from the axioms in accordance with the stated rules.

In an axiomatic system, the primitive symbols are undefined; and all other symbols are defined in terms of them. In the Peano postulates for the integers, for example, 0 and ' are taken as primitive, and 1 and 2 are defined by $1 = 0'$ and $2 = 1'$. Similarly, in geometry such concepts as "point," "line," and "lies on" are usually posited as primitive terms.

From the primitive symbols, certain formulas are defined as well formed, some of which are listed as axioms; and rules are stated for inferring one formula as a conclusion from one or more other formulas taken as premises. A theorem within such a system is a formula capable of proof through a finite sequence of well-formed formulas, each of which either is an axiom or is inferred from earlier formulas.

A formal system that is treated apart from intended interpretation is a mathematical construct and is more properly called logical calculus; this kind of formulation deals rather with validity and satisfiability than with truth or falsity, which are at the root of formal systems.

In general, then, a formal system provides an ideal language by means of which to abstract and analyze the deductive structure of thought apart from specific meanings. Together with the concept of a model, such systems have formed the basis for a rapidly expanding inquiry into the foundations of mathematics and of other deductive sciences and have even been used to a limited extent in analyzing the empirical sciences. *See* also deontological ethics; metalogic; metatheory.

formaldehyde, also called METHANAL (formulated HCHO), an organic compound, the simplest of the aldehydes, used in large amounts in a variety of chemical manufacturing processes. It is produced principally by the vapour-phase oxidation of methanol and is commonly sold as formalin, a 37 percent aque-

ous solution. Formalin may be dehydrated to trioxane, a crystalline trimer, or to an amorphous polymer, paraformaldehyde, which is a convenient source of gaseous formaldehyde.

Formaldehyde and ammonia yield methenamine, or hexamethylenetetramine, which is used as a urinary antiseptic. Nitration of methenamine gives the explosive cyclonite, or RDX. Formaldehyde and acetaldehyde react in the presence of calcium hydroxide to give pentaerythritol, the tetranitrate of which is the explosive PETN. Large quantities of formaldehyde are used in the manufacture of urea-formaldehyde, phenol-formaldehyde, and acetal resins. The reaction of formaldehyde with proteins leads to its use in the tanning industry and in treating various vegetable proteins to render them fibrous. The reactivity with proteins is also the basis for the use of formaldehyde as a disinfectant, an embalming agent, and a soil sterilant.

Pure formaldehyde is a colourless, flammable gas with a strong pungent odour; it is extremely irritating to the mucous membranes.

formalin, aqueous solution of formaldehyde (*q.v.*).

formalism, in mathematics, school of thought introduced by the 20th-century German mathematician David Hilbert, which holds that all mathematics can be reduced to rules for manipulating formulas without any reference to the meanings of the formulas. Formalists contend that it is the mathematical symbols themselves, and not any meaning that might be ascribed to them, that are the basic objects of mathematical thought. *Compare* intuitionism; logicism.

formalism, in art, representation of objects in terms of abstract geometrical form rather than of natural appearance for decorativeness or symbolism and also, by extension, the stereotyping of forms by tradition for the same reasons. Formalism corresponds to "stylization" but should be distinguished from the 20th-century notion of abstract art, which is a free arrangement of nonrepresentational shapes.

From early times examples of formalism in both senses are to be found in Neolithic statuettes and wooden sculpture and masks from Africa and Oceania, in the decoration of primitive pottery and Chinese bronze and jade, and in the object-symbols that make up the pattern of Oriental carpets; religious art has produced the hieratic figures of Byzantine mosaics and Russian icons and the Buddhist statuary of the Far East, all recognizable at once from pose and habiliments (*e.g.*, the Virgin Mary's blue robe, the halo, and the lotus throne). In modern times formalism is exemplified in the paintings of the Cubist, Futurist, and Vorticism movements. In architecture such elements as columns of Doric, Ionic, or Corinthian order, pediments, and decorative key pattern of classical Greek and Roman architecture have passed down through Renaissance and Neoclassical interpretations to modern times.

Formalism, also called RUSSIAN FORMALISM, Russian RUSSKY FORMALISM, 20th-century Russian school of literary criticism. It began in two groups: Opoyaz, an acronym for Russian words meaning Society for the Study of Poetic Language, founded in 1916 at St. Petersburg (later Leningrad) and led by Victor Shklovsky; and the Moscow Linguistic Circle, founded in 1915. Both groups made use of the linguistic techniques of Ferdinand de Saussure. Although they based their assumptions largely on Symbolist notions concerning the autonomy of the text and the discontinuity between literary and other uses of language, the Formalists sought to make their critical discourse more objective and scientific than that of Symbolist criticism. Closely allied to the Rus-

sian Futurists and opposed to sociological criticism, the Formalists placed an "emphasis on the medium" by analyzing the way in which literature, especially poetry, was able to alter artistically or "make strange" common language. They stressed the importance of form and technique over content. Although always anathema to the Marxist critics, Formalism was important in the Soviet Union until 1929, when it was condemned for its lack of political perspective. Later, largely through the work of the structuralist linguist Roman Jakobson, it became influential in the West, notably in Anglo-American New Criticism (*q.v.*), which is sometimes called Formalism.

Victor Erlich's *Russian Formalism* (1955) is a history; *Théorie de la littérature* (1965) is a translation by Tzvetan Todorov of important Russian texts. Anthologies in English include L.T. Lemon and M.J. Reis, eds., *Russian Formalist Criticism* (1965) and L. Matejka and K. Pomorska, eds., *Readings in Russian Poetics* (1971).

formalistic Idealism: see transcendental Idealism.

Forman, Andrew (b. c. 1465—d. March 11, 1521), Scottish prelate and diplomat during the reigns of James IV and James V.

He was educated at the University of St. Andrews. James IV employed him as his emissary to Rome and to England, where he took part in negotiating James's marriage (1503) to Margaret Tudor. From 1511 he was engaged in furthering the King's plan for a general peace in Europe and for a great crusade against the Turks. To this end he acted as mediator between Louis XII of France and Pope Julius II, who were at war in northern Italy. Despite his record of peacemaking, Forman was blamed, perhaps unjustly, for the breach between Scotland and England leading to the death of James IV at the Battle of Flodden (Sept. 9, 1513).

Forman's career gave him opportunities of acquiring benefices in Scotland, England, and France, including the bishopric of Moray (1501) and the archbishopric of Bourges (1513), but he failed to achieve elevation to the cardinalate. In 1514 Pope Leo X nominated him to the archbishopric of St. Andrews and appointed him papal legate in Scotland, although rival claimants kept him out of his see until 1516. As archbishop he issued constitutions for the discipline of clergy and laity.

Forman, Miloš (b. Feb. 18, 1932, Čáslav, Czech.), prominent director in the flowering of Czechoslovak films during the 1960s (the Czechoslovak "New Wave") and later a prominent director in the West.

Forman graduated from FAMU, the Prague Film School. He was a scriptwriter and assistant director until the success of *Audition*, a short, independently made documentary, brought him critical recognition and the chance to direct his first feature-length film.

Miloš Forman, 1970

© alex jeffrey

The result was *Černý Petr* (1963; *Black Peter*, or *Peter and Pavla*), a lightly humorous treatment of the father-son relationship. It was followed by *Lásky jedné plavovlásky* (1965; *Loves of a Blonde*), the story of a young factory worker's romance, which established Forman's international reputation, and *Hoří, má panenko!* (1967; *Fireman's Ball*), a comedy about a provincial ball. Rich in emotion and informal in technique, his films deal mainly with the problems of the contemporary Czechoslovak teenager and sensitively portray the sorrows, joys, and humour in daily life.

In 1969 Forman left Czechoslovakia for the United States, where he directed *Taking Off* (1971), about wayward American youth and their parents, and was one of the contributing directors to *Visions of Eight* (1973), a highly personalized view of the Munich Olympic Games. Forman won an Academy Award for best direction for *One Flew over the Cuckoo's Nest* (1975) and for *Amadeus* (1984) and also won high praise for *Hair* (1979) and *Ragtime* (1981).

Forment, Damián (b. c. 1475, Valencia, Aragon—d. c. 1541, Santo Domingo de la Calzada, Castile), sculptor, recognized as perhaps the most important sculptor in 16th-century Spain. His early work demonstrated a mastery of Renaissance principles, and one of his last pieces is one of the earliest Mannerist works in Spain.

It is believed that Forment was trained in Florence and then moved back to his native Valencia for nine years (1500–1509). In 1509 he moved to Saragossa and maintained his studio there until his death, executing over the years many large altars, often in alabaster.

One of his earliest pieces is the altar in the church of El Pilar, Saragossa (1509–12), a work in a mixed style, combining Gothic ornament with Renaissance figures. He retained the Gothic frame in his sculpture until about 1520, using it in the Mannerist altarpiece for Huesca cathedral (1520–24). The figures in his early altars are much indebted to Donatello and are usually organized with careful attention to balance and symmetry. In the altar at Huesca, the figures have become elongated, and there is more movement in and out of the relief plane. His last work, the altar at Santo Domingo de la Calzada (1537–40), has a Renaissance frame, but the figures have become even more twisted and elongated. An important influence on later Spanish sculptors, he shows very clearly in his work the transition from the Gothic to the Mannerist style.

Formia, formerly MOLA DI GAETA, Latin FORMIAE, town, Latina province, Lazio (Latium) region, south central Italy, on the Golfo (gulf) di Gaeta between the mouth of the Garigliano and the Gaeta peninsula, northwest of Naples. A town of the ancient Volsci people, it was later taken by the Romans and became a popular Roman summer residence noted for the Caccuban and Falernian wines. Formia was destroyed by the Saracens in 842. There are ruins of prehistoric megalithic walls, and Roman remains include the villa of the statesman and orator Cicero and his restored mausoleum; Cicero was murdered nearby in 43 bc. The town was severely damaged in World War II but has been rebuilt. It is on the main Rome-Naples railway and has shipping services to the Isole (islands) di Ponza. Industries include food processing and the production of wine and olives. Pop. (2000 est.) mun., 36,702.

formic acid, also called METHANOIC ACID (HCO₂H), the simplest of the carboxylic acids, used in processing textiles and leather. It is made by the action of sulfuric acid upon sodium formate, which is produced from carbon monoxide and sodium hydroxide.

Formic acid is not a typical carboxylic acid: it is distinguished by its acid strength, its failure

to form an anhydride, and its reactivity as a reducing agent, a property due to the —CH=O group, which imparts some of the character of an aldehyde. The methyl and ethyl esters of formic acid are commercially produced. Concentrated sulfuric acid dehydrates it to carbon monoxide.

Pure formic acid is a colourless, fuming liquid with a pungent odour; it irritates the mucous membranes and blisters the skin. It freezes at 8.4° C and boils at 100.7° C.

Formica, trademark for hard, smooth, surface material used to make various laminated plastic products, especially tabletops and other furniture and wallboards and other constructions.

Special papers are impregnated with synthetic resins, such as melamine, then subjected to heat and pressure; about seven sheets are bonded together to form a hard and durable surfacing material, 1/16 inch (about 1 1/2 millimetres) thick. The top sheet is coloured and patterned, and the finish may be either polished or dull. Wood grain and furniture finishes, either shiny or dull, are common. Formica is usually cemented to plywood or other suitable backing.

Formica is able to withstand heat, boiling water, food acids, alcohol, and alkalis found in the home and is easily cleaned. The product made for commercial uses, such as in restaurants, may contain a very thin sheet of metal in the laminate to increase resistance to heat.

Formicariidae (bird family): see antbird.

formio (plant): see phormium.

formonitrile: see hydrogen cyanide.

Formosa (island): see Taiwan.

Formosa, province, northern Argentina, lying within the Gran Chaco, a vast alluvial plain having poor drainage. It is covered with forests, grasslands, and marshes. Formosa is bordered by Paraguay (north and east) and has an area of 27,825 sq mi (72,066 sq km). The Pilcomayo, Bermejo, and Paraguay rivers define its northern, southern, and eastern limits, respectively. The 123,600 ac (50,000 ha) Río Pilcomayo National Park abuts the Río Pilcomayo near the confluence of the Río Paraguay; large numbers of indigenous Indians live within the park together with a rich collection of fauna including the maned wolf, La Plata otter, and giant anteater.

The territory was explored in 1528 by a Spanish expedition led by Sebastian Cabot and Diego García de Moger. A Jesuit *reducción* (work mission) established in 1590 was destroyed by Indian raids in 1632. Except for occasional expeditions up the Pilcomayo and Bermejo rivers, the area remained virtually abandoned until 1763 when another *reducción* was built. Four years later the Jesuits were expelled from the New World, and until after the War of the Triple Alliance (1864–70), Formosa continued to be an extremely remote region visited only by punitive expeditions retaliating against Indian raids. Following the defeat of Paraguay, the disputed territory became officially integrated into Argentina. In 1879, to serve as the seat for territorial authorities, the city of Formosa (*q.v.*), now the provincial capital, was founded. Formosa was organized as a national territory in 1884 and became a province in 1955.

Agriculture (cotton, rice, bananas, and avocados) and cattle raising are the chief economic activities, but both are seriously handicapped by recurrent droughts and floods. A large water-control project on the Río El Riacho was begun in the 1970s. Quebracho trees (from which tannin is extracted) grow wild in the forests, providing another source of income. Pop. (1999 est.) 492,513.

Formosa, city, capital of Formosa province, northeastern Argentina, on the western bank

of the Río Paraguay, southwest of Asunción, Paraguay. It was founded in 1879 during the military conquest of the central Gran Chaco following the defeat of Paraguay in the War of the Triple Alliance (1864–70). It served as a headquarters for the newly established national territory of Gran Chaco (later subdivided into the national territory, then province, of Formosa).

Formosa is a river port and agricultural processing centre that experienced rapid growth in the 1960s and 1970s. Cattle, cotton, and rice are raised nearby. Pop. (1999 est.) 197,057.

Formosa Strait: see Taiwan Strait.

Formosan languages, aboriginal languages of Formosa (Taiwan). They are now chiefly spoken only in small communities in remote areas.

The Formosan languages belong to the Austro-onesian family. They are diverse and fall into three major branches: Atayalic, Tsonic, and Paiwanic. The last is the largest and includes Ami, Bunun, Paiwan, and Saarua.

Formosus (b. c. 816, Rome?—d. April 4, 896, Rome), pope from 891 to 896, whose posthumous trial is one of the most bizarre incidents in papal history.

In 864 he was made cardinal bishop of Porto, Italy, by Pope St. Nicholas I, who sent him to promote the conversion of Bulgaria. He was assigned missions to France by Pope Adrian II (869) and by Pope John VIII (875) but incurred the latter's mistrust in 876, fled from Rome, and was excommunicated. He was absolved under Pope Marinus I, who restored him to his see of Porto in 883. During the pontificates of popes Marinus, St. Adrian III, and Stephen V (VI), Formosus' influence grew, and he was elected Stephen's successor on Oct. 6, 891. Attempting to liberate Rome from the Spoletan Holy Roman coemperors Guy and his son Lambert, Formosus requested King Arnulf of the East Franks to invade Italy. In Rome in 896 Formosus crowned Arnulf emperor, but while preparing to attack Spoleto, Arnulf was seized with paralysis and was forced to return to Germany. Formosus died shortly thereafter, leaving the discord unresolved.

At a Roman synod (popularly called the "Cadaver Synod") conducted by Pope Stephen VI (VII), Formosus' political enemies had his corpse exhumed, propped up on a throne, and subjected to a posthumous trial—during which a deacon answered for the corpse. His election was declared invalid, his acts were quashed, and his fingers of consecration were cut off. Formosus' corpse was then cast into a grave, but later thrown into the Tiber River. These acts divided Rome politically, provoking Stephen's imprisonment and his death by strangulation. Pope Theodore II reinstated Formosus' ordinations and solemnly buried his body; Pope John IX condemned Stephen's synod and burned its acts. Formosus' letters were collected in J.-P. Migne (ed.), *Patrologia Latina*, vol. 129.

Formstecher, Solomon (b. July 28, 1808, Offenbach, Hesse [Germany]—d. April 24, 1889, Offenbach), Jewish idealist philosopher who was rabbi at Offenbach from 1842. *Die Religion des Geistes* (1841; "The Religion of the Spirit") is considered the most complete exposition of his philosophy and a thorough systematization of Judaism. He believed there were only two basic religions: the religion of nature (paganism) and the religion of spirit (Judaism). He thought the essence of Judaism was ethical. Its ethics, adulterated by myth and art, were also disseminated by Christianity and Islām but existed in purest form in Judaism.

In addition to other theological and philosophical books, Formstecher wrote a novel about ghetto life, *Buchenstein und Cohnberg* (1863).

formula weight, in chemistry, the sum of the atomic weights of all atoms appearing in a given chemical formula. It is generally applied to a substance that does not consist of individual molecules, such as the ionic compound sodium chloride. Such a substance is customarily represented by a chemical formula that describes the simplest ratio of the number of atoms of the constituent elements, i.e., an empirical formula.

forðaldar saga (Old Icelandic: "saga of antiquity"), any of a class of Icelandic sagas dealing with the ancient myths and hero legends of Germania, with the adventures of Vikings, or with other exotic adventures in foreign lands. These stories take place on the European continent before the settlement of Iceland. Though the existing forðaldar sagas were written 1250–1350, after the Icelanders' family sagas, written 1200–20, they are thought to be of earlier oral composition. Despite their fantastic content, they are written in the terse, objective style of the family sagas.

These heroic sagas have not the same literary value as the Icelanders' sagas, but, because they are based on lost heroic poetry, they are of great antiquarian interest. The most important in this respect is the *Völsunga saga*. This story of Sigurd, grandson of Völsung, is the Northern version of the story of Siegfried (*q.v.*) and of the destruction of the Burgundians told in the Middle German epic *Nibelungenlied* (*q.v.*). It differs in many particulars from the *Nibelungenlied*.

Forner, Juan Pablo (b. Feb. 23, 1756, Mérida, Spain—d. March 17, 1797, Madrid), the foremost literary polemicist of the 18th century in Spain. His brilliant wit was often admirably used against fads, affectations, and muddleheadedness but also often cruelly and spitefully against personalities.

Forner was educated in Salamanca, studying widely in Greek, Latin, Hebrew, philosophy, and law. His brilliant wit and biting sarcasm are clearly seen in his early work *Sátira contra los abusos introducidos en la poesía castellana* (1782; "Satire Against the Abuses Introduced into Castilian Poetry"), an attack against the innovations of verse styles such as *gongorismo* (an ornate and exaggerated style named after the poet Luis de Góngora). A somewhat sour personality, Forner often turned his sarcasm on his contemporaries; in *El asno erudito* (1782; "The Erudite Ass") the dramatist Tomás de Iriarte and his work came under vicious attack. A ban prevented his writing more satires after 1785. His two most important works are *Exequias de la lengua castellana* (1795; "Exequies of the Castilian Language"), a defense of Castilian literature; and *Oración apologética por la España y su mérito literario* (1786; "Arguments on Behalf of Spain and Her Literary Merits"), in which he refuted the idea that Spanish literature was of no value when compared with the literature of the rest of Europe. His poetry was largely satirical and didactic.

Føroyar (islands, Atlantic Ocean): see Faeroe Islands.

Forrer, Ludwig (b. Feb. 9, 1845, Islikon, Switz.—d. Sept. 28, 1921, Bern), Swiss statesman, twice elected federal president, who was a noted proponent of Swiss legal reform.

A leader of Zürich radicalism and a lawyer of national prominence, Forrer served between 1873 and 1900 on the federal Nationalrat (national assembly), where he continually pressed for standardization of the legal code. In 1888 he presented a motion for penal law reform, and between 1891 and 1893 he worked on the draft of an industrial insurance law that was rejected.

Following the defeat of this proposal (1900), Forrer retired briefly from political life but was elected to the Bundesrat (federal council) in 1902 and later served twice (1906, 1912) as

president of the confederation. As head of the department of posts and railways (1907), he completed the nationalization of the famous Gotthard line and worked toward the electrification of the federal railway service.

Forres, small royal burgh (town) in the council area and historic county of Moray, north-eastern Scotland, 12 miles (19 km) west-southwest of Elgin. The town's first royal charter was probably granted in 1150 by King David I and, in any case, was confirmed by James IV in 1496. The castle was a royal hunting seat frequented by the Scottish kings from William I (the Lion) onward. Sueno's Stone, situated at the east end of the town, is an impressive sculptured monolith 23 feet (7 m) high, possibly dating to the 9th century and probably commemorating a battle between Norse invaders and the native Picts and Scots. Contemporary industries include whisky distilling and tourism. Pop. (1991) 8,531.

Forrest, Edwin (b. March 9, 1806, Philadelphia—d. Dec. 12, 1872, Philadelphia), American actor who was the centre of two major scandals of the mid-19th century.

In 1820 he made his stage debut as Young Norval in John Home's tragedy *Douglas* at the Walnut Street Theatre in Philadelphia. In 1825 he played in support of Edmund Kean, and his maturity as an actor dated from this experience. During 1826 he played Othello in New York City to great critical acclaim. On offering cash prizes for plays by American authors, Forrest received several suited to his talents, including John Augustus Stone's *Metamora* and Robert Montgomery Bird's *Gladiator*; this has been considered the beginning of native American drama. Among his outstanding roles were Shakespeare's Macbeth, Hamlet, Lear, and Mark Antony.

Forrest was initially successful in his first engagement in England in 1836, when he introduced the American acting style, but a misunderstanding led him to publicly hiss a performance by William Macready, arousing great indignation in England. His disagreement with the English actor culminated in the so-called Astor Place riot in New York City in May 1849. While Macready was playing at the Astor Place Opera House, a mob of Forrest supporters stormed the theatre. The militia was called out, the rioters fought the militia, and the militia fired on the mob. Twenty-two persons were killed and 36 wounded. Forrest's reputation never quite recovered from this catastrophe, and only two years later he caused another national sensation when he instituted a divorce suit against his wife, the actress Catherine Sinclair, for adultery. Although he lost the verdict, he appealed the decision for 18 years. After 1852 Forrest acted only sporadically, spending much time alone in his gloomy Philadelphia mansion. He left most of his money for the establishment of a home for aged actors.

Opinions on Forrest as an actor varied. Although many critics considered him first-rate, he was described by the *New York Tribune* dramatic critic William Winter as "a vast animal, bewildered by a grain of genius." Richard Moody's *Edwin Forrest, First Star of the American Stage* was published in 1960.

Forrest, Sir John, also called (1918) BARON FORREST OF BUNBURY (b. Aug. 22, 1847, Preston Point, near Bunbury, Western Australia—d. Sept. 3, 1918, at sea), explorer and statesman who led pioneer expeditions into Australia's western interior. As Western Australia's first premier (1890–1901), he sponsored public works construction and negotiated the state's entry into the Australian Commonwealth in 1901.

After entering Western Australia's survey de-

partment in 1865, Forrest in 1869 led a search expedition for the missing explorer Ludwig Leichhardt and, in 1870, an expedition from Perth along the Great Australian Bight to Adelaide. In 1874 he completed a 2,700-mile (4,300-kilometre) crossing of the continent from Champion Bay to the telegraph line between Adelaide and Port Darwin.

Forrest served as state surveyor general from 1883 to 1890, when he became premier of Western Australia. Serving also as colonial treasurer, he sponsored harbour works and railroad development and introduced a plan for supplying water to the goldfields. He also worked for woman suffrage and for expanding land settlement. In the negotiations for Australian federation between 1887 and 1901, he championed the interests of smaller states, winning railroad and tariff benefits for Western Australia. He was knighted in 1891.

Elected to the first federal Parliament in 1901, he served as minister of defense (1901–03), as treasurer in several Liberal ministries between 1905 and 1914, and in the coalition wartime ministry of William Morris Hughes (1917–18). In 1918 he became the first person born in Australia to enter the British peerage; he died without male issue, and the title lapsed. He wrote *Explorations in Australia* (1875) and *Notes on Western Australia* (1884).

Forrest, Nathan Bedford (b. July 13, 1821, near Chapel Hill, Tenn., U.S.—d. Oct. 29, 1877, Memphis, Tenn.), Confederate general in the American Civil War (1861–65) who was often described as a “born military genius”; his rule of action, “Get there first with

Nathan Forrest

By courtesy of the Library of Congress, Washington, D.C.

the most men,” became one of the most often quoted statements of the war. A major blemish on his record, however, was the Massacre of Ft. Pillow (April 12, 1864)—the slaughter by his soldiers of more than 300 blacks after the surrender of Ft. Pillow, Tenn.

A self-taught man, Forrest bought and sold horses, cattle, and slaves before acquiring considerable wealth as a cotton planter in Mississippi. At the outbreak of the war, he raised a cavalry unit and, as a lieutenant colonel, took part in the defense of Ft. Donelson, Tenn. (February 1862). Refusing to capitulate with the rest of the Confederate forces, he made his way out before the fort was surrendered. After fighting with distinction at the Battle of Shiloh, Tenn. (April), he was promoted to brigadier general and took a brilliant part in the autumn campaign. The following winter he was continually active in raiding hostile lines of communication.

In keeping with Confederate policy at that time, Forrest—by then a major general—ordered his troops to “take no more Negro prisoners” when they assaulted and captured Ft. Pillow. A Congressional investigation committee verified the slaughter of more than 300 black men, women, and children within the fort.

In June 1864 Forrest decisively defeated a superior Union force at Brice’s Cross Roads, Miss., and throughout the year he conducted successful raids in Mississippi, Tennessee, and Alabama. He was once more with the main Confederate Army of the West in the last disastrous campaign of Nashville (December) and fought a stubborn rearguard action to cover the retreat of the broken army. He was forced back at Selma, Ala., in April 1865 and surrendered his entire command in May.

After the war he was active in the railroad business, and was a leading organizer and the first Grand Wizard of the original Ku Klux Klan, a secret society advocating white supremacy.

Forrest City, city and seat (1874) of St. Francis county, east central Arkansas, U.S., on the west slope of Crowley’s Ridge between the L’Anguille and St. Francis rivers. Originally a railroad camp, it was founded (1866) by the Confederate general Nathan Bedford Forrest, who contracted with the Memphis and Little Rock (now Chicago, Rock Island, and Pacific) Railroad to build a line over Crowley’s Ridge. It developed as a commercial centre for an agricultural area (cotton, corn, peaches, rice, soybeans, and sweet potatoes). Subsequently, its economy diversified to include the manufacture of electrical and farming equipment. Inc. 1870. Pop. (2000) 14,774.

Forrestal, James V(incen)t (b. Feb. 15, 1892, Beacon, N.Y., U.S.—d. May 22, 1949, Bethesda, Md.), first U.S. secretary of defense (1947–49); earlier, in the Navy Department, he directed the huge naval expansion and procurement programs of World War II.

After serving in naval aviation in World War I, Forrestal resumed his connection with a New York City investment firm, of which he became president in 1938. In June 1940 he was named administrative assistant to Pres. Franklin D. Roosevelt and in August became under secretary of the navy. In that capacity he was responsible for readying a peacetime navy to meet the enormous demands of a global war. He became secretary of the navy in May 1944 following the death of Frank Knox. Upon enactment of the National Security Act of 1947, he was appointed to the new Cabinet post of secretary of defense and initiated a reorganization and coordination of the armed services.

Forrestal resigned in March 1949. Suffering from what physicians called a depression similar to battle fatigue, he entered the Bethesda Naval Medical Center, Maryland, and soon after plunged to his death from a window.

Forrester, Jay Wright (b. July 14, 1918, Anselmo, Neb., U.S.), U.S. electrical engineer and management expert who invented the random-access magnetic core memory, the information-storage device employed in most digital computers.

Forrester was educated in electrical engineering at the University of Nebraska, Lincoln, and the Massachusetts Institute of Technology (MIT), Cambridge, where he remained to teach and do research. In 1945 he founded the Digital Computer Laboratory there and participated in the construction of Whirlwind I, an early general-purpose digital computer. During the course of this work, he realized that the slow and unreliable information-storage systems of early digital computers hindered their further development. Forrester devised in 1949 a memory system that stored information in three dimensions; in his invention a magnetic cell was employed for both storage and switching.

From 1951 until 1956, Forrester was associated with the Lincoln Laboratory, Lexington, Mass., operated by MIT for the federal government to apply electronic technology to problems of the national defense.

Forrester was led to experiment with the ap-

plication of computers to management problems. In time he devised the technique of computer simulation in which real-world relationships, such as the flow of materials in a factory, are represented as a series of interconnected mathematical equations that can be fed to the computer. As a professor in MIT’s Sloan School of Management, from 1956, Forrester wrote *Industrial Dynamics* (1961), *Principles of Systems* (1968), *Urban Dynamics* (1969), and *World Dynamics* (1971). His *Collected Papers* appeared in 1975.

Forsman, Georg Zacharias: see Yrjö-Koskinen, Sakari.

Forsmann, Werner (b. Aug. 20, 1904, Berlin—d. June 1, 1979, Schopfheim, W. Ger.), German surgeon who shared with André F. Courmand and Dickinson W. Richards the Nobel Prize for Physiology or Medicine in 1956; a pioneer in heart research, he contributed to the development of cardiac catheterization, a procedure in which a tube is inserted into a vein at the elbow and passed through the vein into the heart. While a surgical resident in Berlin (1929), Forsmann used himself as the first human subject, watching the progress of the catheter in a mirror held in front of a fluoroscope screen. Forsmann’s daring experiment was condemned at the time as foolhardy and dangerous, and in the face of severe criticism he abandoned cardiology for urology.

Forsmann’s procedure, with slight modifications, was put into practice in 1941 by Richards and Courmand, and has since become an extremely valuable tool in diagnosis and research. It has made possible, among other things, precise measurement of intracardiac pressure and blood flow, injection into the heart of drugs and of opaque material visible on X-ray photographs, and insertion of electrodes for the regulation of the heartbeat.

Forsmann graduated in medicine from the University of Berlin (1928) and then did postgraduate study in urology at Berlin and Mainz. He served as chief of surgery at the city hospital in Dresden-Friedrichstadt and in 1958 was named chief of the surgical division of the Evangelical Hospital in Düsseldorf.

Forster, town, eastern New South Wales, Australia, on Cape Hawke south of the entrance to Lake Wallis, a 30-sq-mi (80-sq-km) coastal lagoon. Founded in 1862 and named after William Forster, secretary for lands (1868–70), it was proclaimed a town in 1961. It is linked by a 1¼-mi (2-km) bridge (completed in 1959) north across the lake entrance to Tuncurry, a centre for logging operations carried on in the adjacent highlands. Both towns draw heavily upon the resources of the lake, the waters of which yield fish, prawns, and oysters for Sydney (142 mi southwest) as well as game fish for tourists. Pop. (1996) including Tuncurry, 15,493.

Forster, E(dward) M(organ) (b. Jan. 1, 1879, London—d. June 7, 1970, Coventry, Warwickshire, Eng.), British novelist, essayist, and social and literary critic. His fame rests largely on his novels *Howards End* (1910) and *A Passage to India* (1924) and on a large body of criticism.

Forster’s father, an architect, died when the son was a baby, and he was brought up by his mother and paternal aunts. The difference between the two families, his father’s being strongly evangelical with a high sense of moral responsibility, his mother’s more feckless and generous-minded, gave him an enduring insight into the nature of domestic tensions, while his education as a dayboy (day student) at Tonbridge School, Kent, was responsible for many of his later criticisms of the English public school (private) system. At King’s College, Cambridge, he enjoyed a sense of liberation. For the first time he was free to follow his own intellectual inclinations; and he gained a

E.M. Forster
BBC Hulton Picture Library

sense of the uniqueness of the individual, of the healthiness of moderate skepticism, and of the importance of Mediterranean civilization as a counterbalance to the more straitlaced attitudes of northern European countries.

On leaving Cambridge, Forster decided to devote his life to writing. His first novels and short stories were redolent of an age that was shaking off the shackles of Victorianism. While adopting certain themes (the importance of women in their own right, for example) from earlier English novelists such as George Meredith, he broke with the elaborations and intricacies favoured in the late 19th century and wrote in a freer, more colloquial style. From the first his novels included a strong strain of social comment, based on acute observation of middle-class life. There was also a deeper concern, however, a belief, associated with Forster's interest in Mediterranean "paganism," that, if men and women were to achieve a satisfactory life, they needed to keep contact with the earth and to cultivate their imaginations. In an early novel, *The Longest Journey* (1907), he suggested that cultivation of either in isolation is not enough, reliance on the earth alone leading to a genial brutishness and exaggerated development of imagination undermining the individual's sense of reality.

The same theme runs through *Howards End*, a more ambitious novel that brought Forster his first major success. The novel is conceived in terms of an alliance between the Schlegel sisters, Margaret and Helen, who embody the liberal imagination at its best, and Ruth Wilcox, the owner of the house Howards End, which has remained close to the earth for generations; spiritually they recognize a kinship against the values of Henry Wilcox and his children, who conceive life mainly in terms of commerce. In a symbolic ending, Margaret Schlegel marries Henry Wilcox and brings him back, a broken man, to Howards End, reestablishing there a link (however heavily threatened by the forces of progress around it) between the imagination and the earth.

The resolution is a precarious one, and World War I was to undermine it still further. Forster spent three wartime years in Alexandria, doing civilian war work, and visited India twice, in 1912–13 and 1921. When he returned to former themes in his postwar novel *A Passage to India*, they presented themselves in a negative form: against the vaster scale of India, in which the earth itself seems alien, a resolution between it and the imagination could appear as almost impossible to achieve. Only Adela Quested, the young girl who is most open to experience, can glimpse their possible concord, and then only momentarily, in the courtroom during the trial at which she is the central witness. Much of the novel is devoted to less spectacular values: those of seriousness and truthfulness (represented here

by the administrator Fielding) and of an outgoing and benevolent sensibility (embodied in the English visitor Mrs. Moore). Neither Fielding nor Mrs. Moore is totally successful; neither totally fails. The novel ends in an uneasy equilibrium. Immediate reconciliation between Indians and British is ruled out, but the further possibilities inherent in Adela's experience, along with the surrounding uncertainties, are echoed in the ritual birth of the God of Love amid scenes of confusion at a Hindu festival.

The values of truthfulness and kindness dominate Forster's later thinking. A reconciliation of humanity to the earth and its own imagination may be the ultimate ideal, but Forster sees it receding in a civilization devoting itself more and more to technological progress. The values of common sense, goodwill, and regard for the individual, on the other hand, can still be cultivated, and these underlie Forster's later pleas for more liberal attitudes. During World War II he acquired a position of particular respect as a man who had never been seduced by totalitarianisms of any kind and whose belief in personal relationships and the simple decencies seemed to embody some of the common values behind the fight against Nazism and Fascism. In 1946 his old college gave him an honorary fellowship, which enabled him to make his home in Cambridge and to keep in communication with both old and young until his death.

Although the later Forster is an important figure in mid-20th-century culture, his emphasis on a kindly, uncommitted, and understated morality being congenial to many of his contemporaries, it is by his novels that he is more likely to be remembered, and these are best seen in the context of the preceding Romantic tradition. The novels sustain the cult of the heart's affections that was central to that tradition, but they also share with the first Romantics a concern for the status of man in nature and for his imaginative life, a concern that remains important to an age that has turned against other aspects of Romanticism.

In addition to essays, short stories, and novels, Forster wrote a biography of his great-aunt, *Marianne Thornton* (1956); a documentary account of his Indian experiences, *The Hill of Devi* (1953); and *Alexandria: A History and a Guide* (1922; new ed., 1961). *Maurice*, a novel with a homosexual theme, was published posthumously in 1971 but written many years earlier. (J.B.B.)

MAJOR WORKS. *Novels.* *Where Angels Fear to Tread* (1905); *The Longest Journey* (1907); *A Room with a View* (1908); *Howards End* (1910); *A Passage to India* (1924); and *Maurice* (posthumously, 1971).

Other works. *Aspects of the Novel* (1927), criticism; *The Collected Tales of E.M. Forster* (1947), *Abinger Harvest* (1936), and *Two Cheers for Democracy* (1951), essays; and *Billy Budd* (1951), libretto collaboration with E. Crozier for an opera by Benjamin Britten; and *The Life to Come and Other Stories* (posthumously, 1972).

BIBLIOGRAPHY. B.J. Kirkpatrick, *A Bibliography of E.M. Forster*, 2nd ed. (1968), is supplemented by Alfred Borrello, *E.M. Forster: An Annotated Bibliography of Secondary Materials* (1973). Most manuscripts and papers are held by the Library of King's College, Cambridge; others are in the University of Texas Library. *The Abinger Edition of E.M. Forster*, series ed. by Oliver Stallybrass (final volume completed by Elizabeth Heine), was published in 9 volumes, 1972–80. The authorized biography (1979) by P.N. Furbank treats Forster's homosexuality perceptively. Critical works include: Rose Macaulay, *The Writings of E.M. Forster* (1968, reprinted 1974), a view of Forster by a late Edwardian; Lionel Trilling, *E.M. Forster: A Study*, 2nd rev. ed. (1965), an account of Forster as liberal humanist; J.B. Beer, *The Achievement of E.M. Forster* (1962), dwelling on Forster's visionary and pagan themes; and Wilfred Stone, *The Cave and the Mountain* (1966), the most complete discussion of Forster's work before the authorized

biography. G.K. Das, *E.M. Forster's India* (1978), is the best account of that aspect. The centennial of Forster's birth produced several notable books, among them Das and John Beer (eds.), *E.M. Forster: A Human Exploration* (1979), includes 24 original essays by, among others, Beer and Furbank, and Stallybrass.

Forster, Georg, in full JOHANN GEORG ADAM FORSTER (b. Nov. 26, 1754, Nassenhuben, near Danzig—d. Jan. 12, 1794, Paris), explorer and scientist who helped to establish the literary travel book as a favoured genre in German literature.

Georg Forster, engraving
Historia Photo

With his father, Johann Reinhold Forster, he emigrated to England in 1766. Both were invited to accompany Capt. James Cook on his second voyage around the world (1772–75). His account of the journey, *A Voyage Round the World* (1777), was based on his father's journals; it later appeared in a German version, *Reise um die Welt* (1778–80). A work of travel, science, and literature, the book not only established Forster as one of the most advanced German thinkers and accomplished stylists of the time but also influenced German scientific and literary writing, including that of Goethe, Johann Gottfried von Herder, and Alexander von Humboldt. In other writings Forster contributed to the scientific, especially botanical, knowledge of the South Seas.

He held professorships at the University of Kassel (1778–84), and at the University of Vilnius, Lithuania (1784–87), before becoming librarian at the University of Mainz. Sympathetic with the French Revolution, he championed the republican government in Mainz, occupied by the French in 1792, and in 1793 he went to Paris to negotiate on its behalf. Meanwhile the Germans seized Mainz. Forster spent his final days in Paris, reviled among Germans as a traitor and disillusioned by the excesses of the Reign of Terror.

Forster, John (b. April 2, 1812, Newcastle upon Tyne, Northumberland, Eng.—d. Feb. 2, 1876, London), writer and journalist,

John Forster, detail of an oil painting by C.E. Perugini, in the Victoria and Albert Museum, London

BBC Hulton Picture Library

a notable figure in mid-19th-century literary London who, through his friendship with the influential editor Leigh Hunt, became adviser, agent, and proofreader to many leading writers of the day. A close friend of Charles Dickens, he wrote *The Life of Dickens* (1872–74), an essential source book and a literary masterpiece, despite its personal bias and occasional suppressions and inaccuracies.

After early contributions to an encyclopaedia and to periodicals, he joined *The Examiner* (1833) and was its editor (1847–55). In 1855 he became secretary to the lunacy commissioners and in 1861 became a commissioner. Apart from his Dickens study, Förster's *Life and Adventures of Oliver Goldsmith* (1848; expanded into *The Life and Times . . .*, 1854), his *Walter Savage Landor* (1869), and his unfinished *Life of Jonathan Swift* (1876) remain authoritative and readable.

Förster, Josef Bohuslav, Förster also spelled FOERSTER (b. Dec. 30, 1859, Prague, Bohemia, Austrian Empire [now in Czech Republic]—d. May 29, 1951, Nový Vestec, Czechoslovakia), Czech composer belonging to the school of Antonín Dvořák and Bedřich Smetana.

The son of the organ composer Josef Förster, he studied at the Prague Conservatory and was organist at several Prague churches and music critic of *Národní Listy*. From 1893 to 1903 he lived at Hamburg, Ger., where he became a friend of Gustav Mahler and taught at the conservatory. He was music critic of *Die Zeit* in Vienna (1903–18) and from 1919 professor (later director) at the Prague Conservatory.

Josef Förster
H. Roger-Viollet

Förster's works were largely inspired by personal memories and religious subjects. They include five symphonies, four masses, and several operas, notably *Nepřemoženi* (1918; *The Invincibles*), *Srdce* (1923; *The Heart*), and *Bloud* (1936; *The Simpleton*). Though Förster's Romantic and religious outlook suggests Mahler, his simpler, lyrical works, notably the song cycle *Liebe*, show his allegiance to the heritage of Dvořák and Smetana.

Forster, Thomas (b. c. 1675—d. Nov. 3, 1738, Boulogne, France), English Jacobite and leader of the 1715 uprising in Scotland and northern England.

Forster was a member of Parliament from 1708 to 1716, but his Jacobite proclivities became known, and in 1715 he was ordered under arrest by the House of Commons. He fled before this could be done, however, and at Greenrig in Northumberland on Oct. 6, 1715, he proclaimed the Old Pretender as James III. Forster assumed command of his small band of followers but proved a poor general. After failing to take Newcastle he allowed the rebellion to degenerate into a series of purposeless marches. He was joined by the rebels from southern Scotland under William Gordon, Lord Kenmore, and the combined force marched to Kelso in Roxburghshire, where on October 22 it was further rein-

forced by a detachment of Highlanders under Brigadier William Mackintosh of Borlum. Mackintosh had considerable military talents but was obliged to serve under the incompetent Kenmore in Scotland and the no less incompetent Forster once the rebels had crossed into England. Forster expected reinforcements from the Roman Catholic gentry of the northwestern shires of England, but these failed to appear. At Preston on November 17 he capitulated, despite the protests of his officers. He escaped from prison to France, where he died some 23 years later.

Forster, William Edward (b. July 11, 1818, Bradpole, Dorset, Eng.—d. April 5, 1886, London), British statesman noted for his Education Act of 1870, which established in Great Britain the elements of a primary school system, and for his term (1880–82) as chief secretary for Ireland, where his repression of the radical Land League won him the nickname "Buckshot Forster."

Forster, born of Quaker parents, was a nephew of the philanthropist Sir Thomas Fowell Buxton and brother-in-law of the poet and scholar Matthew Arnold. A Liberal member of the House of Commons from 1861 until his death, he began in 1866 to demand universal education as an essential complement of parliamentary reform. In 1868 he was charged with preparing an elementary education bill, which was passed on Aug. 9, 1870, after a prolonged wrangle between Anglicans and Nonconformists over its religious clauses. This bill established the rudiments of a system of national education in Great Britain.

When William Gladstone temporarily retired in January 1875, Forster was strongly supported for Liberal Party leadership in the House of Commons, but he yielded to the Marquess of Hartington (afterward 8th Duke of Devonshire). On Gladstone's return to the office of prime minister in 1880, Forster was made chief secretary for Ireland. As a radical he approved of extensive land-tenure reform in Ireland, but, faced with the violence of the Irish agricultural revolution, he called for parliamentary measures of coercion to maintain law and order—a policy that completely failed. He was exhausted by his frequent travels between Dublin and London; and in Ireland, from the autumn of 1881, his life was in constant danger. In March 1882, nevertheless, he visited some of the most turbulent districts to address angry tenant farmers. On May 2, 1882, when the British government agreed to release Charles Stewart Parnell and other Irish nationalist leaders from Kilmainham jail, Forster seized the occasion to resign.

William Edward Forster, detail of an oil painting by H.T. Wells, 1875; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

Four days later his successor, Lord Frederick Cavendish, was murdered by Irish terrorists in Phoenix Park, Dublin. Forster's offer to return as temporary chief secretary was declined. Later, he made several intemperate speeches on Irish personalities and issues, and he died an avowed opponent of Gladstone's policy of Home Rule for Ireland.

Förster-Nietzsche, Elisabeth (b. July 10, 1846, Röcken, near Lützen, Prussia [Germany]—d. Nov. 8, 1935, Weimar, Saxe-Weimar-Eisenach [Germany]), sister of the German philosopher Friedrich Nietzsche, who became his guardian and literary executor.

An early believer in the superiority of the Teutonic races, she married an anti-Semitic agitator, Bernhard Förster. In the 1880s they went to Paraguay and founded Nueva Germania, a supposedly pure Aryan colony, but the enterprise failed, and Förster committed suicide. Amid a major financial scandal, Elisabeth failed to make a national hero of her husband or to salvage the colony as an island of Teutonic Christianity. She next served as Nietzsche's guardian at Weimar after his mental breakdown in 1889. On his death (1900) she secured the rights to his manuscripts and renamed her family home the Nietzsche-Archiv. Refusing public access to her brother's works, she edited them without scruple or understanding.

While Elisabeth gained a wide audience for her misinterpretations, she withheld Nietzsche's self-interpretation, *Ecce Homo*, until 1908. Meanwhile, she collected some of his notes under the title *Der Wille zur Macht* ("The Will to Power") and presented this work, first as part of her three-volume biography (1895–1904), then in a one-volume edition (1901), and finally in a completely remodeled two-volume edition (1906) that was widely considered Nietzsche's magnum opus. After her death scholars reedited his writings and found some of Elisabeth's versions distorted and spurious: she forged nearly 30 letters and often rewrote passages. The discovery of her forgeries and of the original texts had a profound influence on subsequent interpretations of Nietzsche's philosophy.

forsterite-fayalite series, the most important minerals in the olivine family and possibly the most important constituents of the Earth's mantle. Included in the series are the following varieties:

forsterite		
pure magnesium silicate,		
Mg ₂ SiO ₄	0% to 10% Fe	
chrysolite	10% to 30% Fe	
hyalosiderite	30% to 50% Fe	
hortonolite	50% to 70% Fe	
ferrohortonolite	70% to 90% Fe	
fayalite		
pure iron silicate,		
Fe ₂ SiO ₄	90% to 100% Fe	

These minerals are common as green to yellow, glassy crystals in many basic and ultrabasic rocks and are also abundant in chondrite meteorites. Forsterite is common in dunite, and chrysolite and hyalosiderite are common in gabbros, dolerites, basalts, and trachytes. Hortonolite and ferrohortonolite are less common but occur in dolerite, gabbro, and granophyre. Small amounts of fayalite are present in many volcanic rocks in which sodium is more common than potassium. The forsterite-fayalite minerals also occur in dolomitic limestones, marbles, and metamorphosed iron-rich sediments. These minerals are relatively infusible, not melting below 1,500° C (2,700° F), and are sometimes used in the manufacture of refractory brick. For detailed physical properties, see olivine (table).

Forsyth, Alexander John (b. Dec. 28, 1769, Belhelvie, Aberdeenshire, Scot.—d. June 11, 1843, Belhelvie), Scottish Presbyterian minister and inventor who between 1805 and 1807 produced a percussion lock for firearms that would explode a priming compound with a sharp blow, thereby avoiding the priming powder and free, exposed sparks of the flintlock system.

The son of a minister, Forsyth decided to follow his father's profession and in 1790 became his successor when the elder Forsyth

died. He began experimenting with firearms in his spare time, initially trying to improve on priming powders then in use. His first percussion system, developed in 1805, involved a small steel box, called the "scent bottle," that rotated at the breech end of the barrel and left a small charge of potassium chlorate in a small nipple leading into the barrel. This primer was then detonated by the impact of a falling hammer. When he took his device to London the following spring, the master general of ordnance provided him with work space in the Tower of London, and by 1807 Forsyth had patented a system that worked in existing firearms. A new master general abruptly terminated the work, however, and Forsyth spent the following decade and a half producing hunting firearms and protecting his patent from competitors. He was finally awarded a small pension by the government but died before the first installment reached him.

Forsyth, Peter Taylor (b. May 12, 1848, Aberdeen, Aberdeenshire, Scot.—d. Nov. 11, 1921, London, Eng.), Scottish Congregational minister whose numerous and influential writings anticipated the ideas of the Swiss Protestant theologian Karl Barth.

The son of a postman, Forsyth studied at the University of Aberdeen and at Göttingen, where he was deeply influenced by the German Protestant theologian Albrecht Ritschl. After serving several Congregational churches in England, including Emmanuel Church, Cambridge, he became principal of Hackney Theological College in London. He began as a theological liberal but gradually modified his position to one that resembled most the "positive theology" found in Germany.

His *Positive Preaching and the Modern Mind* (1907) and *Lectures on the Church and the Sacraments* (1917) recalled Protestants to the richness of their own teaching about the church at a time when liberalism and evangelicalism together were threatening to obscure it. Forsyth's most famous book, *The Person and Place of Jesus Christ* (1909), attempted "to moralize dogma," to express in terms of modern personal experience the meaning of the doctrine of Christ's divinity. In *Christ on Parnassus* (1911), dealing with theology and the arts, and in *The Justification of God* (1916), he considered the relation of Christian faith to the questions of his day.

He reasserted the classic faith of the Reformation in terms appropriate to his own time, bringing the word grace back into Protestant theology, and showing anew what was meant by the sovereignty of God as revealed in holy love in Christ. Forsyth anticipated many insights characteristic of Barth. Through Barth's work, Forsyth, often misunderstood in his own time, gained new attention.

forsythia, also called GOLDEN BELL, any member of a genus (*Forsythia*) of plants in the olive family (Oleaceae), containing seven species of ornamental shrubs native to eastern Europe and East Asia. In some species the

yellow flowers borne along the stems appear before the leaves in early spring. The narrow leaves occasionally have three parts; the star-shaped flowers have four.

Green-stem forsythia (*F. viridissima*), native to China, may grow to 3 m (10 feet); it bears greenish yellow flowers. Weeping forsythia (*F. suspensa*), also from China, has hollow, pendulous stems about 3 m long and golden-yellow flowers. Common forsythia (*F. intermedia*), a hybrid between green-stem forsythia and weeping forsythia, has arching stems to 6 m and bright yellow flowers. There also are variegated, dwarf, and many-flowered varieties.

Fort, Paul (b. Feb. 1, 1872, Reims, France—d. April 20, 1960, Argenteuil), French poet and innovator of literary experiments, usually associated with the Symbolist movement.

Fort, 1950
Lipnitzki—Violet

At the age of 18, reacting against the Naturalistic theatre, Fort founded the Théâtre d'Art (1890–93), in which formalized backcloths and stylized performances were substituted for realistic settings and acting. He also founded and edited the review *Vers et Prose* (1905–14), which published the work of Paul Valéry and other important Symbolist writers. Between 1897 and 1924 Fort produced 30 volumes of ballads. His ballad stanzas were printed in the form of prose paragraphs to emphasize the importance of rhythm and assonance over rhyme, but they were not otherwise unconventional.

Fort Archabault (Chad): see Sarh.

Fort Benton, city, seat (1865) of Chouteau county, north-central Montana, U.S., on the Missouri River. A well-known American Fur Company outpost, it was founded (1846) as Fort Lewis by Major Alexander Culbertson and was renamed in 1850 for Senator Thomas Hart Benton of Missouri. As the head of steamboat river navigation on the Missouri River, it became a boomtown as gold seekers and cattlemen, on their way west, used it as a supply point. With the building of the railroads, its importance as a transit point diminished. Cattle, sheep, and wheat are the economic mainstays of the modern city. Ruins of the old fort are along the riverfront. Inc. 1883. Pop. (1990) 1,660.

Fort-Chimo (Canada): see Kuujuaq.

Fort Collins, city, seat of Larimer county, northern Colorado, U.S. It lies along the Cache la Poudre River (the state's "Trout Route"), in the eastern foothills of the Rockies' Front Range at an elevation of 5,004 feet (1,525 m), 55 miles (89 km) north of Denver. The community developed after 1864 around a military outpost named for its commander, Lieutenant William O. Collins of Fort Laramie, Wyo. The outpost was abandoned in 1872, but the settlement remained and, promoted by a town development company, grew with the arrival of the railroad and a highly successful sugar beet industry based on

local irrigation and stimulated by a land grant college (now Colorado State University) established there in 1870.

The contemporary city has large lamb-feeding operations and agricultural and quarry-based industries supplemented by light manufactures and tourism. The city's Pioneer Museum preserves the first settler's cabin and mementos of the fort. Fort Collins is the headquarters of the Roosevelt National Forest, a few miles west; the Pawnee National Grassland is to the east. Inc. 1883. Pop. (1991 est.) 89,958; (1990) Fort Collins–Love-land MSA, 186,136.

Fort-Dauphin (Madagascar): see Tôlañaro.

Fort-de-France, capital of the French overseas *département* of Martinique, French West Indies. It lies on the island's west coast at the northern entrance to the large Fort-de-France Bay, at the mouth of the Madame River. The city occupies a narrow plain between the hills and the sea but is accessible by road from all parts of the island. Formerly called Fort-Royal, it has been Martinique's capital since 1680. Until 1918, when its commercial growth began, Fort-de-France had an inadequate water supply, was partly surrounded by swamps, and was notorious for yellow fever. In 1839 it was partially destroyed by earthquake and in 1890 by fire. The swamps have now been drained, and extensive suburbs have spread, particularly eastward across the Monsieur River toward Le Lamentin.

Skyline of city from Fort-de-France Bay, Martinique
© Michael S. Yamashita

Fort-de-France is the French West Indies' largest town, chief port, and busiest commercial centre and has long sheltered the French fleet in the West Indies. Sugarcane, cacao, and rum are exported. Savane, a central park, has a statue of the empress Josephine, Napoleon's wife, who was born at Trois-Îlets on the south side of the bay. There are hot springs nearby. Pop. (1990 prelim.) 100,080.

Fort Dodge, city, seat (1851) of Webster county, north-central Iowa, U.S., at the junction of the Des Moines River and Lizard Creek, 90 miles (145 km) northwest of Des

Gypsum-processing plant, Fort Dodge, Iowa
Mill and Joan Mann from CameraMann

Forsythia
J.E. Downward

Moines. It originated around Fort Clarke, which was established in 1850 and was renamed the following year for Henry Dodge, U.S. senator from Wisconsin who had fought in the Black Hawk and other Indian wars. When the fort closed in 1853, Major William Williams bought the land and buildings; he laid out the town in 1854 and became its first mayor and postmaster. The community developed as a market-processing centre for the surrounding farmlands and gypsum deposits; gypsum quarried near Fort Dodge was used in the celebrated Cardiff Giant (*q.v.*) hoax.

The city's economy now centres on the gypsum, farm machinery, and chemical fertilizer industries. Fort Dodge Historical Museum, Fort Museum, and Frontier Village have pioneer exhibits. The main campus of Iowa Central Community College (1966) is in the city. Inc. city, 1869. Pop. (1990) 25,894.

Fort Erie, town, regional municipality of Niagara, southeastern Ontario, Canada. It lies along Lake Erie and the Niagara River and is linked to Buffalo, N.Y., by the International Railway and Peace bridges. The fort, built by the British in 1764, was captured by American troops during the War of 1812. British efforts at recapture were repulsed, and the fort was abandoned (1814) and blown up. The fort was restored (1937–39) and was incorporated as a village in 1857. It became a town when it merged with Bridgeburg in 1932. Fort Erie is the site of a large horse-racing track and has steel, aircraft, automotive, paint, and pharmaceutical industries. Inc. town, 1932. Pop. (1991) 26,006.

Fort Frances, town, centre of the Rainy River district, western Ontario, Canada. It lies on the north bank of Rainy River (the Canada–U.S. boundary), opposite International Falls, Minn. Originating as a fur-trading post, Fort-Saint-Pierre, built near the present townsite in 1731, it was renamed Fort Frances in 1830 in honour of the wife of Sir George Simpson, general superintendent of the Hudson's Bay Company. The town's early growth was aided by commercial fishing and logging operations, its position on a trade route, and a canal built in the late 1870s that circumvented falls at the outlet of adjacent Rainy Lake.

A busy point of entry and the centre of a popular hunting, fishing, and canoeing area, Fort Frances remains primarily a lumbering town. Milling operations in paper, pulp, and lumber utilize hydroelectric power, which is generated nearby. Inc. 1903. Pop. (1991) 8,891.

Fort Johnston (Malaŵi): *see* Mangochi.

Fort Kent, town, Aroostook county, northern Maine, U.S. It lies at the confluence of the St. John and Fish rivers, 56 miles (90 km) north-northwest of Presque Isle. It is a port of entry linked by international bridge to Clair, N.B. (Canada). Settled in 1829 by French Acadian refugees, it was incorporated in 1869 and took its name from Fort Kent, a blockhouse built in 1839. The community developed as a potato-processing, farming, and lumbering centre. It is the terminus of U.S. Highway No. 1 from Key West, Fla., and is a gateway to the wilderness-watershed areas of northern Maine, with hunting, fishing, canoeing, and skiing facilities. The University of Maine at Fort Kent originated in 1878 as a normal school. Pop. (1990) 4,268.

Fort-Lamy (Chad): *see* N'Djamena.

Fort Lauderdale, city, seat (1915) of Broward county, southeastern Florida, U.S. It lies along the Atlantic Ocean at the mouth of the New River, 25 miles (45 km) north of Miami. A fort, built there in 1838 during the Second Seminole War and named for its commander, Major William Lauderdale, gave its name to the town, which was established in 1895 and later developed as a shipping and commercial centre and residential resort. The Atlantic Intracoastal Waterway is connected to the city's Bahia Mar Yacht Basin and to the city's deep-water port, Port Everglades, which is the deepest harbour on the U.S. Atlantic coast south of Norfolk, Va. Port Everglades is a port of entry and ranks with Jacksonville and Tampa in volume of cargo handled, largely tankerborne fuel. Fort Lauderdale itself is interlaced with recreational waterways and has extensive boating facilities, which have given rise to a busy marine industry. The city's 6 miles (10 km) of beach traditionally receives an influx of many thousands of college students during

The Atlantic Intracoastal Waterway (right) at Fort Lauderdale, Fla.

winter and spring vacations. The city's educational institutions include Broward Community College (1960), Nova University (1964), and Fort Lauderdale College (1940). Inc. city, 1911. Pop. (1992 est.) city, 155,727; (1990) Fort Lauderdale–Hollywood–Pompano Beach PMSA, 1,255,488.

Fort Lee, borough, Bergen county, northeastern New Jersey, U.S. It lies mainly along the Palisades on the west bank of the Hudson River at the west terminus of the George Washington Bridge opposite upper Manhattan, New York City. The community developed in about 1700 around Fort Constitution (later renamed Fort Lee). The Fort Lee Battle Monument marks the site of the fort, which was abandoned in 1776 after an unsuccessful attempt by General George Washington to stop the British fleet from sailing up the Hudson. The borough, now mainly residential, was from 1907 to 1919 an important centre of motion-picture production. Photographic-film processing remains one of its major industries. Inc. 1904. Pop. (1992 est.) 32,240.

Fort McHenry National Monument and Historic Shrine, site of one of the forts that successfully defended Baltimore, Md., U.S., from a British attack during the War of 1812. This event was the inspiration for Francis Scott Key's poem "The Star-Spangled Banner."

The fort, located at the entrance to the city's harbour, was built on the site of an earlier fort. It was named for James McHenry, a signer of the U.S. Constitution and secretary of war (1796–1800). After occupying Washington, D.C. (August 1814), the British sailed

up Chesapeake Bay, intent on capturing Baltimore. They bombarded Fort McHenry and other installations on September 13–14 but

Fort McHenry National Monument and Historic Shrine, Baltimore, Md.

© Tyler Campbell

did little damage to the fort and failed to capture the city. Key witnessed the battle aboard ship; at dawn on September 14 he spotted the American flag still flying over the fort, and he wrote his famous poem later that day. The fort was used as a federal prison during the American Civil War (1861–65) and subsequently served as a military post until being abandoned in 1900. It was named a national park in 1925 and was redesignated a national monument and historic shrine in 1939.

Fort Macleod, town, southwestern Alberta, Canada. It lies along the Oldman River, 32 miles (52 km) west of Lethbridge. The fort, established there in 1874 by Colonel James F. Macleod, was the first headquarters of the North West Mounted Police (now the Royal Canadian Mounted Police); it has been reconstructed as a museum. The ensuing settlement became the first town in southern Alberta and was known as Macleod until officially renamed Fort Macleod in 1952. The town's economy is based on ranching, irrigated grain farming, dairying, and coal mining. At the Belly Buttes near Stand Off (south), the Blood Indians gather annually for their traditional Sun Dance. Inc. 1892. Pop. (1991) 3,112.

Fort McMurray, formally McMURRAY, city, northeastern Alberta, Canada, at the confluence of the Athabasca and Clearwater rivers. It originated as a North West Company fur-trading post (1790) known as Fort of the Forks, which was taken over by the Hudson's Bay Company (1821). Rebuilt in 1875, it was renamed Fort McMurray after a company factor, William McMurray. A gateway to the northwestern Canadian wilderness, the city has an airport and is connected by rail and highway with Edmonton, 270 miles (435 km) southwest. The city lies at the southern limit of navigation on the Mackenzie River–Great Slave Lake network, and the city is a busy port and transshipment centre in the summer months. To the north oil is extracted from the Athabasca Tar Sands. Fort McMurray is the seat of Keyano College. Inc. town, 1948; city, 1980. Pop. (1991) 34,706.

Fort Matanzas National Monument, Spanish fort, on Rattlesnake Island, 14 miles (23 km) south of St. Augustine, Fla., U.S. Originating in 1569 as a wooden tower and completed in 1742, the fort is near the site of the slaughter of 300 French Huguenots by Spaniards under Pedro Menéndez de Avilés in 1565.

Fort Morgan, city, seat (1889) of Morgan county, northeastern Colorado, U.S., on a low plateau overlooking the South Platte River, 70 miles (113 km) northeast of Denver at an elevation of 4,240 feet (1,292 m). The site, on the Overland Trail, was originally occupied by a fort (established in 1864 and named for an American Civil War colonel, Christopher

A. Morgan). The fort was abandoned in 1868, but the adjacent settlement prospered and developed as a processing and shipping centre for local produce including livestock, dairy products, sugar beets, potatoes, beans, corn (maize), alfalfa, and small grain. After 1950, oil was exploited in the nearby Julesburg Oil Basin, and refineries became economically significant. Local manufactures include hand tools, irrigation pipes, and concrete products. Morgan Community College was founded in 1967. Pawnee National Grassland is to the north. Inc. town, 1887; city, 1908. Pop. (1990) 9,068.

Fort Myers, city, seat (1887) of Lee county, southwestern Florida, U.S., on the broad Caloosahatchee River, 120 miles (193 km) south-southeast of Tampa. In 1839 a fort, later named for General Abraham Myers, was built to protect settlers from Seminole Indian raids. The city is the western terminus of the cross-state Okeechobee Waterway, linking the Atlantic Ocean and the Gulf of Mexico, and has a modest tourist trade. Largely dependent on agriculture, including citrus fruits and cattle, Fort Myers is the centre of a large-scale gladiolus and chrysanthemum industry and is the

Fields of gladiolus near Fort Myers, Fla.

Shostal Assoc

site of several large city housing developments for retirees. The winter home and laboratory of the inventor Thomas A. Edison is preserved as a museum, and the city holds an annual Pageant of Light (February) as a tribute to the inventor. The community college (1962) was also named after him.

Fort Myers Beach on Estero Island, a narrow crescent 7 miles (11 km) long between Estero Bay and the gulf, is 15 miles (24 km) south of Fort Myers. Inc. 1905. Pop. (1992 est.) city, 47,127; Fort Myers-Cape Coral MSA, 349,357.

Fort Payne, city, seat (1842) of DeKalb county, northeastern Alabama, U.S., in Big Wills Valley between Lookout and Sand mountains. Founded in 1836, it was named for Captain John Payne, a government agent involved in the forced removal of the Cherokee to the West. It was incorporated in 1889, during a mining boom (1889-92). Subsequently, agriculture, light industries, and tourism became the economic mainstays. Within the city is Manitou Cave, noted for its stalagmites and fossils. Nearby are Desoto State Park and the site of Will's Town, an Indian village where Sequoyah devised (1809) the Cherokee alphabet. Pop. (1992 est.) 12,116.

Fort Peck Dam, dam on the Missouri River, northeastern Montana, U.S. A Public Works Administration project completed in 1937, it provides flood control, improved navigation, and hydroelectric power. One of the world's largest earth-fill dams, it is 249 feet (76 m) high and 21,432 feet (6,534 m) long.

Fort Pierce, city, seat (1905) of St. Lucie county, southeastern Florida, U.S., on the In-

dian River (a lagoon connected to the Atlantic Ocean by inlets), 58 miles (93 km) north of West Palm Beach. The fort, built (1838-42) during the Seminole Wars, was named for Major (later Lieutenant Colonel) Benjamin K. Pierce (brother of President Franklin Pierce), who commanded a detachment. Permanent white settlement began in the 1860s around the fort site, and two fishing villages, Cantown and Edgartown, were established. In 1901 the three communities were merged and incorporated as the City of Fort Pierce. The federally maintained Port of Fort Pierce is on the Atlantic Intracoastal Waterway. Commercial fishing, including shrimp, is significant, while the annual Sandy Shoes Festival (January) spotlights the cattle industry, agriculture, citrus groves, and recreation.

The city is the site of Indian River Community College (founded 1960), which merged with Lincoln Junior College in 1965. Since 1959 salvaging operations offshore have yielded large quantities of gold and silver coins, bullion, artifacts, and relics from a sunken Spanish "Silver Fleet," lost in 1715 during a hurricane. Pop. (1992 est.) city, 38,395; Fort Pierce-Port St. Lucie MSA, 261,737.

Fort Pillow Massacre (April 12, 1864), in the American Civil War, Confederate slaughter of black Federal troops stationed at Fort Pillow, Tenn. The action stemmed from Southern outrage at the North's use of black soldiers. From the beginning of hostilities, the Confederate leadership was faced with the question of whether to treat black soldiers captured in battle as slaves in insurrection or, as the Union insisted, as prisoners of war. In 1864 Confederate Colonel W.P. Shingler ordered those in his command to take no more black prisoners.

In what proved the ugliest racial incident of the war, Confederate forces under General Nathan B. Forrest captured Fort Pillow on April 12, 1864, and proceeded to wipe out the black troops within; some were burned or buried alive. A Federal congressional investigating committee subsequently verified that more than 300 blacks, including women and children, had been slain after the fort surrendered. After the incident, black soldiers going into battle used the cry "Remember Fort Pillow!" Later in the year, the South agreed to treat blacks as prisoners of war.

Fort Portal, town, western Uganda, situated at an elevation of about 5,000 feet (1,500 m) and overlooking the mountains of the Ruwenzori Range and the Mufumbiro volcanoes. Roads link it with Rubona, Kyenjojo, and Kyegegwa. It is an important market and processing centre for cotton, peanuts (groundnuts), sesame, corn (maize), coffee, tobacco, castor-oil seeds, tea, tropical fruits, and vegetables. A number of tea estates are concentrated east of the town. Fort Portal provides a base for mountaineering in the Ruwenzori Range and has the palace of the *omukama* ("king") of Toro. The Bwamba Pass, the Hot Springs of Bundibugyo, and the Ileri Forest are nearby points of interest. Pop. (1991 prelim.) 32,627.

Fort Qu'Appelle, also called the FORT, town, southeastern Saskatchewan, Canada, on The Fishing Lakes of the Qu'Appelle River, surrounded by Indian reservations, 45 miles (72 km) east-northeast of Regina. It originated in 1864 as a Hudson's Bay Company fur-trading post, and an 1874 treaty whereby the Cree and Saulteaux Indians conceded a large portion of southern Saskatchewan to the white settlers was signed there. The completion of a survey in 1882 marked the beginning of settlement by a predominantly eastern Canadian (Anglo-Saxon) population. The town, named for the Qu'Appelle River, is a noted fur-farming centre and a market for a mixed-farming area. It is also the centre of a lake resort region and is the site of a provincial fish hatchery.

Adjoining the local museum is an original log building of the Hudson's Bay Company. Inc. village, 1898; town, 1951. Pop. (1991) 1,953.

Fort Rixon, village, south-central Zimbabwe. It was founded as a British military post in 1896 during the Ndebele uprisings near the site of the Dhlo-Dhlo ruins. Prominent in local tradition, the ruins appear to be of 17th- or 18th-century origin, yielding Portuguese, Arab, and Jesuit relics. It is believed that Dhlo-Dhlo was a seat of the supreme chief of the Rozwi people before the arrival of the Ndebele. It is now an agricultural (corn [maize] and tobacco) and ranching centre and the focus of gold-mining activities in the area.

Fort Rosebery (Zambia): see Mansa.

Fort-Rupert, formerly RUPERT HOUSE, also called WASKAGANISH, village and trading post in Nord-du-Québec region, western Quebec province, Canada, on James Bay, at the mouth of the Rupert River. Founded in 1668 as the first Hudson's Bay Company post by the Médart Chouart, sieur de Groseilliers, it was at first called Fort-Charles and was the first European settlement in northern Canada. The fort was captured by the French in 1686 and remained under their control until 1713, during which period it was called Fort-Saint-Jacques. In 1777 the company post was reestablished, and it has been in operation ever since. Inc. village, 1978. Pop. (1991) 1,344.

Articles are alphabetized word by word,
not letter by letter

Fort Saint James, village, central British Columbia, Canada, on the southeastern shore of Stuart Lake at the confluence of the Stuart and Necoslie rivers, 70 miles (113 km) northwest of Prince George. One of the province's oldest communities, it originated as a trading post, established in 1806 by Simon Fraser and John Stuart for the North West Company. In 1821 it was taken over by the Hudson's Bay Company (when the two companies amalgamated) and made capital of the interior fur-trading district of New Caledonia (the forerunner of British Columbia). A Roman Catholic mission was founded there in 1842 by Bishop Modeste Demers. With the creation of the British Columbia colony in 1858, Fort Saint James lost its position as a centre of local government. The old fort buildings and a museum are preserved within a national historic park, and the mission church is still in use. The Necoslie Indian Reservation is adjacent to the village, which now serves as a supply base for prospectors, hunters, trappers, and fishermen. Lumbering and mining are local activities. Inc. 1952. Pop. (1991) 2,058.

Fort Saint John, city, northeastern British Columbia, Canada, just north of the Peace River, 45 miles (73 km) northwest of Dawson Creek. It originated with the building of a North West Company fort on the river's north bank in 1805. The Hudson's Bay Company assumed control in 1821; two years later the fort was destroyed in an Indian attack. Rebuilt in 1860 on the south bank of the river, it has since moved several times. The present fort, built at the beginning of the Sikanny Trail in 1925, formed the nucleus of the community of Fort Saint John, which was incorporated as a village in 1947. A service centre for a wide agricultural area, it expanded after the construction (1943) of the suspension bridge across the Peace River at Taylor and the completion of the Alaska Highway during World War II. The discovery nearby of vast oil and gas deposits has made Fort Saint John the oil capital of British Columbia. Inc. town, 1958; city, 1975. Pop. (1991) 14,156.

Fort Sandeman (Pakistan): *see* Zhob.

Fort Scott, city, seat of Bourbon county, southeastern Kansas, U.S., on the Marmaton River near the Missouri border. The community grew up around a military outpost (1842) named for General Winfield Scott. After removal of the garrison (1855), Fort Scott was the scene of clashes between proslavery and antislavery factions. Some of the buildings erected during the American Civil War (1861–65), when the fort was reactivated, remain. Fort Scott is now a railroad junction and a shipping point in a diversified farming area. Work clothes, cement, aluminum products, business forms, and calendars are made. Fort Scott Community College was established in 1919. Inc. 1860. Pop. (1990) 8,362.

Fort Smith, southwestern region of the Northwest Territories, Canada. Formerly part of MacKenzie district, Fort Smith region was created in the early 1970s by the territorial government. The region extends northward from the Alberta border to encompass Great Slave Lake and the eastern portion of Great Bear Lake and stretches eastward from the Yukon border to the upper branches of the Thelon River, north of central Saskatchewan. Largely a transition zone between boreal coniferous forest and Arctic tundra, it is characterized by the southern Mackenzie Mountains (west), the lowlands of the northward-flowing Mackenzie River (centre), and plateau and plains (east). Fort Smith region is the most populous and productive part of the Territories; its chief settlements, including Yellowknife (capital of the Northwest Territories), Hay River, and Fort Smith (the regional headquarters), are important mining towns. Fur trapping, lumbering, and tourism are other economic activities. American Indians (including Athabaskan-speaking Slave and Dogrib and some Algonquian-speaking Cree) and métis (people of mixed Indian and French or Scottish ancestry) constitute about one-fourth of the region's population. Pop. (1991) 27,553.

Fort Smith, town, southern Fort Smith region, Northwest Territories, Canada, on the Slave River, at the Alberta border. It lies below the rapids, midway between Lake Athabasca and Great Slave Lake. The settlement originated in 1874 as a Hudson's Bay Company post and portage point and was named for Donald A. Smith (governor of the company), who later became Lord Strathcona. Fort Smith was the territorial administrative centre from 1911 until Yellowknife became the territorial capital in 1967. Fort Smith remains a regional government centre, is headquarters of nearby Wood Buffalo National Park, and is economically dependent on trapping and tourism. Two portage roads connect the town to Fitzgerald, Alta. (bypassing the Slave River rapids), and an all-weather highway links it with Hay River, on Great Slave Lake, 140 miles (225 km) to the northwest. Inc. 1967. Pop. (1991) 2,480.

Fort Smith, city, northern district seat (1852) of Sebastian county, western Arkansas, U.S., on the Arkansas River at the Oklahoma state line. An army fort, established on the site (known as Belle Point to early French explorers) in 1817, was named for General Thomas A. Smith. The town was laid out in 1821, and its growth was sustained with the arrival of the railroad (1876). The U.S. Federal District Court for Western Arkansas was located in Fort Smith and had jurisdiction over the Indian Territory (now Oklahoma), which also was a refuge for outlaws. Judge Isaac C. Parker, known as a "hanging judge," successfully carried out the difficult task of enforcing federal law from 1875 to 1896. His courtroom has been restored as part of the Fort Smith

Judge Parker's courtroom, Fort Smith, Ark.
William R. Wilson—FPG

National Historic Site. Fort Smith is in the centre of an expanding industrial area (coal and natural-gas fields) and is one of the state's leading manufacturing cities. Westark Community College (1928) is located there. Inc. town, 1842; city, 1851. Pop. (1992 est.) city, 74,291; Fort Smith MSA, 179,528.

Fort Stanwix, Treaties of (1768, 1784), cession by the Iroquois League of land in what are now western Pennsylvania, Kentucky, West Virginia, and New York, opening vast tracts of territory west of the Appalachian Mountains to white exploitation and settlement. Soon after the Proclamation of 1763 (*see* 1763, Proclamation of), which followed the last French and Indian War, British authorities recognized that the western boundary drawn at that time was unacceptable to land-hungry white settlers and ambitious fur traders. Some 3,400 Iroquois Indians gathered in November 1768 at Fort Stanwix (now Rome), N.Y., to sign a new treaty with British government agents; they ceded land south and east of a line running from Fort Stanwix south to the Delaware River, west and south to the Allegheny River, and downstream to the confluence of the Ohio and Tennessee rivers.

The southern portion of this cession was in fact beyond Iroquois territory, and the British negotiated additional agreements with the Cherokee verifying the new boundaries in what is now West Virginia at the Treaty of Hard Labor (October 1768) and the Treaty of Lochaber (October 1770). These three treaties launched a new period of eager land speculation for whites, accompanied by a stream of homesteaders who quickly poured into the Ohio River region.

The Second Treaty of Fort Stanwix (also called the Treaty with the Six Nations) came after the U.S. War of Independence, during which the powerful Iroquois had been considerably weakened by the American frontier campaign. The Iroquois reluctantly agreed to redraw their eastern boundaries established in 1768. At Fort Stanwix (October 1784), they were persuaded to yield, in addition to a small section of western New York, a vast region in western Pennsylvania, representing one-fourth the total area of the modern state. Iroquois relinquishment of claims to additional territory west of the Ohio was disputed by adjacent tribes, however, especially the Shawnee, leading to misunderstanding and bloodshed in that area for years to come.

Fort Stanwix National Monument, a reconstruction of the original fort, commemorates the two treaties and also the stand American forces took there in August 1777 against the British invading from Canada during the War of Independence.

Fort Sumter National Monument, site of the first engagement of the American Civil War, April 12, 1861, located on Sullivan's Island at the entrance to the harbour of Charleston, S.C. Construction of the fort (named for Thomas Sumter, a Revolutionary War patriot) began in 1829 and was still in

progress in 1861. The national monument, established in 1948, also includes Fort Moultrie. Located on the mainland, Fort Moultrie was the site of an American victory against the British (June 28, 1776) in the U.S. War of Independence, when the fort was called Fort Sullivan. The Seminole Indian leader Osceola is buried there.

By early 1861, the seven Southern states that had already seceded from the Union claimed possession of all U.S. forts and arsenals within their territory. Only two forts remained under federal jurisdiction: Fort Pickens, Fla., and Fort Sumter, which was garrisoned by U.S. troops under Major Robert Anderson. Sumter was of no strategic value to the Union; it was incomplete, and its 60 guns pointed out to sea, but it assumed critical value as a symbol of national union. When President Abraham Lincoln took office in March, he was faced with the Confederate demand for evacuation of the fort, which was threatened by other fortifications erected by South Carolina in the harbour area. Lincoln had either to attempt resupplying the fort, then in danger of being starved out, or abandoning it and acceding to disunion. The president determined to prepare relief expeditions to both forts; but, before the arrival of supplies, Confederate authorities demanded Fort Sumter's immediate evacuation. When this was refused, the South's batteries opened fire at dawn on April 12, and the fort was surrendered two days later. The shelling of U.S. property aroused and united the North.

Fort Union National Monument, site of three successive forts built (1851–63) by the U.S. Army near Watrous, N.M., about 60 miles (97 km) east-northeast of Santa Fe. The fort, at a junction of two branches of the Santa Fe Trail, was an important supply depot; it was abandoned in 1891. The site was designated a national monument in 1954.

Fort Valley, city, seat of Peach county, central Georgia, U.S., just west of Warner Robins and Robins Air Force Base. Settled about 1836, the community developed after the railroad arrived in 1851 as a shipping and canning centre for an extensive peach-growing area. The city also has some light industry. Fort Valley State College was established there in 1895 as a high school for blacks. Inc. 1856. Pop. (1990) 8,198.

Fort Victoria (town, Zimbabwe): *see* Masvingo.

Fort Walton Beach, city, Okaloosa county, northwestern Florida, U.S., at the western end of Choctawhatchee Bay (off the Gulf of Mexico), separated from the Santa Rosa Island beaches by Santa Rosa Sound, 40 miles (64 km) east of Pensacola. The fort was established during the Seminole Wars and named for Colonel George Walton, territorial secretary of West Florida (1821–22) and East-West Florida (1822–26). The fishing village that grew around the fort evolved in the 1920s as a yachting centre. Created the Municipality of Fort Walton in 1937, it was reincorporated (1941) as a town and was rechartered in 1947 and again in 1953, when it was renamed the City of Fort Walton Beach. After 1950 it developed as a residential resort. A pre-Columbian Indian Temple Mound and Museum are there. The campus of Okaloosa-Walton Community College (1963) is at nearby Niceville. Pop. (1992 est.) city, 22,383; Fort Walton Beach MSA, 149,885.

Fort Wayne, city, seat (1824) of Allen county, northeastern Indiana, U.S., at the confluence of the St. Marys and St. Joseph rivers where they form the Maumee River, 118 miles (190 km) northeast of Indianapolis. The waters, spanned by 21 bridges, divide the town into three parts. The place was prominent in frontier history. In the late 17th century the French built a trading post (later fort) at this

natural stronghold on the site of Kekionga, once the chief town of the Miami Indians. It was attacked and taken by the English (1760) and then by Indians under Pontiac (1763). A log stockade constructed in 1794 by General Anthony Wayne after the Battle of Fallen Timbers, near what is now Toledo, Ohio (reconstructed 1975), gave the town its name.

Fort Wayne's industrial growth began with the building of the Wabash and Erie Canal in the 1830s and was stimulated in the 1850s when the railway came. The town's easy access to raw materials and markets has encouraged the manufacture of a wide range of machinery, including automotive and electrical equipment and parts and diamond-set cutting tools. Fort Wayne is noted as a centre of higher learning, its institutions including Concordia Theological Seminary (1846), Indiana Institute of Technology (1930), Indiana University–Purdue University at Fort Wayne (1917), and St. Francis College (1890). The Lincoln National Life Foundation houses a large collection of Abraham Lincoln memorabilia.

John Chapman (Johnny Appleseed), the pioneer orchard planter, is buried near the War Memorial Coliseum. Inc. town, 1829; city, 1840. Pop. (2000) city, 205,727; Fort Wayne MSA, 502,141.

Fort William, town, Ontario, Can., that merged with the town of Port Arthur in 1970 to form the city of Thunder Bay (*q.v.*).

Fort William, small burgh in Lochaber district, Highland region, Scotland. It lies at the northeastern end of Loch Linnhe and at the foot of Ben Nevis, which is Britain's highest mountain. The original fort, built in 1654 to keep the peace in the Highlands, was later ruined and, in 1690, rebuilt and named for the British monarch William III. The fort was dismantled in the 19th century to make room for the railway. Fort William was the first town in Britain to light its streets entirely by hydroelectricity. Water from Loch Treig, conveyed by a 15-mile (24-kilometre) tunnel beneath Ben Nevis, provides power for an aluminum works. Other industries include cattle raising and distilling. Pop. (1991) 10,391.

Fort Worth, city, seat of Tarrant county, northern Texas, U.S. It lies at the confluence of the Clear and West forks of the Trinity River and constitutes the western part of the Dallas–Grand Prairie–Arlington–Fort Worth urban complex. Founded in 1849 by Major Ripley Arnold as a military outpost (although it was never a fort) against Comanche Indian raids, it was named for Major General William J. Worth, commander of U.S. troops in Texas at the time. After the army left in 1853, the town languished, but it revived in 1856 when, by popular vote, it displaced neighbouring Birdville as the county seat.

A stopover point for longhorn cattle drives on the Chisholm Trail in the early 1870s, Fort Worth became a cattle-shipping boomtown after the Texas and Pacific Railway arrived in 1876. Fort Worth subsequently became the meat-packing centre of the American Southwest. Oil finds brought the petroleum-refining industry to the city in 1920, and in 1949 aircraft manufacturing began there.

The city's economy, integrated with that of Dallas, is widely based. Its diversified industry includes the manufacture of aircraft and aerospace and electronic equipment and machinery. While still a cattle industry headquarters, Fort Worth is also a food-processing, transportation, and wholesaling centre, and its oil business has remained vigorous.

It is the seat of Texas Christian University (1873), Texas Wesleyan University (1890), and Tarrant County Junior College (1967); the University of Texas at Arlington (1895) is just to the east. The city's Will Rogers Memorial

Center embraces the Amon Carter Museum of Western Art (1961; housing a fine collection of paintings of the American West—notably those of Frederic Remington and Charles Russell) and the unique Kimbell Art Museum, built with semicircular vaults. The Tarrant County Convention Center (1968), spanning 14 downtown city blocks, is a major landmark. Recreational and other attractions include a zoo and aquarium, botanical gardens, several recreational lakes, and the combined Southwestern Exposition, Livestock Show and Rodeo (held in January). Inc. 1873. Pop. (2000) city, 534,964; Fort Worth–Arlington PMSA, 1,702,625.

Fort Worth Zoological Park and James R. Record Aquarium, municipally owned zoo and aquarium in Fort Worth, Texas, U.S. Opened in 1923, the 15-hectare (37-acre) zoo exhibits more than 2,000 specimens of some 500 species. The zoo's herpetarium has a large collection of reptiles and has bred, such endangered species as the bog turtle. The zoo also is noted for its collection of tropical birds.

The James R. Record Aquarium was opened in 1954 as an extension of the zoo. Its collection contains more than 3,000 specimens of 320 fishes and other aquatic species. A notable feature of the aquarium is its geographic presentation of various fish groups, which shows the species most likely to be found in a particular region of the United States or the world.

Fortaleza, port city and capital, Ceará *estado* ("state"), northeastern Brazil. The city lies at the mouth of the Pajeú River on a crescent-shaped indentation of the coastline. It originated as a small village adjoining a Portuguese fort (built as a defense against Indian attacks) and took the name of Villa do Forte da Assumpção in 1654. In 1810 it became the capital of Ceará captaincy and in 1823 was given city status and became the provincial (later state) capital under the name of Fortaleza Nova de Bragança.

The city has a modern appearance with wide avenues. Its harbour, long an open roadstead, has been protected and greatly improved by construction of a breakwater with port facilities at Mucuripe Point, 4 miles (6 km) to the east. The port's exports include sugar, coffee, cashews, lobsters, salt, rubber, cotton, carnauba wax, oiticica oil, rum, rice, *feijão* (beans), fruits, hides, and skins. Fortaleza's factories produce dyes, electroceramics, and styrofoam packing materials. Marine algae is processed there for use in fertilizers, stock feed,

Downtown Fortaleza, Braz.

Carl Frank—Photo Researchers

agar, and carrageenan. Highways link Fortaleza with Sobral, Recife, and Pernambuco. The Baturité Railway connects Fortaleza and its port with fertile regions to the southwest and extends southeast to Patos, in Paraíba state.

Fortaleza is the seat of a bishopric (created in 1854) and of the State University of Ceará (1975) and the University of Fortaleza (1973). Pop. (2000 prelim.) 2,138,234.

Fortas, Abe (b. June 19, 1910, Memphis, Tenn., U.S.—d. April 6, 1982, Washington, D.C.), lawyer and associate justice of the United States Supreme Court (1965–69).

Nominated chief justice in 1968, he became the first nominee for that post since 1795 to fail to receive Senate approval. The following year he became the first Supreme Court justice to resign under threat of impeachment.

Fortas' father, an Orthodox Jew, had immigrated to the United States from England. Fortas graduated from Yale Law School in 1933, first in his class. A protégé of future justice William O. Douglas—who was then teaching law at Yale—he remained there as assistant professor of law until 1937, when he followed Douglas to the federal Securities and Exchange Commission. Fortas held a number of government posts before entering private law practice in 1946. The law firm that he co-founded represented the Washington interests of many of the country's largest corporations. In 1963 Fortas successfully argued before the U.S. Supreme Court the case of *Gideon v. Wainwright*, which established the right of the accused in criminal trials to counsel, regardless of ability to pay.

President Lyndon Johnson nominated Fortas, an old and trusted friend, to the Supreme Court in 1965. Three years later he nominated him to replace retiring Chief Justice Earl Warren. Fortas generally had sided with the liberal court majority, and his nomination was quickly assailed by various critics. When the nomination came to the Senate floor, a filibuster ensued. Shortly afterward, Fortas requested that his name be withdrawn, and the president complied. In 1969, Fortas' earlier financial involvement with a financier who was subsequently imprisoned for securities violations appeared likely to precipitate impeachment proceedings in Congress; in May Fortas resigned, returning to private practice.

Fortes, Meyer (b. April 25, 1906, Britstown, Cape Province, S.Af.—d. Jan. 27, 1983, Cambridge, Cambridgeshire, Eng.), British social anthropologist known for his investigations of West African societies.

After studying at the University of Cape Town in South Africa, Fortes received his Ph.D. in psychology from the London School of Economics and Political Science in 1930. In 1932 he turned from psychology to anthropology and studied under Bronislaw Malinowski at the London School. During 1934–37 he worked in Ghana and, upon his return, was appointed lecturer in social anthropology at the London School. Subsequently, he was appointed research lecturer in African sociology at the University of Oxford. He was professor of social anthropology at King's College, Cambridge, from 1950 to 1973.

Fortes's special interests were the political anthropology and kinship systems of various African peoples, especially the Tallensi. Most of his studies were conducted in nations along the Guinea coast of Africa. Among his major works are *The Dynamics of Clanship Among the Tallensi* (1945), *The Web of Kinship Among the Tallensi* (1949), *Kinship and Social Order* (1969), and *Time and Social Structure, and Other Essays* (1970).

Fortescue, Sir John (b. c. 1385, Norris, Somerset, Eng.—d. c. 1479, Ebrington, Gloucestershire), jurist, notable for a legal treatise, *De laudibus legum Angliae* (c. 1470; "In Praise of the Laws of England"), written for the instruction of Edward, prince of Wales, son of the deposed king Henry VI of England. He also stated a moral principle that remains basic to the Anglo-American jury system: It

is better that the guilty escape than that the innocent be punished.

Fortescue became chief justice of the King's Bench in 1442 and was knighted the following year. After the defeat of Henry VI's Lancastrian army at Towton, Yorkshire (March 29, 1461), he fled with Henry to Scotland, where Fortescue probably was appointed lord chancellor of the exiled government. From 1463 to 1471 he lived in France at the court of Henry's queen, Margaret of Anjou, where he helped to educate Prince Edward to rule England in the event of a Lancastrian restoration. Returning to England, he was captured at Tewkesbury, Gloucestershire, during the final defeat of the Lancastrians (May 4, 1471), submitted to the Yorkist king Edward IV, and was allowed to retire to his home.

Unusual for its time, *De laudibus* depreciates the Roman-derived civil law and eulogizes the English constitution, statutes, and system of legal education, while offering suggestions for reform. It was probably the first book about law written in a style so simple and lucid as to be comprehensible to the layman.

Forth, Patrick Ruthven, Earl of, EARL OF BRENTFORD, LORD RUTHVEN OF ETRICK (b. c. 1573—d. Feb. 2, 1651, Dundee, Scot.), supreme commander of the Royalist forces of Charles I during the early phases of the English Civil Wars.

A descendant of the 1st Lord Ruthven (d. 1528) in a collateral line, he distinguished himself in the service of Sweden, which he entered about 1606. As a negotiator he was very useful to Gustavus Adolphus because of his ability to "drink immeasurably and preserve his understanding to the last," and he also won fame on the field of battle. Having taken part in the Thirty Years' War and been governor of Ulm, he left the Swedish service and returned to Scotland, where he was employed by Charles I. He defended Edinburgh Castle for the king in 1640, and, when the first Civil War broke out, he joined Charles at Shrewsbury. He led the left wing at the Battle of Edgehill (October 1642) and, after this engagement, was appointed general in chief of the Royalist army. For his services he was created Lord Ruthven of Etrick in 1639, Earl of Forth in 1642, and Earl of Brentford in 1644. The earl compelled the Earl of Essex to surrender Lostwithiel and was wounded at both battles of Newbury. But his faculties had begun to decay, and in 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II, Brentford died at Dundee. He left no sons, and his titles became extinct.

Forth, River, river and estuary in eastern Scotland, flowing from west to east from its headwaters on the eastern slopes of Ben Lomond to the Firth of Forth (the estuary), near Kincardine. The river has a short highland section and a longer lowland section, falling only 80 feet (25 m) in 55 miles (90 km). This stretch, called the Links of Forth, was the site of the famous Battle of Bannockburn, fought in 1314, during which English troops suffered a major defeat at Scottish hands. Near its tidal limit at Stirling, the Forth receives two important left-bank tributaries, the Allan and Teith. The Forth-Clyde Canal, completed in 1790, is now disused.

The firth stretches for 48 miles (77 km) from Kincardine (bridged in 1936) to the Isle of May, with a constriction at North and South Queensferry, which is spanned by the railway Forth Bridge (1890) and the Forth Road Bridge (1964).

Forth Bridge, railway bridge over the Firth of Forth, the estuary of the River Forth in Scotland. It was one of the first cantilever

bridges and for several years was the world's longest span. Designed and built by Benjamin Baker in the late 1880s, its opening stirred controversy on aesthetic grounds, the poet and artist William Morris declaring it "the supremest specimen of all ugliness," a judgment greatly softened by the passage of time.

Forth railway bridge, Scotland
A.F. Kersting

Making use of the rocky isle of Inchgarvie in the middle of the deep firth as a foundation for one of three giant (1,350-foot [411-metre]) cantilevers (projecting members supported at only one end), Baker joined the cantilevers together with two suspended spans of 350 feet (107 m) each, making a total of 1,700 feet (518 m) of clear spans over either arm of the firth. The 12-foot- (4-metre-) diameter tubes forming the cantilevers, the roadway, and approach spans consumed the hitherto unheard-of quantity of 58,000 tons of steel. The cost of the bridge, extraordinary for its day, was £3,000,000 (about \$15,000,000).

The Forth Road Bridge, completed in 1964, is a suspension structure with a main span of 3,300 feet (1,000 m).

Forth River, river in northern Tasmania, Australia, rising in the lakes district near Mount Pelion West in the Central Plateau. Fed by its principal tributaries, the Dove and Wilmot, it flows 60 miles (95 km) north to Port Fenton, its estuarine mouth on Bass Strait. Falling steeply over the plateau edge to the agricultural coastal plain, it is the central river of the Mersey-Forth power project. Water from Lake Mackenzie on the Fisher River and Rowallan Dam on the Mersey River is diverted west to the Forth above Lemonhyme power station. Downstream, a diversion tunnel enters from the Wilmot River (west). The combined flow is then impounded behind several dams, including the Cethana, Devils Gate, and Paloona. The total power generated exceeds 300,000 kilowatts.

fortification, in military science, works erected to strengthen a position against attack.

A brief treatment of fortification follows. For full treatment, see MACROPAEDIA: War, The Technology of.

Permanent fortifications include lasting forts and troop shelters; they are usually constructed of masonry, concrete, or stone. Field fortifications are those constructed when in contact with an enemy or when contact is imminent. They consist of entrenched positions for personnel, weapon emplacements, cleared fields of fire for weapons, and manufactured obstacles such as mines and barbed wire; and they also include the strengthening of available natural obstacles by utilizing felled trees, rocks, and other materials.

There are two chief reasons for fortifications: to obtain the greatest advantage from one's own strength and weapons and to prevent the enemy from using his resources to advantage. The defender is shielded by the protecting fortification, and the attacker is delayed or his impetus minimized by obstacles.

The defense of cities and trade centres, usually by high walls, has been important for centuries as a protection for their wealth. Permanent fortifications have also been established at strategic points along routes of invasion. Seacoast fortifications have normally been for protection against naval attack, though from a

military standpoint they sometimes included protection from the land side. Field fortifications have been used in varying degrees since the time of the Greeks and the Romans. The citadel was the municipal fortress of the ancient world. It appeared in cities of Egypt, Greece, and the Roman Empire.

Obstacles have been utilized throughout history to prevent an enemy from coming to close quarters. The Romans depended upon protective walls and dry ditches in the republican era but later utilized ditches filled with water and spiked tree trunks set in the ground. Obstacles were of little value unless they were tied into the defense system. For instance, the concrete dragon's teeth of the German west wall of World War II were an inconsequential obstacle when no troops or defense guns were nearby. Bulldozers merely pushed dirt over them to create an elevated road, or engineers dynamited a path through them.

In ancient days, fortifications hindered the best attacking troops for months and even years. The medieval castle was almost impregnable until gunpowder gave artillery increased battering power. Even against artillery, the fortifications of World War I were able for a time to bear up successfully. In World War II new methods of combined attack made even the strongest permanent fortifications vulnerable. Field fortifications gave some help to the defense by channelizing enemy attacks, though at no time were they impregnable.

Historically, both permanent and field fortifications were strong against hand weapons and engines of war but required extensive modification after the arrival of gunpowder. In the age of the tank and airplane, permanent fortifications became inadequate, but field fortifications were able to compel some delay in enemy advances.

Fortin Ingavi (Paraguay): see Mayor Pablo Lagerenza.

Fortis, Alessandro (b. 1842, Forlì, Papal States [Italy]—d. Dec. 4, 1909, Rome), statesman, of strong republican views during the Risorgimento, the 19th-century unification of Italy. Later, under the monarchy, he held several governmental posts, including that of premier (1905-06).

Fortis fought as a volunteer with Giuseppe Garibaldi in 1866 and 1867. After the unification of Italy as a monarchy, he remained an ardent republican and was arrested on Aug. 2, 1874, for conspiring with the socialists to foment insurrection but was released five months later. In 1876 he urged the republicans to begin participating in the government. Elected a deputy in 1880, he drifted

to the right politically. He served as minister of agriculture (June 1898–May 1899), and, when Giovanni Giolitti resigned as premier (February 1905), he named Fortis as his successor. Because he was considered Giolitti's pawn, Fortis had difficulty forming a government. In office he settled a rail strike by declaring railway workers to be civil servants who were not allowed to strike. He nationalized the railways and in so doing offered an exorbitant sum to the railway companies and was accused of corruption. His foreign policy favouring the Triple Alliance was also unpopular. Finally, by reducing import duties on Spanish wine, he aroused opposition that toppled his government in February 1906.

Fortner, Wolfgang (b. Oct. 12, 1907, Leipzig, Ger.—d. Sept. 11, 1987, Heidelberg, W.Ger.), progressive composer and influential music teacher in Germany.

Fortner studied music and philosophy at the Leipzig Conservatory and the University of Leipzig, and at the age of 24 he went to Heidelberg as professor at the Institute for Evangelical Church Music. He later taught in Detmold and in Freiburg im Breisgau.

Besides concerti, orchestral works, chamber and church music, Fortner composed distinguished operas and music for the stage. His choral works and solo instrumental pieces also enjoyed success, especially in Germany. His early style was held to be much influenced by Baroque music; it is highly contrapuntal and melodically severe. Later his music expanded in emotional scope and power. The *Symphony* (1947), an aggressive, poignant work, exemplifies the composer's maturity. Its four movements abound in contrapuntal complexities, the resulting musical texture being harmonically and rhythmically very intense. The *Phantasie über B-A-C-H* for two pianos, nine solo instruments, and orchestra (1950) displays Fortner's skill with 12-tone technique. In the *Phantasie*, Arnold Schoenberg's original 12-tone system is modified to fit Fortner's virtuosic conception. Fortner's operas include two works based on plays by Federico Garcia Lorca: *Die Bluthochzeit* (*Blood Wedding*, first performed, 1957; incidental music to the same play, 1950) and *In seinem Garten liebt Don Perlimplin Belisa* (1962; *In His Garden Don Perlimplin Belisa Loves*).

Fortnum & Mason, Ltd., in London, department store that began as a grocery shop in 1707 and became famous for the variety and high quality of its food products. The store took on other lines of goods in the 1920s, opening new departments featuring fashionable clothes and other products. Stressing quality and serving the fashionable London carriage trade, Fortnum & Mason continued to devote its first floor to groceries, fresh fruit and flowers, and beverages.

Although the store has expanded considerably, its trademark remains its foodstuffs of high quality and variety. Its exotic delicacies are world-renowned. The famous Fortnum & Mason outdoor clock chimes the hours while figures representing William Fortnum and Hugh Mason, the founders, appear and bow to one another.

Fortuna, in Roman religion, goddess of chance or lot who became identified with the Greek Tyche; the original Italian deity was probably regarded as the bearer of prosperity and increase. As such she resembles a fertility deity, hence her association with the bounty of the soil and the fruitfulness of women. Frequently she was an oracular goddess consulted in various ways regarding the future. Fortuna was worshiped extensively in Italy from the earliest times. At Praeneste her shrine was a well-known oracular seat, as was her shrine at Antium. Fortuna is often represented bearing a cornucopia as the giver of abundance and a rudder as controller of destinies, or standing

Fortuna holding a cornucopia and a rudder, classical sculpture; in Vatican City

Alinari—Art Resource

on a ball to indicate the uncertainty of fortune.

Fortunatus, Venantius, in full VENANTIUS HONORIUS CLEMENTIANUS FORTUNATUS (b. c. 540, Treviso, near Venice [Italy]—d. c. 600, Poitiers, Aquitaine [France]), poet and bishop of Poitiers, whose Latin poems and hymns combine echoes of classical Latin poets with a medieval tone, making him an important transitional figure between the ancient and medieval periods.

Probably in fulfillment of a vow to St. Martin of Tours, Fortunatus crossed the European continent, visiting Metz, Paris, and Tours and forming friendships with churchmen and officials. In 567 he reached Poitiers, where Rade-gunda, former queen consort of Chlotar I, had founded a monastery. Impressed by her holiness and that of Agnes, the abbess, he became a priest and subsequently bishop of Poitiers.

The extant works of Fortunatus are the *Vita S. Martini* ("Life of St. Martin"), written at the prompting of his friend Gregory of Tours; his prose biographies of saints (including the *Vita Rade-gundis*); and 11 books of poems (with an appendix of 34 poems). His early poems are courtly; they include addresses to bishops and officials, panegyrics, an epithalamium, epigrams, and occasional poems. While showing a pleasing facility, their dominant characteristic is a strongly rhetorical flavour. The influence of rhetoric persists in his religious poetry written at Poitiers (along with epigrams and epistles in his earlier vein), and it is especially effective in the poem celebrating the installation of Agnes as abbess. Of his six poems on the subject of the Cross, two are splendid hymns in which the religious note finds its noblest expression: these poems, the *Pange lingua* and the *Vexilla regis*, have been translated into English by John Mason Neale as "Sing My Tongue the Glorious Battle" and "The Royal Banners Forward Go."

Fortunatus is venerated as a saint in some Italian and French dioceses, where his feast day is celebrated on December 14.

Fortune, T. Thomas, in full TIMOTHY THOMAS FORTUNE (b. Oct. 3, 1856, Marianna, Fla., U.S.—d. June 2, 1928, Philadelphia, Pa.), the leading black American journalist of the late 19th century.

The son of slaves, Fortune attended a Freedmen's Bureau school for a time after the Civil War and eventually became a compositor for a black newspaper in Washington, D.C. Mov-

ing to New York City about 1880, he soon began a career in journalism as editor and publisher of a newspaper first called the *New York Globe* (1882–84), then the *New York Freeman* (1884–87), and finally the *New York Age*, editing the latter (with interruptions) from 1887 until he sold it in 1907. In his well-known editorials in the *Age*, Fortune defended the civil rights of both Northern and Southern blacks and spoke out against racial discrimination and segregation. He also wrote the book *Black and White* (1884), in which he condemned the exploitation of black labour by both agriculture and industry in the post-Reconstruction South.

Fortune was the chief founder in 1890 of the Afro-American League, which, though it collapsed in 1893, was an important forerunner of the National Association for the Advancement of Colored People. Though always a militant defender of black rights, Fortune had by 1900 allied himself with the more moderate Booker T. Washington, a move that would eventually compromise Fortune's reputation and lead to a decline in his influence. From 1923 until his death he edited the *Negro World*, the journalistic organ of the movement led by Marcus Garvey.

fortune-telling, the forecasting of future events or the delineation of character by methods not ordinarily considered to have a rational basis. Evidence indicates that forms of fortune-telling were practiced in ancient China, Egypt, Chaldea, and Babylonia as long ago as 4000 BC. Prophetic dreams and oracular utterances played an important part in ancient religion and medicine.

Predictive methods of fortune-telling include astrology (interpretation of the movements of heavenly bodies as influences on earthly events), numerology, and the utilization of objects such as playing cards, tea leaves, crystal balls, dice, fire, water, and scattered salt. Fortune-telling as a process of character analysis can take such forms as graphology (study of handwriting), physiognomy (study of facial characteristics), phrenology (study of contours on the skull), and palmistry (study of lines on the palm of the hand). See divination.

Fortune Theatre, Elizabethan public playhouse in northern London, built in 1600 by Philip Henslowe to compete with Cuthbert Burbage's newly constructed Globe Theatre. Named after the goddess of fortune, whose statue stood over the front doorway, the Fortune resembled the Globe except that it was square and its timbers remained unpainted.

Henslowe's contract for the Fortune Theatre, which provides a detailed description of its specifications, is a primary source of information about the features and construction of Elizabethan playhouses. Henslowe, a speculator who also built the Rose Theatre in 1587 and the Hope Theatre in 1614, employed Peter Street, the same contractor who had built the Globe. What is known about the features of the Globe, therefore, is largely derived from Henslowe's contract for the Fortune. From these documents, theatre historians have learned that the theatre had a circular, open yard, approximately 55 feet (17 m) in diameter, surrounded by three tiers of galleries. The rectangular stage, which was 43 feet wide by 27.5 feet deep (13 by 8.5 m), was covered by a roof. The contract also includes plans for the construction of gentlemen's rooms, twopenny rooms, and a tiring house, or dressing room. Henslowe paid £520 for the first Fortune Theatre and almost twice as much to have it rebuilt of brick after it burned down in 1621.

The Fortune opened in 1600 with a performance by the Admiral's Men, who continued to use it for many years. After the Puritans closed the public theatres in 1642, the Fortune

was used occasionally for clandestine performances. One year after Charles II's return to England in 1660, the Fortunes were torn down to accommodate the construction of 23 houses.

Fortuny, Mariano, in full MARIANO JOSÉ MARÍA BERNARDO FORTUNY Y MARSAL (b. June 11, 1838, Reus, Spain—d. Nov. 21, 1874, Rome, Italy), Spanish painter whose vigorous technique and anecdotal themes won him a considerable audience in the mid-19th century.

After four years at the Academy of Barcelona, Fortuny in 1858 won the Prix de Rome, which enabled him to complete his studies at Rome. In 1859 he was chosen by provincial authorities to go to Morocco to paint the scenes of the war between Spain and the emperor of Morocco. He soon returned to Spain but spent all of his remaining years in Rome, except for a year in Paris (1869–70). In Paris he entered into business relations with the noted art dealer Goupil; their association brought him large sums for his paintings and an international reputation.

Fortuny painted occasional large works, e.g., the huge "Battle of Tetuan," based on an incident in the Moroccan campaign and a fine example of pictorial reportage, charged with action and energy. More characteristic, however, are his small genre paintings filled with fine detail, works that attempted to recapture the grace and charm of an imaginary 18th-century scene.

Fortuny, Mariano, in full MARIANO FORTUNY Y DE MADRAZO (b. May 11, 1871, Granada, Spain—d. May 3, 1949, Venice, Italy), painter, inventor, photographer, and fashion designer best known for his dress and textile designs.

Fortuny was the son of a Spanish genre painter, Mariano Fortuny. His father died in 1874, and the boy was reared in Paris, where he studied painting with his uncle. In 1899 he moved with his mother to Venice, and he

Pleated silk Delphos dress with short tunic by Mariano Fortuny, 1912, photograph by Cecil Beaton for an exhibition at the Victoria and Albert Museum, London, 1971

Cecil Beaton photograph courtesy of Sotheby's London

spent the rest of his life there. While painting he also became interested in photography and theatre set design. Influenced by the Arts and Crafts Movement, he learned to control all aspects of his designs; for the theatre he created innovative lighting techniques, and he invented his own fabric dyes and fabrics, as well as machinery for printing cloth. He held more than 20 patents for his inventions.

About 1907 Fortuny's dress designs, many of them inspired by ancient Greek garments such as the tunic and the peplos, became extremely popular among the wealthy. The silk dresses that he designed were perhaps most remarkable for their subtle colouring and for the freedom of movement that they allowed. Some of these dresses were simple in execution, while others of similar design had hundreds of tiny pleats that ran from neck to foot. Fortuny drew inspiration for his many textile designs in cotton and velvet from a number of international sources; they are characterized by rich, sensuous colouring. Numerous examples of his work can be found in his former home—now the Fortuny Museum—in Venice.

Forty Martyrs of England and Wales, group of Roman Catholic martyrs executed by English authorities during the Reformation, most during the reign of Elizabeth I. An act of Parliament in 1571 made it high treason to question the queen's title as head of the Church of England—thus making the practice of Roman Catholicism an essentially treasonable act—and authorized the confiscation of the property of Roman Catholics, many of whom fled to the European continent. In the ensuing persecution, 183 English Catholics were put to death between 1577 and 1603; altogether, some 600 Catholics died in the persecutions of the 16th and 17th centuries. Some were executed for offenses as trivial as obtaining a papal license to marry. Forty of these victims were canonized by Pope Paul VI in 1970 as representatives of all the martyrs. Many were priests or members of religious orders, but 59—including seven of those canonized—were lay Catholics. Their designated feast day, October 25, commemorates the date of their canonization.

Forty-seven Rōnin (kabuki play): see Chūshingura.

forum, in Roman cities in antiquity, multipurpose, centrally located open area that was surrounded by public buildings and colonnades and that served as a public gathering place. It was an orderly spatial adaptation of the Greek agora, or marketplace, and acropolis.

In the laws of the Twelve Tables the word is used for the vestibule of a tomb; in a Roman camp the forum was an open place beside the praetorium, and the term was originally applied generally to the space in front of any public building or gateway.

In Rome itself the word forum denoted the flat and formerly marshy space between the Palatine and Capitoline hills (also called *forum Romanum*), which even during the regal period accommodated such public meetings as could not be held within the *area Capitolina*. In early times the *forum Romanum* was used for gladiatorial games, and over the colonnades were galleries for spectators; there were also shops of various kinds. Under the Roman Empire, when the forum became primarily a centre for religious and secular spectacles and ceremonies, it was the site of many of the city's most imposing temples and monuments. Among the structures surviving in whole or in part are the Temple of Castor and Pollux, the Temple of the Deified Caesar, the Mamertine Prison, the Curia (Senate house), the Temple of Saturn, the Temple of Vesta, the Temple of Romulus, the Arch of Titus, the Arch of Septimius Severus, and the Cloaca Maxima.

Trajan's Forum, Rome, designed by Apollodorus of Damascus, early 2nd century

Fototeca Unione, Rome

Also during the imperial period a considerable number of new forums, the *fora civilia* (judicial) and *venalia* (mercantile), came into existence. In addition to the *forum Romanum*, the forums of Caesar and Augustus belonged to the former class, the *forum boarium* (cattle), *holitorium* (vegetable), etc., to the latter.

The 1st-century-BC architect Vitruvius stated that the ideal forum should be large enough to accommodate a large crowd but not so large as to dwarf a small one. He proposed a 3:2 length-to-breadth ratio. It is to this proportion that Trajan's Forum in Rome was erected early in the 2nd century AD. Commissioned by the emperor Trajan and designed by Apollodorus of Damascus, it measures approximately 920 by 620 feet (about 280 by 190 m) and covers about 25 acres (10 ha). Persons entered through a triple gateway into a colonnaded open space lined with merchants' booths. The forum is flanked by two semicircular, colonnaded exedrae. Opposite the gateway is the Basilica Ulpia, beyond which is Trajan's Column, carved with relief sculpture depicting Trajan's victories. The aesthetic harmony of this space has influenced many subsequent town planners.

The forum was generally paved, and, although on festal occasions chariots were driven through, it was not a thoroughfare and was enclosed by gates at the entrances, of which traces have been found at Pompeii.

Foscari, Francesco (b. c. 1373—d. Oct. 31/Nov. 1, 1457, Venice [Italy]), doge of Venice who led the city in a long and ruinous series of wars against Milan. His life story is the subject of the tragedy *The Two Foscari* by Lord Byron and of an opera by Giuseppe Verdi.

Foscari, portrait panel by Bastiani Lassaro, c. 1460; in the Musei Civici, Venice

By courtesy of the Musei Civici, Venice

Belonging to a prominent Venetian family, Foscari headed the Council of Forty (1401) and the Council of Ten (1405–13), Venice's ruling bodies, during the city's wars for territorial expansion. Soon after his election as doge in 1423, he made an alliance with Florence and began a war against the duke of Milan, Filippo Maria Visconti. The Venetians won Brescia in 1426, and a peace was reached in 1427. War resumed in 1431, and the subsequent Peace of Ferrara (1433) failed to settle the balance of power. A war with Bologna ended in a treaty in 1441 that increased Venetian territory, to which Ravenna was added shortly thereafter.

In 1443 he resumed the war with Milan. Even after Filippo Maria died, Foscari pursued the war. The greater part of northern Italy was ravaged, and no member of its complex system of alliances emerged as a clear victor. Finally, in 1454 the Peace of Lodi ended the hostilities, and the Italian League, including Venice, Florence, and Milan, was formed.

In the meantime, Constantinople had fallen to the Turks (1453). His attention on his Italian wars, Foscari had failed to prevent losses of Venice's eastern territory to the Turks.

After such blows to Venice's trade with the Orient, Foscari's enemies sought to depose him. They accused him, probably unjustly, of the murder of the Venetian admiral Piero Loredan. This accusation, together with the banishment of his son for suspected treason, forced Foscari's resignation on the formal demand of the Council of Ten (Oct. 23, 1457). Eight days later he was dead.

Foscolo, Ugo, original name NICCOLÒ FOSCOLO (b. Feb. 6 [Jan. 26, Greek calendar], 1778, Zákynthos, Greece—d. Sept. 10, 1827, Turnham Green, near London), poet and

Foscolo, detail of an oil painting by François-Xavier Fabre, 1818; in the Gallery of Modern Art, Florence

Alinan—Art Resource

novelist whose works articulate the feelings of many Italians during the turbulent epoch of the French Revolution, the Napoleonic Wars, and the restoration of Austrian rule; they rank among the masterpieces of Italian literature.

Foscolo, born of a Greek mother and a Venetian father, was educated at Spalato (now Split, Croatia) and Padua, in Italy, and moved with his family to Venice in about 1793. There he moved in literary circles. In 1797 the performance of his tragedy *Tieste* ("Thyestes") made him famous.

Foscolo's early enthusiasm for Napoleon, proclaimed in his ode *A Bonaparte liberatore* (1797; "To Bonaparte the Liberator"), quickly turned to disillusionment when Napoleon ceded Venetia to Austria in the Treaty of Campo Formio (1797). Foscolo's very popular novel *Ultime lettere di Jacopo Ortis* (1802; *The Last Letters of Jacopo Ortis*, 1970) contains a bitter denunciation of that transaction and shows the author's disgust with Italy's social and political situation. Some critics consider this story the first modern Italian novel.

When the Austrians and Russians invaded Italy in 1799, Foscolo, with other Italian patriots, joined the French side. Made a captain

in the Italian division of the French army after the defense of Genoa in 1800, he had commissions in Milan, Bologna, and Florence, where he found time to involve himself in many love affairs.

Finally Foscolo was sent to serve in France (1804–06). During that period he translated some classical works and Laurence Sterne's *Sentimental Journey* into Italian and wrote odes and sonnets.

In 1807 Foscolo returned to Milan and established his literary reputation with "Dei sepolcri" (Eng. trans., "Of the Sepulchres," c. 1820), a patriotic poem in blank verse, written as a protest against Napoleon's decree forbidding tomb inscriptions. In 1808 the poem won for its author the chair of Italian rhetoric at the University of Padua. When the chair was abolished by Napoleon the next year, Foscolo moved on to Milan. The satirical references to Napoleon in his tragedy *Aiace* (first performed 1811; "Ajax") again brought suspicion on him; in 1812 he moved to Florence, where he wrote another tragedy, *Ricciarda*, and most of his highly acclaimed unfinished poem, *Gräzie* (published in fragments 1803 and 1818, in full 1822; "The Graces"). In 1813 Foscolo returned to Milan.

Napoleon fell the following year, the Austrians returned to Italy, and Foscolo, refusing to take the oath of allegiance, fled first to Switzerland and then in 1816 to England. Popular for a time in English society because he was an Italian patriot, Foscolo supported himself by teaching and writing commentaries on Dante, Boccaccio, and Petrarch for *The Edinburgh Review* and *The Quarterly Review*. He died in poverty. In 1871, with great national ceremony, his remains were moved from England and interred in Sta. Croce church, Florence.

Fosdick, Harry Emerson (b. May 24, 1878, Buffalo—d. Oct. 5, 1969, Bronxville, N.Y., U.S.), liberal Protestant minister, teacher, and author, who was pastor of the interdenominational Riverside Church in New York City (1926–46), preacher on the National Vespers nationwide radio program (1926–46), and a central figure in the Protestant liberal–fundamentalist controversies during the 1920s. Fosdick was an early practitioner of pastoral counselling and of the church's cooperation with psychiatry.

Ordained a Baptist minister in 1903, he was a minister at Montclair, N.J. (1904–15), and taught at Union Theological Seminary (1908–46). In 1919 he became associate pastor at the First Presbyterian Church, New York City. Crowds filled the church to hear his sermons, but conservative Protestants denounced him as a "modernist." His sermon "Shall the Fundamentalists Win?" (preached on May 21, 1922) caused an uproar and led to his resignation in 1925. Called to the Park Avenue Baptist Church within a few months, he requested construction of a larger, interdenominational church near Columbia University. Riverside Church was built with the aid of John D. Rockefeller, Jr., a trustee.

Fosdick was a prolific author of sermons, articles, and books. These include *The Manhood of the Master* (1913), *The Secret of Victorious Living* (1934), *On Being a Real Person* (1943), *A Faith for Tough Times* (1952), and *The Living of These Days, an Autobiography* (1956).

Foss, Lukas, original name LUKAS FUCHS (b. Aug. 15, 1922, Berlin), German-born U.S. composer, pianist, and conductor, widely recognized for his experiments with improvisation and aleatoric (chance) music.

He studied in Berlin and Paris and, after moving to the United States in 1937, with the composers Randall Thompson and Paul Hindemith and the conductors Serge Koussevitzky and Fritz Reiner. Foss published his first work at age 15, and in 1945 he became the youngest composer to win a Guggenheim

Fellowship. In 1957, while professor of composition and orchestra director at the University of California at Los Angeles, he founded the Improvisation Chamber Ensemble, the ve-

Foss, 1969

hicle of many of his experiments in aleatoric and stochastic (mathematical probability) music. From 1963 to 1970 he was conductor of the Buffalo Philharmonic Orchestra.

He founded (1963) and became director of the Center for Creative and Performing Arts at the State University of New York at Buffalo, and he was named music director and conductor of the Brooklyn Philharmonia (later Brooklyn Philharmonic) in 1971. He was appointed music director and Conductor of the Milwaukee Symphony Orchestra in 1981.

Foss's early works are Neoclassical—tonal and well-organized in harmony and counterpoint. Among these works are symphonic music (*Ode*; first performed, 1945), ballet (*Gift of the Magi*; 1945), concerti (*Second Piano Concerto*; 1951, rev. 1953; Music Critics' Award, 1954), opera (*Griffelkin*; commissioned by and first performed on NBC-TV, 1955), cantatas, and chamber music. His later chamber pieces (*Echoi*, 1963; *Elytres*, 1964) are avant-garde in their treatment of the ordering of musical events by means of chance operations and in the variety of controls over musical form—controls determined to a large extent by the performers during the actual performance. Later works include *Divertissement* for string quartet (1972), *Cave of the Winds* for wind quintet (1972), the orchestral work *Folk-song* (1975), and *American Cantata* (1977) for tenor, soprano, two speakers, chorus, and orchestra.

fossa, also spelled FOUSSA (*Cryptoprocta ferox*), largest carnivore native to Madagascar, a catlike forest dweller of the civet family, Viverridae. The fossa grows to a length of about 1.5 metres (5 feet), including a tail about 66 centimetres (26 inches) long, and has short legs and sharp, retractile claws. The fur is close, dense, and grayish to reddish brown. Generally most active at night, the fossa is both terrestrial and arboreal. It usually hunts alone and commonly feeds on birds and lemurs but also preys on livestock. Many legends centre on the fossa; some, such as reports of its savagery, are probably much exaggerated.

Because of certain structural features, the fossa was formerly classified in the cat family (Felidae). Its common name sometimes leads to its confusion with the Malagasy civet, or fanaloka, *Fossa fossa*.

Fossano, town, Cuneo province, Piemonte (Piedmont) region, northern Italy, northeast of Cuneo (city). Fossano is the site of a 14th-century four-sided castle, which belonged to the princes of Acaia; its hospital and the Trinity Church were designed by Francesco Gallo in the 18th century. The town has mineral baths and is an agricultural and cattle-breeding

centre. Local industries include textiles, metallurgy, and chemicals. Pop. (1989 est.) mun., 23,104.

Fosse, Bob, byname of ROBERT LOUIS FOSSE (b. June 23, 1927, Chicago, Ill., U.S.—d. Sept. 23, 1987, Washington, D.C.), American theatre and motion-picture choreographer and director of musical plays.

The son of a vaudevillian, Fosse attended dance schools as a child and began dancing professionally at the age of 13. A chorus dancer in national tours and Broadway musicals between 1947 and 1953, he signed a contract with Metro-Goldwyn-Mayer in the latter year and danced and sang in three film musicals, including *Kiss Me Kate*. He returned the next year to Broadway, where he won his first Tony award for choreographing *The Pajama Game* (1954), becoming noted then and later for his clever, angular groupings of dancers and fresh, stylistically exaggerated staging. He then arranged the dances for several Broadway shows, winning Tony awards for *Damn Yankees* (1955), *Redhead* (1959), *Little Me* (1963), *Sweet Charity* (1966), *Pippin* (1972), and *Dancin'* (1978).

Fosse choreographed and directed the successful motion-picture musicals *Cabaret* (1972) and *All That Jazz* (1979). He also directed the nonmusical films *Lenny* (1974), based on the life of comedian Lenny Bruce, and *Star 80* (1983).

Fosse, Charles de La (French painter): see La Fosse, Charles de.

Fosse Way, major Roman road that traversed Britain from southwest to northeast. It ran from the mouth of the River Axe in Devon by Axminster and Ilchester (Lindinae) to Bath (Aqua Sulis) and Cirencester, thence straight for 60 miles (100 km) to High Cross (Venonae), where it intersected Watling Street, and on to Leicester (Ratae). After crossing the River Trent near Newark, it reached Ermine Street south of Lincoln (Lindum). It was probably laid as a military road along the temporary frontier reached in the Roman conquest before AD 47.

Fossey, Dian (b. Jan. 16, 1932, San Francisco, Calif., U.S.—d. Dec. 26, 1985, Rwanda), American zoologist who became the world's leading authority on the mountain gorilla.

Fossey trained to become an occupational therapist at San Jose State College and graduated in 1954. She worked in that field for several years at a children's hospital in Louisville, Ky. In 1963 she took a trip to eastern Africa, where she met the anthropologist Louis Leakey and had her first glimpse of mountain gorillas. She returned to the United States after her trip, but in 1966 Leakey persuaded her to return to Africa to study the mountain gorilla in its natural habitat on a long-term basis. To this end, she established the Karisoke Research Centre in 1967 and began a hermitlike existence in Rwanda's Virunga Mountains, which was one of the last bastions of the endangered mountain gorilla. Through patient effort, Fossey was able to observe the animals and accustom them to her presence, and the data that she gathered greatly enlarged contemporary knowledge of the gorilla's habits, communication, and social structure. Fossey recounted her observations in magazine articles and her book *Gorillas in the Mist* (1983). She obtained a Ph.D. degree in zoology from the University of Cambridge in 1974 and went on to teach at Cornell University, N.Y., while remaining involved with the Karisoke Research Centre. Fossey took increasingly drastic measures to protect the Virunga gorillas from both poachers and the neighbouring African farmers, and in 1985 she was murdered at her campsite.

fossil, remnant, impression, or trace of an animal or plant of a past geologic age that has been preserved in the Earth's crust. The complex of data recorded in fossils worldwide, known as the fossil record, is the primary source of information about the history of life on Earth.

Only a small fraction of ancient organisms are preserved as fossils, and usually only organisms that have a solid and resistant skeleton are readily preserved. Most major groups of invertebrate animals have a calcareous skeleton or shell (e.g., corals, mollusks, brachiopods, bryozoans). Other forms have shells of calcium phosphate (which also occurs in the bones of vertebrates), or silicon dioxide. A shell or bone that is buried quickly after deposition may retain these organic tissues, though they become petrified (converted to a stony substance) over time. Unaltered hard parts, such as the shells of clams or brachiopods, are relatively common in sedimentary rocks, some of great age.

The hard parts of organisms that become buried in sediment may be subject to a variety of other changes during their conversion to solid rock, however. Solutions may fill the interstices, or pores, of the shell or bone with calcium carbonate or other mineral salts and thus fossilize the remains, in a process known as permineralization. In other cases there may be a total replacement of the original skeletal material by other mineral matter, a process known as mineralization, or replacement. In still other cases, circulating acid solutions may dissolve the original shell but leave a cavity corresponding to it, and circulating calcareous or siliceous solutions may then deposit a new matrix in the cavity, thus creating a new impression of the original shell.

By contrast, the soft parts of animals or plants are very rarely preserved. The embedding of insects in amber and the preservation of the carcasses of Pleistocene-era mammoths in ice are rare but striking examples of the fossil preservation of soft tissues. Traces of organisms may also occur as tracks or trails or even borings.

The great majority of fossils are preserved in a water environment because land remains are more easily destroyed. Anaerobic conditions at the bottom of the seas or other bodies of water are especially favourable for preserving fine details, since no bottom faunas, except for anaerobic bacteria, are present to destroy the remains. In general, for an organism to be preserved two conditions must be met: rapid burial to retard decomposition and to prevent the ravaging of scavengers; and possession of hard parts capable of being fossilized.

Mesodon, macropterus, 13 × 16½ cm; in the Eichstätt Museum, West Germany
Lilly Stunzi, Zurich, New York

In some places, such as the Grand Canyon in northern Arizona, one can observe a great thickness of nearly horizontal strata representing the deposition of sediment on the seafloor over many hundreds of millions of years. It is often apparent that each layer in such a sequence contains fossils that are distinct from those of the layers that are above and below it. In such sequences of layers in different

geographic locations, the same, or similar, fossil floras or faunas occur in the identical order. By comparing overlapping sequences, it is possible to build up a continuous record of faunas and floras that have progressively more in common with present-day life forms as the top of the sequence is approached.

The study of the fossil record has provided important information for at least four different purposes. The progressive changes observed within an animal group are used to describe the evolution of that group. Fossils also provide the geologist a quick and easy way of assigning a relative age to the strata in which they occur. The precision with which this may be done in any particular case depends on the nature and abundance of the fauna: some fossil groups were deposited during much longer time intervals than others. Fossils used to identify geologic relationships are known as index fossils.

Fossil organisms may provide information about the climate and environment of the site where they were deposited and preserved (e.g., certain species of coral require warm, shallow water, or certain forms of deciduous angiosperms can only grow in colder climatic conditions).

Finally, fossils are useful in the exploration for minerals and mineral fuels. For example, they serve to indicate the stratigraphic position of coal seams. In recent years, geologists have been able to study the subsurface stratigraphy of oil and natural gas deposits by analyzing microfossils obtained from core samples of deep borings.

fossil fuel, any of a class of materials of biological origin occurring within the Earth's crust that can be used as a source of energy.

A brief treatment of fossil fuels follows. For full treatment of their formations, properties, and distribution, see MACROPAEDIA: Fuels, Fossil. For information on their recovery and processing, see Industries, Extraction and Processing.

Fossil fuels include coal, natural gas, petroleum, shale oil, and bitumen. They all contain carbon and were formed as a result of geologic processes from the remains of organic matter produced by photosynthesis hundreds of millions of years ago.

All fossil fuels can be burned with air or with oxygen derived from the air to provide heat. This heat may be employed directly, as in the case of a home furnace, or utilized to produce steam with which to drive a turbogenerator so that it can supply electricity. In still other cases, as, for example, gas turbines used in jet aircraft, the heat yielded by burning a fossil fuel can serve to increase both the pressure and the temperature of the combustion products to furnish motive power.

Since the late 18th century, fossil fuels have been consumed at an ever-increasing rate. Today, they supply nearly 90 percent of all the energy consumed by the industrially developed nations of the world. New deposits continue to be discovered, but the reserves of these principal fossil fuels remaining in the Earth are limited. The amounts that can be recovered economically are difficult to estimate and are in large part contingent on their assumed rate of consumption and future value, as well as on technological developments. For example, a coal bed must be no less than 60 cm (24 inches) thick and be buried no more than about 2,000 m (6,560 feet) to be mined economically with available equipment and techniques. Advances in technology, however, may make it possible to mine thinner beds at greater depths at reasonable cost, thereby increasing the amount of recoverable coal. Estimating remaining oil resources is equally difficult. However, as recoverable deposits of conventional (light-to-medium) oil become depleted, it is expected that heavy oil and syn-crudes from tar sands and oil shales will be

exploited as sources of liquid petroleum on a wide scale.

Fostat, al- (Egypt): see Fustât, al-

Foster, Abigail Kelley, née KELLEY, by-name ABBY (b. Jan. 15, 1810, Pelham, Mass., U.S.—d. Jan. 14, 1887, Worcester, Mass.), American feminist, abolitionist, and lecturer. Her public addresses gained her nationwide fame and notoriety in an era when the presentation of political speeches by women to "mixed" audiences (of men and women) was the subject of controversy.

Foster, John W(atson) (b. March 2, 1836, Pike county, Ind., U.S.—d. Nov. 15, 1917, Washington, D.C.), diplomat and U.S. secretary of state (1892–93) who negotiated an ill-fated treaty for the annexation of Hawaii.

After service in the Union Army during the Civil War, Foster, a lawyer and newspaper editor in Evansville, Ind., was active in state Republican affairs. He served as minister to Mexico (1873–80), minister to Russia (1880–81), and minister to Spain (1883–85).

Appointed secretary of state by President Benjamin Harrison in 1892, Foster tacitly encouraged American interests in Hawaii in their revolt against Queen Liliuokalani and negotiated a treaty (1893) for the annexation of Hawaii (which, at the urging of his successor, Secretary of State Walter Quinton Gresham, was withdrawn from Senate consideration by the newly installed administration of President Grover Cleveland). Foster resigned in early 1893 in order to represent the United States in the Bering Sea controversy before an arbitration tribunal at Paris.

Foster, Sir Michael (b. March 8, 1836, Huntingdon, Huntingdonshire, Eng.—d. Jan. 28, 1907, London), English physiologist and educator who introduced modern methods of teaching biology and physiology that emphasized laboratory training.

Sir Michael Foster, detail of an oil painting by J. Collier, 1907; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

Foster earned a medical degree from University College, London, in 1859 and was a protégé of the biologist T.H. Huxley. Foster became an instructor at University College in 1867 and went on to become a teacher (1870–83) and then the first professor of physiology (1883–1903) at the University of Cambridge. He greatly enlarged and modernized the teaching of biology at Cambridge, and under his leadership that school became a world centre for research into physiology. Indeed, many of the most eminent British biologists of the early 20th century were originally students of his. His own research, though overshadowed by his teaching activities, centred on determining whether the heartbeat depends solely on nerve discharges or whether the heart muscles have a capacity for rhythmic contraction independent of nervous influence.

Foster, Stephen (Collins) (b. July 4, 1826, Lawrenceville [now part of Pittsburgh], Pa., U.S.—d. Jan. 13, 1864, New York, N.Y.), American composer whose popular minstrel songs and sentimental ballads achieved for him an honoured place in the music of the United States.

Stephen Foster, 1859
By courtesy of the Foster Hall Collection, University of Pittsburgh

Foster grew up on the urban edge of the Western frontier. Although formally untutored in music, he had a natural musical bent and began to write songs as a young boy. He absorbed musical influences from the popular, sentimental songs sung by his sisters; from black church meetings he attended with the family's servant Olivia Pise; from popular minstrel show songs; and from songs sung by black labourers at the Pittsburgh warehouse where he worked for a time.

In 1842 he published his song "Open Thy Lattice, Love." In 1846 he went to Cincinnati as a bookkeeper, returning to Pittsburgh in 1850 to marry Jane McDowell, a physician's daughter. In 1848 he sold his song "Oh, Susanna" for \$100; together with his "Old Uncle Ned" it brought the publisher about \$10,000. In 1849 he entered into a contract with Firth, Pond & Co., the New York publishers to whom he had previously given the rights for "Nelly Was a Lady." He was commissioned to write songs for Edwin P. Christy's minstrel show. The most famous, "Old Folks at Home" (1851), also called "Swanee River," appeared originally under Christy's name; Foster's name appeared on the song after 1879. In 1852 he made his only visit to the South.

Although he stated that his ambition was to become "the best Ethiopian [*i.e.*, Negro minstrel] song writer," he vacillated between composing minstrel songs (for which he is largely remembered) and songs in the sentimental "respectable" style then popular. He was never a sharp entrepreneur for his talents, and in 1857, in financial difficulties, he sold all rights to his future songs to his publishers for about \$1,900. The profits from his songs went largely to performers and publishers.

In 1860, already struggling with sinking morale and alcoholism, he moved to New York City. His songs after that date are largely sentimental songs such as "Poor Drooping Maiden." His wife left him in 1861, except for a brief reconciliation in 1862. He spent the rest of his life in debt.

He left about 200 songs, for most of which he wrote the words as well as the music. They include "Camptown Races," "Nelly Bly," "My Old Kentucky Home," "Massa's in de Cold, Cold Ground," "Old Dog Tray," "Old Black Joe," "Jeanie with the Light Brown Hair," and "Beautiful Dreamer."

Foster, William Z(ebulon) (b. Feb. 25, 1881, Taunton, Mass., U.S.—d. Sept. 1, 1961, Moscow, Russian S.F.S.R.), American labour agitator and leader in the Communist Party of the United States of America from the 1920s

to 1957. He ran for the U.S. presidency in 1924, 1928, and 1932.

Fothergill, John (b. March 8, 1712, Wensleydale, Yorkshire, Eng.—d. Dec. 26, 1780, London), physician who was the first to record coronary arteriosclerosis (hardening of the walls of the arteries supplying blood to the heart muscle) in association with a case of angina pectoris. A friend of Benjamin Franklin, he collaborated with him on a plan for British reconciliation with the American colonies (1774).

Fothergilla, genus for about five species of deciduous shrubs of the witch hazel family (Hamamelidaceae) native to the southeastern United States and sometimes planted as ornamentals for their spring flowering and their fall colour. Their flowers lack petals but produce conspicuous white to yellow puffs of stamens (pollen-producing structures) in spring. The foliage is coarse in texture. All the species are also called witch alder, but especially *F. gardenii*, up to 1 m (3 feet) tall. The leaves of fothergillas turn brilliant shades of orange to crimson in autumn.

Fotoform, group of photographers in Germany after World War II. Headed by Otto Steinert (b. 1915), a physician who abandoned medicine for photography, the group explored the photographic techniques developed at the Bauhaus, the most advanced school of design in Germany between World Wars I and II. The first Fotoform exhibits in Milan and Cologne (both 1950) emphasized abstract form derived from patterns found in nature and from darkroom manipulation of the image. Photographs stressing abstract form had been unknown in Germany since the Nazis closed the Bauhaus in 1933, and the Fotoform exhibition was a sensation.

"Interchangeable Forms," negative montage by Otto Steinert, 1955

Steinert, however, felt that the format of the Fotoform shows had been too limited. At the group's remaining three exhibitions, which he titled "Subjektive Fotografie," he accepted any photograph, from the nonobjective photograph to literal reportage, that was aesthetically satisfying and bore the imprint of profound individual creativity. Nevertheless, most contributors continued to submit nonobjective photographs. Feeling that the once revolutionary style of Fotoform had become a rigid formula, Steinert abandoned Fotoform after the 1958 exhibition. The Fotoform style, however, continued to influence photographers and designers worldwide.

Fou-liang (China): see Ching-te-chen.

Foucault, Jean-Bernard-Léon (b. Sept. 18, 1819, Paris, Fr.—d. Feb. 11, 1868, Paris), French physicist who introduced and helped develop a technique of measuring the absolute velocity of light with extreme accuracy. He provided experimental proof that the Earth rotates on its axis.

Foucault was educated for the medical profession, but his interests turned to experimental physics. With Armand Fizeau, he began a series of investigations of light and heat. By 1850 he established that light travels slower in water than in air. In the same year he measured the velocity of light, finding a value that is within 1 percent of the true figure.

Foucault, engraving
Giraudon—Art Resource/EB Inc

In 1851, by interpreting the motion of a heavy iron ball swinging from a wire 67 m (220 feet) long, he proved that the Earth rotates about its axis. Such a "Foucault pendulum" always swings in the same vertical plane, but on a rotating Earth, this vertical plane slowly changes, at a rate and direction dependent on the geographic latitude of the pendulum. For this demonstration and a similar one utilizing a gyroscope, Foucault received in 1855 the Copley Medal of the Royal Society of London and was made physical assistant at the Imperial Observatory, Paris. He discovered the existence of eddy currents, or "Foucault currents," in a copper disk moving in a strong magnetic field, constructed an improved mirror for the reflecting telescope, and in 1859 invented a simple but extremely accurate method of testing telescope mirrors for surface defects.

Foucault, Michel, in full PAUL-MICHEL FOUCAULT (b. Oct. 15, 1926, Poitiers, Fr.—d. June 25, 1984, Paris), French philosopher and historian, one of the most influential and controversial scholars of the post-World War II period.

Education and career. The son and grandson of physicians, Michel Foucault was born to a solidly bourgeois family. A distinguished but sometimes erratic student, Foucault gained entry at the age of 20 to the *École Normale Supérieure* (ENS) in Paris in 1946. Once there, he studied psychology and philosophy, embraced and then abandoned communism, and established a reputation as a sedulous, brilliant, and eccentric student.

After graduating in 1952, Foucault taught at the University of Lille, then spent five years (1955–60) as a cultural attaché in Uppsala, Sweden; Warsaw, Poland; and Hamburg, West Germany (now Germany). His doctoral dissertation, *Folie et déraison: histoire de la folie à l'âge classique*, which he defended at the ENS in 1961, was published in an abridged version in English in 1965 as *Madness and Civilization: A History of Insanity in the Age of Reason*. With the appearance of *Les Mots et les choses* (*The Order of Things*) in 1966, Foucault began to attract wide notice. From 1966 to 1968 he taught at the University of Tunis, and in 1970 he was awarded a chair in the history of systems of thought at the Collège de France, the country's most prestigious postsecondary institution.

Between 1969 and 1984 Foucault wrote several works, including *L'Archéologie du savoir* (1969; *The Archeology of Knowledge*), *Surveiller et punir: naissance de la prison* (1975;

Discipline and Punish: The Birth of the Prison), three volumes of a history of Western sexuality, and numerous essays. He died of a septicemia typical of acquired immunodeficiency syndrome (AIDS) in 1984, the fourth volume of his history of sexuality still incomplete.

Foucault's ideas. What are human beings? What is their essence? What types of human beings have there been? What is the essence of human history? Of humankind? Contrary to so many of his intellectual predecessors, Foucault sought not to answer these traditional questions but to examine them, and the responses they had inspired, critically. He directed his most sustained skepticism toward those responses—among them, race, the unity of reason or the psyche, progress, and liberation—that had become commonplaces in Europe and the United States in the 19th century. He argued that such commonplaces informed both Hegelian phenomenology and Marxist materialism, as well as the evolutionary biology, physical anthropology, clinical medicine, psychology, sociology, and criminology of the same period. The latter three disciplines, along with history linguistics, politics, and law, constitute what came to be called in French *les sciences humaines*, or "the human sciences."

Several Anglo-American positivist philosophers, among them Carl Hempel (*q.v.*), had faulted the human sciences for failing to achieve the conceptual and methodological rigour of mathematics or physics. Foucault found fault with them as well, but he decisively rejected the positivist tenet that the methods of the pure or natural sciences provided an exclusive standard for arriving at genuine or legitimate knowledge. His critique concentrated instead upon the fundamental point of reference that had grounded and guided inquiry in the human sciences: the concept of "man." The man of this inquiry was a creature purported, like many preceding conceptions, to have a constant essence—indeed, a double essence. On one hand, man was an object, like any other object in the natural world, subject to the indiscriminate dictates of physical laws. On the other hand, man was a subject, an agent uniquely capable of comprehending and altering his worldly condition in order to become more fully, more essentially, himself. Foucault reviewed the historical record for evidence that such a creature had ever existed, but to no avail. Looking for objects, he found only a plurality of subjects whose features varied dramatically with shifts of place and time. The historical record aside, would the dual "man" of the human sciences perhaps make his appearance at some point in the future? In *The Order of Things* and elsewhere, Foucault suggested that, to the contrary, a creature somehow fully determined and fully free was little short of a paradox, a contradiction in terms. Not merely had it never existed in fact, it could not exist, even in principle.

Yet a further puzzle remained: How could such an erroneous, such an impossible, figure have been so completely taken for granted for so long? Foucault argued that in the emerging nation-states of 17th- and 18th-century Europe, "man" was a conceptual prerequisite of social institutions and practices that were then necessary to maintain an optimally productive citizenry. With the advent of "man," the notion gradually emerged that human character and experience were not immutable, that both body and soul could be manipulated and reformed. The idea of reform provided the technologies and institutions of modern policing their enduring rationale. For Foucault these institutions were epitomized in a model prison known as the "Panopticon." Conceived by the 18th-century philosopher and social reformer Jeremy Bentham (*q.v.*), the prison's circular design laid each inmate open to the scrutiny of the dark eye of a central watchtower. It was an

institution of "discipline," a mode of domination that sought to render each instance of "deviance" utterly visible, whether in the name of prevention or rehabilitation.

Although discipline operated on individuals, it was paired with a current of reformism that was aimed at entire human populations. The prevailing sensibility of its greatest champions was markedly medical. They scrutinized everything from sexual behaviour to social organization for relative pathology or health. They also sought out the "deviant," but less in order to eradicate it than to keep it in acceptable check. This "biopolitics" of the reformers, according to Foucault, contained the basic principles of the modern welfare state. A thinker more inclined to strict materialism might have added that in both discipline and biopolitics the human sciences served an ideological function, cloaking the apparatuses of arbitrary domination with the sober aura of objectivity. Foucault, however, opposed the tendency to construe science as the simple handmaiden of power, and he opposed any identification of power with knowledge. Rather, he called for an appreciation of the ways in which knowledge and power are always entangled with each other in historically specific circumstances, forming complex dynamics of what he termed *puissance-savoir*, or "power-knowledge."

For Foucault, domination was not the only outcome of these dynamics. Another was "subjectivation," the historically specific classification and shaping of individual human beings into "subjects" of various kinds, including heroic and ordinary, "normal" and "deviant." The distinction between the two came somewhat late to Foucault, but once he made and refined it he was able to clarify the status of some of his earliest observations and to identify a theme that had been present in all his writings. His understanding of subjectivation, however, changed significantly over the course of two decades, as did the methods he applied to its analysis. Intent on devising a properly specific history of subjects, he initially pressed the analogy between the corpus of statements about subjects produced and presumed true at any given historical moment and the artifacts of some archaeological site or complex. He was thus able to flesh out the sense of his frequent allusions to "discourses" and to those loose agglomerations of discourses that he called, borrowing the ancient Greek term for science or systematic understanding, *épistémès*. He was able to reveal the inherently local qualities of past conceptions of being human, as well as the frequent abruptness of their coming into being and passing away. This "archaeology of knowledge" nevertheless had its shortcomings. Among other things, its consideration of both power and power-knowledge was at best partial, if not oblique.

By 1971 Foucault already had demoted archaeology in favour of "genealogy," a method that traced the ensemble of historical contingencies, accidents, and illicit relations that make up the ancestry of one or another currently accepted theory or concept in the human sciences. With genealogy, Foucault set out to unearth the artificiality of the dividing line between the putatively illegitimate and its putatively normal and natural opposite. *Discipline and Punish* was his genealogical exposé of the artifices of power-knowledge that had naturalized the "criminal character," and the first volume of *Histoire de la sexualité* (1976; *The History of Sexuality*) was his exposé of the Frankensteinian machinations that had naturalized the distinction between "homosexual" and "heterosexual." Yet, even in these luminous "histories of the present" something still remained out of view: human freedom. In order to bring it into focus, Foucault turned his attention to "governmentality," the "artful management" of relations of power in those arenas in which individuals, despite being

dominated, have been able in some measure to govern, to be, and to create themselves. He expanded the scope (and lessened the bite) of genealogy. No longer focused exclusively on the dynamics of power-knowledge, it came to encompass the broader dynamics of human reflection, of the process of posing questions and seeking answers, of "problematization." It could thus chart the possibilities, past and present, of ethics—the "reflective practice of freedom"—a domain in which human beings could exercise their power to conceive and test the modes of domination and subjectivation under which they lived.

Foucault's increasing concern with ethics led him to a far-reaching revision of the design of the subsequent volumes of *The History of Sexuality*, all of which were to have addressed subjectivation primarily in the 19th century. Seeking greater genealogical depth, Foucault turned to the classics and, after a long delay, published a study of the ethical questioning of carnal pleasure in ancient Greece. The next volume dealt with the "care of the self" in later antiquity. His concern with ethics led him in later work to study how people care for one another in social relations such as friendship, and it led him finally to an elegant meditation, unpublished at his death, on the conduct of modern philosophy, the title of which is that decidedly open-ended question to which Immanuel Kant and Moses Mendelssohn had been asked to respond some 200 years before: "What is Enlightenment?"

Foucault appropriately placed himself in the critical tradition of philosophical inquiry stemming from Kant, but his thought matured through the variety of its engagements. He rejected both Hegelianism and Marxism but took both quite seriously. The work of the French modernist writers Raymond Roussel, Georges Bataille, and Maurice Blanchot galvanized his conviction that neither a proper epistemology nor a proper metaphysics could be founded on a general and ahistorical conception of the "subject." The writings of Friedrich Nietzsche directed him to the history of the body and of the collusion between power and knowledge. It also offered him prototypes for both archaeology and genealogy. In the work of the French philosopher Gilles Deleuze, Foucault discerned elements of a general logic of problematization. His conversations with philosopher Hubert Dreyfus and anthropologist Paul Rabinow stimulated his turn toward ethics and the genealogy of problematization. Owing mainly to his mentor, the historian of science Georges Canguilhem, Foucault came to regard human life as a discontinuous, disruptive, clumsy, and sometimes despotic quest to come to terms with an ever-recalcitrant environment. A history of systems of human thought would thus have to be a persistently local history. It would have to recognize that all ideas are normative, no matter what their content. It could be a history of truth, but it also would have to be a long—and in its own way tragic—history of error.

Foucault's influence. Foucault has been widely read and discussed in his own right. He has galvanized an army of detractors, the less attentive of whom have misread his critique of "man" as radically antihumanist, his critique of power-knowledge as radically relativist, and his ethics as radically aestheticist. Still, Foucault continues to inspire increasingly important alternatives to established practices of cultural and intellectual history. In France and the Americas, Foucault's unraveling of Marxist universalism has continued both to vex and to inspire activists of the left. The antipsychiatry movement of the 1970s and '80s owed much to Foucault, though he did not consider himself one of its members. His critique of the human sciences provoked much soul-searching within anthropology and its allied fields, even as it helped a new generation of scholars to embark upon a cross-cultural dialogue on

domination and subjectivation. Foucault's elucidation of discipline and biopolitics likewise has had a noticeable impact on recent studies of colonialism, law, technology, gender, and race. The first volume of *The History of Sexuality* has become canonical for both gay and lesbian studies and "queer" theory, a multidisciplinary study aimed at critical examinations of traditional conceptions of sexual and gender identity. The terms *discourse*, *genealogy*, and *power-knowledge* have become deeply entrenched in the lexicon of virtually all contemporary social and cultural research.

Foucault has attracted several biographers, some of whom have been happy to flout his opposition to seeking the key to an oeuvre in the psychology or personality of its author. Yet, in their favour, it must be admitted that Foucault's personal life is a worthy subject of attention. He regularly made the issues that most troubled him personally—emotional suffering, exclusion, sexuality—the topics of his research. His critiques were often both theoretical and practical; he did not merely write about prisons, for example, but also organized protests against them.

Although he despised the label "homosexual," he was openly gay and occasionally praised the pleasures of sadomasochism and the bathhouse. He was something of a dandy, preferring to shave his head and dress in black and white. He declared that he had experimented with drugs. Even more scandalously (at least to the French), he declared that his favourite meal was "a good club sandwich with a Coke." Foucault cultivated his celebrity as "an all-purpose subversive," but neither his thought nor his life contains the substantive principles of an activist program. Foucault was skeptical of conventional wisdom and conventional moralism—but not without exception. He was an ironist—but not without restraint. He could be subversive and could admire subversion—but he was not a revolutionary. He dismissed even the possibility of providing an answer to Vladimir Ilich Lenin's great, abstract question "What is to be done?" Rather, he insisted upon asking, more concretely and more locally, "What, in a given situation, might be done to increase human capacities without simultaneously increasing oppression?" He was not confident that an answer would always be forthcoming. But whether the situation at hand was common or simply his own, he sought in all his endeavours to remove himself to a vista distant enough that the question might at least be intelligently posed. (J.F.)

Foucault pendulum, relatively large mass suspended from a long line mounted so that its perpendicular plane of swing is not confined to a particular direction and, in fact, rotates in relation to the Earth's surface. Jean-Bernard-Léon Foucault assembled (1851) in Paris the first pendulums of this type, one of which consisted of a 28-kilogram (62-pound) iron ball suspended from inside the dome of the Panthéon by a steel wire 67 m (220 feet) long and set in motion by drawing the ball to one side and carefully releasing it to start it swinging in a plane. The rotation of the plane of swing of Foucault's pendulums was the first laboratory demonstration of the Earth's spin on its axis.

While a Foucault pendulum swings back and forth in a plane, the Earth rotates beneath it, so that relative motion exists between them. At the North Pole, latitude 90° north, the relative motion as viewed from the plane of the pendulum's suspension is a counterclockwise rotation of the Earth once approximately every 24 hours. Correspondingly, the plane of the pendulum as viewed from the Earth looking upward rotates in a clockwise direction once a day. A Foucault pendulum always rotates clockwise in the Northern Hemisphere with a rate that becomes slower as the pendulum's location approaches the Equator. Foucault's

original pendulums at Paris rotated clockwise at a rate of more than 11° per hour, or with a period of about 32 hours per complete rotation. At the Equator, 0° latitude, a Foucault pendulum does not rotate. In the Southern Hemisphere, rotation is counterclockwise.

The rate of rotation of a Foucault pendulum can be stated mathematically as equal to the rate of rotation of the Earth times the sine of the number of degrees of latitude. Because the Earth rotates once a sidereal day, or 360° approximately every 24 hours, its rate of rotation may be expressed as 15° per hour, which corresponds to the rate of rotation of a Foucault pendulum at the North or South Pole. At latitude 30° north, for example, at Cairo or New Orleans, a Foucault pendulum would rotate at the rate of 7.5° per hour, for the sine of 30° is equal to one-half. The rate of rotation of a Foucault pendulum at any given point is, in fact, numerically equal to the component of the Earth's rate of rotation perpendicular to the Earth's surface at that point.

Fouché, Joseph, DUC (duke) D'OTRANTE (b. May 21, 1758?, Le Pellerin, near Nantes, France—d. Dec. 25, 1820, Trieste), French statesman and organizer of the police, whose efficiency and opportunism enabled him to serve every government from 1792 to 1815.

Fouché, engraving, 19th century
By courtesy of the Bibliothèque Nationale, Paris

Fouché was educated by the Oratorians at Nantes and Paris but was not ordained priest. On Sept. 16, 1792, he was elected deputy to the Convention where he sided first with the Girondins. At Louis XVI's trial he voted for the King's death; thereafter he grew closer to the Montagnards.

After war was declared on England (February 1793) Fouché was sent on several missions to ensure the loyalty of the provinces. Under the Directory (1795-99) Fouché was a Jacobin. After the coup d'état of Sept. 4, 1797, had excluded the royalists from legislative councils, he was made an envoy to Milan and then to The Hague.

On July 20, 1799, he became minister of police and warmly supported Napoleon Bonaparte's coup d'état of 18 Brumaire (Nov. 9, 1799). Thereafter he also organized the secret police. In June 1809 he became minister of the interior as well as of the police.

The prolonged wars and especially the Spanish rebellion made Fouché doubt the solidity of the empire, and from 1807 he began to intrigue, mainly with the royalists and with England. In July 1809, Fouché, on his own authority, ordered a levy of the national guard throughout France. This annoyed Napoleon, who dismissed him in October. He lived at Aix-en-Provence for three years. In order to get him out of France, Napoleon made him governor of the Illyrian Provinces (1812), and after the occupation of these provinces by the Austrians, he was sent on a mission to Naples.

After Napoleon's fall, Fouché was offered the Ministry of Police but refused, although he accepted it from Napoleon on his return from Elba. During the Hundred Days, Fouché recommended liberalism to Napoleon and kept on good terms with Louis XVIII and Austria. After Napoleon's second abdication Louis XVIII made Fouché minister of police, but the ultraroyalists soon forced his resignation. He was proscribed as a regicide on Jan. 5, 1816.

Fouquet, Nicolas: see Fouquet, Nicolas.

fouetté en tournant (French: "whipped turning"), spectacular turn in ballet, usually performed in series, during which the dancer turns on one foot while making fast outward and inward thrusts of the working leg at each revolution. After a preparatory turn in place on one leg, the dancer bends the knee of the supporting leg and extends the working leg out straight to the side (second position, *en l'air*). The dancer then brings the working leg in so that the toe touches the knee of the supporting leg for the turn. The turn is executed on the ball of the foot (*demi-pointe*) or toe (*pointe*; women only). Modern choreographers may require as many as 32 *fouettés en tournant*.

Fougasse (cartoonist): see Bird, (Cyril) Kenneth.

foulard, light silk fabric having a distinctive soft finish and a plain or simple twill weave. It is said to come originally from the Far East. In French the word *foulard* signifies a silk handkerchief.

The fabric, which is figured with a pattern printed in various colours, is used for dress material, handkerchiefs, scarves, and neckties. Fine textiles made from good-quality cotton yarn or man-made fibres are also sold as foulard and are used for the same purposes as the silk version.

Fould, Achille (b. Nov. 17, 1800, Paris—d. Oct. 5, 1867, La Loubière, Fr.), influential French statesman during the Second Republic (1848–52) and the Second Empire (1852–70). He combined liberal economic ideas with political flexibility, tempered by a belief in the necessity of repressing radical leftist leaders.

Foulques, also spelled FOULQUE (French personal name): see under Fulk, except as below.

Foulques DE TOULOUSE: see Folquet de Marseille.

Foulques, Gui (pope): see Clement IV.

foundation, philanthropic: see philanthropic foundation.

founder principle, in genetics, the principle whereby a daughter or migrant population may differ in genetic composition from its parent population because the original founders of the daughter population were not a representative sample of the parent population. For example, if there were a town in which some of the inhabitants were blue-eyed and some brown-eyed, and if because of a bad winter or a religious dispute a small group of these people, who all happened to be blue-eyed, decided to move away and found their own town, then their descendants in the new town would all be blue-eyed and in this respect would differ from the inhabitants of the old town. Some similar case may account for the fact that the American Indians have no blood type B in the ABO system, although the Mongoloid geographical race, from which the American Indians presumably derived, has blood type B.

foundling, the process of pouring molten metal into a cavity that has been molded according to a pattern of the desired shape. When the metal solidifies, the result is a cast-

ing—a metal object conforming to that shape. A great variety of metal objects are so molded at some point during their manufacture.

The most common type of mold is made of sand and clay; ceramics, sand with cement, metals, and other materials are also used for molds. These materials are packed over the face of the pattern (usually made of wood, metal, or resin) that forms the cavity into which the molten metal is to be poured. The pattern is removed from the mold when its shape is able to be retained by the mold material. Molds are usually constructed in two halves, and the two halves are joined together once the pattern has been removed from them. Pins and bushings permit precise joining of the two halves, which together are enclosed in a mold box. The metal is then poured into the mold through special gates and is distributed by runners to different areas of the casting. The mold must be strong enough to resist the pressure of the molten metal and sufficiently permeable to permit the escape of air and other gases from the mold cavity; otherwise, they would remain as holes in the casting. The mold material must also resist fusion with the molten metal, and the sand at the mold surface must be closely packed to give a smooth casting surface.

Mold box containing mold material and pattern

The making of patterns for foundries requires care and skill. Patterns are uniformly larger than the desired casting in order to compensate for shrinkage during drops of temperature and the liquid-to-solid phase change. Polystyrene foam patterns remain in the mold and evaporate upon contact with the poured metal; wax patterns are melted out of the mold prior to the pouring of the molten metal. Metal molds are used in that type of founding known as die-casting (*q.v.*). Often a hollow space is desired within the casting; in this case a core of fine sand is placed in one of the mold halves. Core boxes made of wood, metal, or resin are also used in this regard.

Modern foundries capable of large-scale production are characterized by a high degree of mechanization, automation, and robotics, and microprocessors allow for the accurate control of automated systems. Advances in chemical binders have resulted in stronger molds and cores and more accurate castings. Accuracy and purity are increased in vacuum conditions, and further advances are expected from zero-gravity casting in space.

fountain, in landscape architecture, an issue of water controlled or contained primarily for purposes of decoration, especially an artificial produced jet of water or the structure from which it rises.

Fountains have been an important element in the design of gardens and public spaces since ancient times. An early example is preserved in the carved Babylonian basin (*c.* 3000 BC) found at Tello, the ancient Lagash in Mesopotamia. An Assyrian fountain discovered in the gorge of the Comel River consists of basins cut in solid rock and descending in steps to the stream. Small conduits led the water from one basin to the other, the lowest of which was ornamented by two rampant lions in relief.

Greek. During the Aegean civilization, as in later Hellenic Greece, springs were frequently considered sacred and shrines were built around them, the water often emerging into artificial basins. In historic Greece, more high-

ly developed fountains existed; both literary references and excavated remains abound. Some were surrounded by columns, as at Lerna. The city of Corinth was noted for its fountains, particularly the spring dedicated to the nymph Pirene. Greek fountains were utilitarian as well, being provided with ample draw basins and reservoir supply and often shaded by a portico.

Roman. In Roman civilization, water was distributed from each terminal reservoir, or *castellum*, to baths and large houses as well as to many public fountains that supplied the bulk of the population. Examples uncovered at Pompeii illustrate both types, the more decorative courtyard fountain of the aristocratic house and the utilitarian public-street fountain. The latter consisted of a simple rectangular stone basin with a small pedestal above it carved with a human or animal head from whose mouth water flowed. The lip of the basin was notched for overflow.

In addition to the above types, the Romans developed the nymphaeum, a purely decorative type of fountain that originated in Hellenistic times. Roman nymphaea became monumental pleasure houses, often in the shape of an exedra covered by a half dome. The details of the fountain proper varied from multiple-basis arrangements to the jet of water issuing from a sculptured figure.

In early Christian times, fountains were placed in the atrium court of the Christian basilica as symbols of purification—*e.g.*, Old St. Peter's, Rome. Similar courtyard fountains continued to be used in the monasteries of western Europe and the Byzantine Empire (*e.g.*, Cluny; Vatopedi on Mount Athos).

Medieval European. In the early Middle Ages in Europe, ornamental and architectural treatment of fountains passed out of use; wells furnished the greater part of the necessary water. From the 12th century, however, public fountains began to reappear, and the spring fountains received architectural treatment. The usual form of the latter consisted of a large basin reached by a descending stairway and covered over with a vault, sometimes enclosed and sometimes supported only on piers. The public fountains of the medieval towns usually had a polygonal or circular basin, occasionally lobed, in the centre of which rose a column or pier carrying a series of spouts. The architectural details are of infinite variety. Fountains were a peculiar feature of the communal building activities of the late Middle Ages, often commissioned by guilds. Few of these survive. A noteworthy example is the Schöne Brunnen at Nürnberg (1398), distinguished by its high, rich Gothic spirelet with many statues and ironwork railing.

The late Middle Ages developed decorative table fountains as extravagant toys. Also, contemporary Byzantine court versions of table fountains running with spiced wines are

Water organ, Villa d'Este, Tivoli, Italy
O'Reilly—APA

recorded. Unfortunately no examples of this type have survived.

Islamic. The fountains of Muslim countries are of great importance, especially the public drinking fountains, called *sebeels*. They are an institution in the East. A common type is the simple spout and basin enclosed within a graceful niche. The more ambitious designs take the form of a richly decorated pavilion.

Renaissance and Baroque. The Renaissance in Italy began a new phase of fountain design in which sculpture became prominent. A common type was a sequence of circular or polygonal basins on a vertical support topped by a fountain figure from which water spouted. Leonardo da Vinci designed fountains. During the following period of the Italian Baroque, fountains became complex compositions of basins, sculpture, and water display. Rome is noted for its many fountains of baroque design, notably the Fountain of the Rivers (1648–51) in the Piazza Navona by Giovanni Bernini and the Trevi fountain (completed 1762) by Niccolò Salvi. Such fountains dramatized the rebuilding of the city, its piazzas, and its churches, done under papal direction.

In addition to these public fountains, the Italian development included an enormous number of original villa garden fountains of spectacular and sometimes amusing designs. Trick effects were made possible by elaborate mechanical devices. For example, the water organ at the Villa d'Este, Tivoli (1549), played only when certain pavement stones were stepped on. The hillside location of most villas was utilized, upper fountains supplying the lower ones in turn, as at the Villa d'Este and the cascade at Villa Aldobrandini, Frascati.

Italian precedent set the design for monumental civic fountains and for ornamental garden fountains in northern and western Europe.

An early example of an ornamental fountain in France is the Fountain of the Innocents (1550) in Paris by Jea Goujon, an original work that does not follow Italian models. The Medici fountain in the Luxembourg Garden in Paris by Salomon de Brosse is a fine example of the niche type. The most spectacular and ambitious fountains in France are those of Versailles, part of the vast garden complex designed by André Lenôtre (1661). Large reflecting pools were part of the axial scheme, and fireworks often accompanied the fountain display. Hardly secondary to the artistic achievement was the engineering feat of supplying water in volume and pressure to run the numerous fountains at Versailles. Purely ornamental fountains continued to be popular in the 18th century as focal points for civic design in large cities and as decoration for royal palaces and country seats.

Modern. Chatsworth in England was noted for its fountains designed by Sir Joseph Paxton in the 19th century, especially the single jet of water 260 ft (80 m) high issuing from a formal reflecting pool. Elsewhere at Chatsworth, a false willow tree of copper rained water on the unsuspecting beneath its branches.

In the 19th and 20th centuries fountains did not lose their popularity, although quality and imagination is less evident. Expositions have provided occasion for ambitious fountain displays. Among the many examples are the Crystal Palace at Sydenham, London; the World's Columbian Exposition at Chicago, Ill. (1893), and the New York World's Fair of 1939. At the Festival of Britain, London (1951), a mobile water sculpture composed of pivoted receptacles was set in motion by changing points of gravity. When each receptacle was filled, it would overturn only to right itself and be filled again with water from above. Of permanent fountains, a fine modern example, although derivative in design, is the Buckingham Memorial Fountain in Chicago (1927) by Jacques Lambert.

fountain moss: see water moss.

Fouqué, Friedrich Heinrich Karl de La Motte, Baron (b. Feb. 12, 1777, Brandenburg—d. Jan. 23, 1843, Berlin), German novelist and playwright remembered chiefly as the author of the popular fairy tale *Undine* (1811).

Fouqué, detail from an engraving by F. Fleischmann after a painting by W. Hensel, 1818

Historia-Photo

A descendant of French aristocrats, Fouqué in his writings expressed heroic ideals of chivalry designed to arouse a sense of German tradition and national character in his contemporaries during the Napoleonic era. His ideas, based on the view of linguistic development first conceived by the philosopher J.G. Fichte, stressed the influence of the mother tongue in shaping the mind.

A prolific writer, Fouqué gathered much of his material from Scandinavian sagas and myths. His dramatic trilogy, *Der Held des Nordens* (1808–10; "Hero of the North"), is the first modern dramatic treatment of the Nibelung story and a precedent for the later dramas of Friedrich Hebbel and the operas of Richard Wagner. His most lasting success, however, has been the story of Undine, a water sprite who marries the knight Hildebrand to acquire a soul and thus become human but who later loses this love to the treacheries of her uncle Kuhleborn and the lady Berthulda. Although Fouqué's works were at first enthusiastically received, after 1820 they rapidly passed out of fashion. Fouqué died in poverty after belated recognition by Frederick William IV.

Fouquet, Charles (-Louis-Auguste): see Belle-Isle, Charles (-Louis-Auguste) Fouquet de, duc de Gisors.

Fouquet, Jean (b. c. 1420, Tours, Fr.—d. c. 1481, Tours), preeminent French painter of the 15th century.

"Joshua and the Fall of Jericho" from Flavius Josephus' *Antiquités judaïques*, manuscript illuminated by Jean Fouquet, c. 1474; in the Bibliothèque Nationale, Paris (Ms. Fr. 247)

By courtesy of the Bibliothèque Nationale, Paris

Little is known of Fouquet's early life, but his youthful work suggests that he was trained in Paris under the Bedford Master. His portrait of Charles VII (c. 1447; Louvre, Paris), though a panel painting, displays the use of brittle, incisive line characteristic of miniature painting. This work must have helped to establish his international reputation for, before 1447, he executed in Rome the portrait of Pope Eugenius IV. While in Italy he absorbed the progress that such painters as Masaccio, Fra Angelico, and Piero della Francesca had made in the handling of central perspective and foreshortening and in the rendering of volume.

Upon his return to Tours, Fouquet created a new style, combining the experiments of Italian painting with the exquisite precision of characterization and detail of Flemish art. For the royal secretary and lord treasurer, Étienne Chevalier, he executed between 1450 and 1460 his most famous works: a large *Book of Hours* with about 60 full-page miniatures, 40 of which are among the great treasures of the château of Chantilly; and the diptych from Notre Dame at Melun (c. 1450) with Chevalier's portrait (Staatliche Museen Preussischer Kulturbesitz, Berlin) on one panel and a Madonna with the features of Agnès Sorel, the King's mistress (Musée Royal des Beaux-Arts, Antwerp), on the other. Also to this period of the reign of Charles VII belong the two richly illuminated manuscripts of a French translation of Boccaccio's *De casibus virorum illustrium* ("On the Fates of Famous Men") and *De claris mulieribus* ("On Famous Women"), *Cas des nobles hommes et femmes malheureux* (1458, Bayerische Staatsbibliothek, Munich), and a copy of the *Grandes Chroniques de France* (Bibliothèque Nationale, Paris); and finally, the large altarpiece of the "Pietà" discovered in the church at Nouans, his only monumental painting.

In 1469 King Louis XI founded the Order of St. Michael, and Fouquet illuminated the statutes of the order (Bibliothèque Nationale, Paris). In 1474 he worked with the sculptor Michel Colombe on the design of the King's tomb and in the following year received the official title of royal painter. About the same time he completed the illustration of two volumes of a French translation of Josephus' *Antiquities of the Jews* (Bibliothèque Nationale, Paris), in which he broadened the range of miniature painting to include vast panoramas of architecture and landscape, making brilliant use of aerial perspective and colour tonality to achieve compositional unity. Fouquet's work consistently displays clear, dispassionate observation rendered with intricate delicacy and alternates accurate perspective with a flat, non-illusionistic sense of space.

Fouquet, Nicolas, Fouquet also spelled FOUQUET (b. 1615, Paris—d. March 23, 1680, Pignerol, Fr.), French finance minister in the early years of the reign of Louis XIV, the last *surintendant* (as opposed to *contrôleur général*), whose career ended with his conviction for embezzlement.

Born the son of a wealthy shipowner and royal administrator, Fouquet was a supporter of the powerful Cardinal Mazarin and of the royal government during the turmoil of the Fronde (1648–53). He purchased the post of *procureur général* to the Parlement of Paris in 1650, and in 1653 he was appointed *surintendant des finances*. To aid Mazarin, who in return upheld him, Fouquet lent considerable sums to the treasury, making himself, in effect, banker to the King; his numerous financial operations, which he conducted in an irregular way (though not contrary to the usage of the times), made him extremely rich.

After Mazarin's death (March 1661), Jean-

Baptiste Colbert, Mazarin's personal *intendant* and closest confidant, sought to succeed Fouquet as finance minister by destroying his reputation with the King. Colbert revealed irregularities in Fouquet's accounts and denounced the financial operations by which he had enriched himself. Fouquet was arrested in September 1661, and his trial, which lasted three years, excited great public interest. Colbert suppressed the papers that would have proved Mazarin's personal responsibility for many of the financial transactions in question, but Fouquet defended himself cleverly, and public opinion turned in his favour. On Dec. 20, 1664, he was condemned to banishment,

Fouquet, engraving by R. Nanteuil, 1661

By courtesy of the Bibliothèque Nationale, Paris

but Louis XIV "commuted" the sentence to life imprisonment. Fouquet was taken to the fortress of Pignerol, where he died just before a measure of clemency could be issued.

Fouquier-Tinville, Antoine-Quentin (b. June 10, 1746, Hérouel, Picardy, Fr.—d. May 7, 1795, Paris), French Revolutionary lawyer who was public prosecutor of the Revolutionary Tribunal during the Reign of Terror.

A friend and relative of the journalist Camille Desmoulins, Fouquier-Tinville early supported the Revolution and rose from minor legal offices to the rank of assistant public prosecutor of the criminal tribunal in Paris (1793). In March 1793 he was appointed public prosecutor of the Revolutionary Tribunal, and he became a dominant figure during the Reign of Terror. Hardworking and ruthless, he claimed to have prosecuted more than 2,400 counterrevolutionaries, including Marie-Antoinette, Desmoulins, the Girondins, and the Hébertists. After Robespierre's fall from power, the Thermidorians tried Fouquier-Tinville and sentenced him to the guillotine. In his unsuccessful trial defense, Fouquier-Tinville denied any personal acts of violence and claimed that he had merely obeyed the orders of the Revolutionary government's committees.

four-colour map problem, problem in topology, originally posed in the early 1850s and not solved until 1976, that required finding the minimum number of different colours required to colour a map such that no two adjacent regions (*i.e.*, with a common boundary segment) are of the same colour. Three colours are not enough, as can be seen in a map of four regions with each region contacting three other regions. It had been proved mathematically that five colours will always suffice; and no map had ever been found empirically on which four colours would not do. As is often the case in mathematics, consideration of the problem provided the impetus for the discov-

Four-colour map problem

ery of related results in topology and combinatorics. A similar problem had been solved for the seemingly more complicated situation of a map drawn on a torus (doughnut-shaped surface), where seven colours were known to be the minimum.

The four-colour problem was solved in 1976 by a group of mathematicians at the University of Illinois, directed by Kenneth Appel and Wolfgang Haken, which after four years had completed an unprecedented synthesis of computer search and theoretical reasoning.

Appel and Haken created a catalog of 1,936 "unavoidable" configurations that must be present in any graph, no matter how large. Then they showed how each of these configurations could be reduced to a smaller one so that, if the smaller one could be coloured with four colours, so could the original catalog configuration. Thus, if there were a map that could not be coloured with four colours, they could use their catalog to find a smaller map that also could not be four-coloured, and then a smaller one still, and so on. Eventually this reduction process would lead to a map with only three or four regions that, supposedly, could not be coloured with four colours. This absurd result, which is derived from the hypothesis that a map requiring more than four colours might exist, leads to the conclusion that no such map can exist. All maps are in fact four-colourable.

The strategy involved in this proof dates back to 1879 when the British mathematician A.B. Kempe produced a short list of unavoidable configurations and then showed how to reduce each to a smaller case. Appel and Haken replaced Kempe's brief list with their catalog of 1,936 cases, each involving up to 500,000 logical options for full analysis. Their complete proof, itself several hundred pages long, required more than 1,000 hours of computer calculations.

four-eyed fish, either of two species of tropical American river fishes of the genus *Anableps* (family Anablepidae, order Atheriniformes). Four-eyed fishes are surface dwellers and have eyes adapted for seeing both above and below the water surface. The eyes are on top of the head, and each is divided into two parts, an upper half for vision in air, and a lower half for vision in water; hence, the common name. The fish grow to a maximum length of about 30 centimetres (one foot).

four-footed butterfly: *see* brush-footed butterfly.

Four Freedoms, a formulation of worldwide social and political objectives by U.S. President Franklin D. Roosevelt in the State of the Union message he delivered to Congress on Jan. 6, 1941. Roosevelt stated these freedoms to be the freedom of speech and expression, the freedom of every person to worship God in his own way, the freedom from want, and the freedom from fear. Roosevelt called for ensuring the latter through "a world-wide reduction of armaments to such a point and in

such a thorough fashion that no nation will be in a position to commit an act of physical aggression against any neighbor—anywhere in the world."

4-H Club, one of an organization of clubs for youth aged 10 to 21 who engage in programs of "learning by doing." The clubs are found principally in the United States and Canada, though some 80 other nations have adopted the idea. The 4-H Club emblem is the four-leaf clover with the letter H on each leaf; the club colours are green and white. The name 4-H is suggested in the pledge:

I pledge
My Head to clearer thinking,
My Heart to greater loyalty,
My Hands to larger service, and
My Health to better living, for
My Club, my Community, and my Country.

The clubs originated among rural youth in the United States in the early years of the 20th century, the name 4-H Club being generally accepted by 1924. Adult supervisors in the United States are recruited and trained by the extension services of the land-grant colleges and universities, as well as the U.S. Department of Agriculture and county governments, which cooperate under provisions of the Smith-Lever Act of 1914 and subsequent acts of Congress and the state legislatures.

Four-H clubs are no longer limited to rural youth; enrollment is approximately 50 percent farm, 30 percent rural nonfarm, and 20 percent urban. Each local club—they vary in size but average 24 members—elects its own officers and plans and carries on its program with the guidance and instruction of one or more adult leaders, assisted by junior leaders. More than 50 different projects may be undertaken by 4-H members. For example, among agricultural activities that may be carried on in accordance with recognized approved practices are growing a field crop; raising a garden or a flock of poultry; purchasing, breeding, and caring for a sow and her litter of pigs; raising a dairy calf to maturity and building a dairy herd; feeding and fattening for market one or more beef steers; or running and maintaining tractors and other farm machinery. Typical projects developed for urban as well as rural youngsters are automotive care and safety; dog care and training; electrical and electronic work; indoor gardening; operation of power lawn equipment; and safety work. Projects in home economics include such basic activities as food preparation, sewing, and home furnishing.

A major annual event in the United States is the National 4-H Club Congress, to which members are named delegates as rewards for outstanding records of achievement in 4-H Club work. This event is conducted jointly by the cooperative extension service and the National Committee on Boys and Girls Club Work, Inc. The committee, which publishes *National 4-H News*, a monthly magazine, and provides incentives for meritorious 4-H work, is a privately supported voluntary group of citizens, incorporated not for profit.

Four-Handed Chess, board game, a variant of Chess played by four people in partnerships of two. The pieces generally move as in conventional Chess. Partners do not capture each other's pieces but do take those of their opponents and attempt to checkmate both opposing Kings.

In one form of the game, a conventional board is used, with each player controlling a King, Bishop, Knight, Rook, and four Pawns. The pieces begin in the corners of the board, with partners diagonally opposite one another. When one partner loses his King, the other takes command of his remaining forces. Play is roughly similar to that of Shaturanga, an ancient Indian predecessor of Chess.

In another form of the game, a special 160-

Four-Handed Chess

square board is used (a conventional board with three-row extensions of all four sides). Each player has a complete set of chessmen, and players on opposite sides of the board are partners. Pawns move one square only at all times, reverse direction upon reaching the allied last rank, and become Queens upon reaching an opponent's last rank (by capturing). A player must aid his partner's King, if it is threatened. If he cannot, the King may be removed and its companion pieces joined in defense of the partnership's remaining King. In another version, when a player is checkmated, his partner continues alone without the aid of the other's pieces, although they may not be captured or moved. If the checkmate is relieved, the player and his pieces may return to the game.

Four Horsemen, name given by the sportswriter Grantland Rice to the backfield of the University of Notre Dame's undefeated football team of 1924: Harry Stuhldreher (quarterback), Don Miller and Jim Crowley (halfbacks), and Elmer Layden (fullback). Supported by the Seven Mules and coached by Knute Rockne, they gained enduring football fame when the nickname appeared in Rice's report in the *New York Herald Tribune* describing Notre Dame's 13-7 victory over Army on Oct. 18, 1924. A photograph of the four, dressed in football uniforms and mounted on horses, caught the fancy of fans. The Four Horsemen and their teammates lost only 2 of 30 games played from 1922 to 1924.

Four Masters of Anhwei, group of Chinese artists who were born and worked in Anhwei (also An-hui, or Hsin-an) Province in the 17th century (Ch'ing dynasty) and who, being somewhat remote from the traditional centres of Chinese painting, developed rather unusual styles. The Four Masters are generally identified as the little-known artists Sun

"The Coming of Autumn," hanging scroll by Hung-jen (1610-63), one of the Four Masters of Anhwei, Ch'ing dynasty, ink on paper; in the Honolulu Academy of Arts

Wilhelmina Tenney Memorial Collection, Honolulu Academy of Arts

I and Wang Chih-jui, and the famous artists Hung-jen (*q.v.*) and Ch'a Shih-piao. Two other well-known artists of Anhwei Province—Hsiao Yün-ts'ung and Mei Ch'ing—are often substituted for the former two artists. The landscape paintings of the masters of Anhwei Province often depict the somewhat peculiar landscape features of the province—especially Huang Shan (Yellow Mountain). Their style is commonly quite spare and even brittle, revealing a certain similarity to the reticent style of the

14th-century painter Ni Tsan (*q.v.*), one of a group of painters known as the Four Masters of the Yüan Dynasty (*q.v.*).

Four Masters of the Yüan Dynasty, Chinese painters who worked during the Yüan period (1206-1368) and were revered in the Ming dynasty and later as major exponents of the tradition of "literati painting" (*wen-jen-hua; [q.v.]*), which was concerned more with individual expression and learning than with outward representation and immediate visual appeal.

"A Quiet Life in a Wooded Glen," hanging scroll by Wang Meng (1308-85), one of the Four Masters of the Yüan Dynasty, ink and colour on paper; in the Art Institute of Chicago

By courtesy of the Art Institute of Chicago, Kate S. Buckingham Collection

Two of the Four Masters were Huang Kung-wang and Wu Chen (*qq.v.*), who, being of the earlier generation of artists in the Yüan, more consciously emulated the work of ancient masters, especially those pioneering artists of the Five Dynasties period such as Tung Yüan and Chü-jan (*q.v.*), who rendered landscape in a broad, almost Impressionistic manner, with coarse brushstrokes and wet ink washes. While these painters were also revered by the two younger Yüan masters, the restrained thinness of Ni Tsan (*q.v.*) and the almost embroidered richness of Wang Meng (*q.v.*) could not be more different from the work of the older Yüan masters.

Thus, with the Four Masters, all of whom were noted for their lofty personal and aesthetic ideals, the art of landscape painting shifted from an emphasis on close representation of nature to a personal expression of nature's qualities, with a new attention to the vocabulary of brush manipulation.

Four Noble Truths, Pāli CATTĀRI-ARIYA-SACCĀNI, Sanskrit CATVĀRI-ĀRYA-SATYĀNI, the essence of Buddhist religious doctrine, expounded by Gautama Buddha in his first sermon at the deer park near Benares (Vārāṇasi), India, shortly after his having attained Enlightenment. The four truths are: (1) that existence is suffering (*dukkha*); (2) that this suffering has a cause (*samudaya*); (3) that it can be suppressed (*nirodha*); and (4) that there is a way (*magga*) to accomplish this, the noble Eightfold Path (*q.v.*).

These four truths are universally recognized by Buddhist schools. The causes of suffering are expressed in a formula of 12 interdependent stages (the *paṭicca-samuppāda*) that form an infinitely repeating cycle of coming and becoming. The breaking of this cycle constitutes freedom from rebirth and the cessation of suffering.

four-o'clock, also called MARVEL-OF-PERU, or BEAUTY-OF-THE-NIGHT (*Mirabilis jalapa*), ornamental perennial plant, of the family Nyctaginaceae, native to tropical America. Four-o'clock is a quick-growing species up to one metre (three feet) tall, with oval leaves on short leafstalks. The stems are swollen at the joints. The plant is called four-o'clock because its flowers, from white and yellow to shades

of pink and red, sometimes streaked and mottled, open in late afternoon (and close by morning).

Four Wangs, Chinese landscape painters, members of the group known as the Six Masters of the early Ch'ing period (*q.v.*).

Fourdrinier machine, device for producing paper, paperboard, and other fibreboards, consisting of a moving endless belt of wire or plastic screen that receives a mixture of pulp and water and allows excess water to drain off, forming a continuous sheet for further drying by suction, pressure, and heat. Calenders (rollers or plates) smooth the paper or board and impart gloss or other desired finish to the surface. The first machine to produce a continuous web (roll), the Fourdrinier machine was invented in France in 1799 by Louis Robert and was subsequently improved in England, where it was patented by Henry and Sealy Fourdrinier.

Fourier, (François-Marie-)Charles (b. April 7, 1772, Besançon, Fr.—d. Oct. 10, 1837, Paris), French social theorist who advocated a reconstruction of society based on communal associations of producers known as phalanges (phalanxes). His system came to be known as Fourierism.

While working as a clerk in Lyon, Fourier

wrote his first major work, *Théorie des quatre mouvements et des destinées générales* (1808; *The Social Destiny of Man; or, Theory of the*

Charles Fourier, engraving by Samuel Sartain after a painting by Jean-François Gigoux

Culver Pictures

Four Movements, 1857). He argued that a natural social order exists corresponding to Newton's ordering of the physical universe and that both evolved in eight ascending periods. In harmony, the highest stage, man's emotions would be freely expressed. That stage could be created, he contended, by dividing society into phalanges.

The phalange, in Fourier's conception, was to be a cooperative agricultural community bearing responsibility for the social welfare of the individual, characterized by continual shifting of roles among its members. He felt that phalanges would distribute wealth more equitably than under capitalism and that they could be introduced into any political system, including a monarchy. The individual member of a phalange was to be rewarded on the basis of the total productivity of the phalange.

After inheriting his mother's estate in 1812, Fourier was able to devote himself exclusively to writing and refined his theories in *Traité de l'association agricole domestique* (1822; "Treatise on Domestic Agricultural Association") and *Le Nouveau Monde industriel* (1829-30; "The New Industrial World"). His emphasis on adapting society to human needs and on the wastefulness of the competitive capitalist system foreshadowed the ideas of Karl Marx.

Cooperative settlements based on Fourier's ideas were started in France and especially the U.S., among which the best known were the short-lived Brook Farm in Massachusetts (1841-46) and the North American Phalanx at Red Bank, N.J.

Fourier, (Jean-Baptiste-)Joseph, Baron (b. March 21, 1768, Auxerre, Fr.—d. May 16, 1830, Paris), French mathematician, known

Graudon—Art Resource/EB Inc

also as an Egyptologist and administrator, who exerted strong influence on mathematical physics through his *Théorie analytique de la chaleur* (1822; *The Analytical Theory of Heat*). He showed how the conduction of heat in solid bodies may be analyzed in terms of infinite mathematical series now called by his name, the Fourier series. Far transcending the particular subject of heat conduction, his work stimulated research in mathematical physics, which has since been often identified with the solution of boundary-value problems, encompassing many natural occurrences such as sunspots, tides, and the weather. His work also had a great influence on the theory of functions of a real variable, one of the main branches of modern mathematics.

Fourier, the son of a tailor, first attended the local military school conducted by Benedictine monks. He showed such proficiency in mathematics in his early years that he later became a teacher in mathematics at the same school. The ideals of the French Revolution then swept him into politics, and more than once his life was in danger. When the École Normale was founded in 1794 in Paris, he was among its first students, and, in 1795, he became a teacher there. The same year, after the École Polytechnique was opened, he joined its faculty and became a colleague of Gaspard Monge and other mathematicians.

In 1798, with Monge and others, Fourier accompanied Napoleon on his expedition to Egypt. Until 1801 he was engaged in extensive research on Egyptian antiquities, gave advice on engineering and diplomatic undertakings, and served for three years as the secretary of the Institut d'Égypte, which Napoleon established in Cairo in 1798.

After his return to France, Fourier was charged with the publication of the enormous mass of Egyptian materials. This became the *Description de l'Égypte*, to which he also wrote a lengthy historical preface on the ancient civilization of Egypt. He was also appointed prefect (administrator for the national government and *département*) of the Isère *département*, a position he held from 1802 to 1814, with his headquarters at Grenoble. He showed great administrative ability, as in directing the drainage of swamps, while continuing his Egyptological and mathematical work. In 1809 Napoleon made him a baron. Following Napoleon's fall from power in 1815, Fourier was appointed director of the Statistical Bureau of the Seine, allowing him a period of quiet academic life in Paris. In 1817 he was elected to the Académie des Sciences, of which, in 1822, he became perpetual secretary. Because of his work in Egyptology he was elected in 1826 to the Académie Française and the Académie de Médecine.

Fourier began his work on the *Théorie analytique de la chaleur* in Grenoble in 1807 and completed it in Paris in 1822. His work enabled him to express the conduction of heat in two-dimensional objects (*i.e.*, very thin sheets of material) in terms of the differential equation

$$\frac{\partial u}{\partial t} = k \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right]$$

in which u is the temperature at any time t at a point (x, y) of the plane and k is a constant of proportionality called the diffusivity of the material. The problem is to find the temperature, for example, in a conducting plate, if at time $t=0$, the temperature is given at the boundary and at the points of the plane. For the solution of such problems in one dimension, Fourier introduced series with sines and cosines as terms:

$$y = \frac{1}{2}a_0 + (a_1 \cos x + b_1 \sin x) + (a_2 \cos 2x + b_2 \sin 2x) + \dots$$

Such Fourier series, already occasionally used by Leonhard Euler and other 18th-century

mathematicians, but somewhat distrusted, received through Fourier their important position in modern mathematics. He also extended this concept into the so-called Fourier integral. Doubts of the validity of the Fourier series, which led later mathematicians to a fundamental renewal of the concept of real function, were resolved by P.G.L. Dirichlet, Bernhard Riemann, Henri Lebesgue, and others.

Fourier worked on the theory almost his entire life. He was also interested in the determination of roots of algebraic equations (the so-called theorem of Fourier). (D.J.S.)

Biography. 1. Grattan-Guinness, *Joseph Fourier, 1768-1830* (1972), is a magnificent study dealing with Fourier's mathematical physics and includes an exhaustive bibliography.

Fourier transform, in mathematics, a particular integral transform. As a transform of an integrable complex-valued function f of one real variable, it is the complex-valued function \hat{f} of a real variable defined by the following equation

$$\hat{f}(\xi) = (2\pi)^{-1/2} \int_{-\infty}^{\infty} e^{-i\xi x} f(x) dx.$$

In the integral equation

$$f(y) = \int_{-\infty}^{\infty} K(x,y) F(x) dx,$$

the function $f(y)$ is an integral transform of $F(x)$, and $K(x,y)$ is the kernel. Often the reciprocal relationship is valid:

$$F(y) = \int_{-\infty}^{\infty} K'(x,y) f(x) dx.$$

See integral transform.

Fourierism, philosophy of social reform developed by the French social theorist Charles Fourier that advocated the transformation of society into self-sufficient, independent "phalanges" (phalanxes). One of several utopian socialist programs to emerge in the second quarter of the 19th century, Fourierism was transplanted to the United States by Albert Brisbane, who renamed it "Associationism."

Brisbane's ideas were popularized by Horace Greeley in the pages of the *New York Tribune*, and shortly thereafter a number of communal groups—phalanxes—were established. The best known was Brook Farm (q.v.), near Boston, founded by George Ripley in 1841. Brook Farm lasted until 1847, but the average duration of the nearly 50 other phalanxes in the United States was just two years.

Based on an agrarian-handicraft economy, the phalanx consisted of about 1500 people. Work was voluntary and goods produced were the property of the phalanx. But members were paid an hourly wage (the scale escalating according to the disagreeableness of the task), and private property and inheritance were permitted. Fourier's premise was that people could live harmoniously in a state of nature, free of government intervention. Transcendentalists found much to admire in Fourierism, and true believers predicted that eventually the entire world would be organized into phalanxes.

Fourneyron, Benoît (b. Oct. 31, 1802, Saint-Étienne, Fr.—d. July 31, 1867, Paris), French inventor of the water turbine.

The son of a mathematician, he graduated in the first class of the new Saint-Étienne engineering school in 1816. While working

in the ironworks at Le Creusot, he studied a proposal advanced by his former professor, Claude Burdin, for a new type of waterwheel that Burdin named a "turbine." Though neither the Academy of Sciences nor the Society for the Encouragement of Industry accepted Burdin's paper, Fourneyron recognized its importance and undertook its realization. He built in 1827 a small, six-horsepower unit in which water was directed outward from a central source onto blades or vanes set at angles in a rotor.

By 1837 Fourneyron had produced a turbine capable of 2,300 revolutions per minute, 80 percent efficiency, and 60 horsepower, with a wheel a foot in diameter and weighing only 40 pounds (18 kilograms). Besides its more obvious advantages over the waterwheel, Fourneyron's turbine could be installed as a horizontal wheel with a vertical shaft. It achieved immediate international success, powering industry in continental Europe and in the United States, notably the New England textile industry. But the real significance of the invention did not emerge until 1895, when Fourneyron turbines were installed on the American side of Niagara Falls to turn generators for electric-power production.

Fourneyron perceived the potential of steam-driven turbines, but his attempts to make a satisfactory steam turbine were thwarted by the inadequacy of available materials and workmanship.

Fournier, Henri-Alban: see Alain-Fournier.

Fournier, Jacques (pope): see Benedict XII.

Fournier, Pierre-Simon (b. Sept. 15, 1712, Paris—d. Oct. 8, 1768, Paris), French engraver and typefounder particularly noted for decorative typographic ornaments reflecting the Rococo spirit of his day.

Trained as an artist, at 17 he went to work in a typefoundry, where he learned to cut punches and to engrave ornaments. He set up his own typefoundry in Paris in 1736. He designed many new characters, and the fame of his foundry spread beyond his native France. His *Table des proportions qu'il faut observer entre le caractères* (1737) was followed by several other technical treatises, including *Modèles de caractères* (1742), which presented his entire range of typefaces. His principal work is *Manuel typographique* (2 vol., 1764-66), the first volume of which deals with punch cutting and typefounding; the second is devoted largely to type specimens, with many pages of ornaments.

Fourteen Points (Jan. 8, 1918), declaration by U.S. Pres. Woodrow Wilson during World War I outlining his proposals for a postwar peace settlement.

On Jan. 8, 1918, President Wilson, in his address to the joint session of the United States Congress, formulated under 14 separate heads his ideas of the essential nature of a post-World War I settlement. The text of the Fourteen Points is as follows:

1. Open covenants of peace, openly arrived at, after which there shall be no private international understandings of any kind but diplomacy shall proceed always frankly and in the public view.

2. Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.

3. The removal, so far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.

4. Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.

5. A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined.

6. The evacuation of all Russian territory and such a settlement of all questions affecting Russia as will secure the best and freest coöperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy and assure her of a sincere welcome into the society of free nations under institutions of her own choosing; and, more than a welcome, assistance also of every kind that she may need and may herself desire. The treatment accorded Russia by her sister nations in the months to come will be the acid test of their good will, of their comprehension of her needs as distinguished from their own interests, and of their intelligent and unselfish sympathy.

7. Belgium, the whole world will agree, must be evacuated and restored, without any attempt to limit the sovereignty which she enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is forever impaired.

8. All French territory should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which has unsettled the peace of the world for nearly fifty years, should be righted, in order that peace may once more be made secure in the interest of all.

9. A readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality.

10. The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.

11. Rumania, Serbia, and Montenegro should be evacuated; occupied territories restored; Serbia accorded free and secure access to the sea; and the relations of the several Balkan states to one another determined by friendly counsel along historically established lines of allegiance and nationality; and international guarantees of the political and economic independence and territorial integrity of the several Balkan states should be entered into.

12. The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

13. An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

14. A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike.

On Oct. 3-4, 1918, Prince Maximilian of Baden, the German imperial chancellor, sent a note, via Switzerland, to President Wilson, requesting an immediate armistice and the opening of peace negotiations on the basis of the Fourteen Points. Germans would later argue a "betrayal" when faced by the harsher terms of the Armistice and the Treaty of Versailles.

Fourth International (Socialist federation): see International, Fourth.

Fourth of July: see Independence Day.

foussa (mammal): see fossa.

Fouta, also called FUTA, or FOUTA-TORO, semidesert region flanking the middle course of the Sénégal River and lying north of the Ferlo region, in northern Senegal. The banks of the Sénégal River are well-watered and fertile in the Fouta region, yet the thin, sandy clay of the region's interior plains is infertile and porous. Water is found near the surface in only a few shallow depressions. This region was historically the site of several Fula states. Many of the Fulani and Mauri people who inhabit the region have switched from nomadic to sedentary lifestyles.

Fouta Djallon, also spelled FUTA JALLON, mountainous region of west-central Guinea. Consisting of a series of stepped sandstone plateaus with many picturesque trenches and gorges, the region serves as the watershed for some of western Africa's greatest rivers. The Fouta Djallon covers an area of 30,000 square miles (77,000 square km) and averages 3,000 feet (914 m) in elevation. Mount Loura (Tangué), its highest point (5,046 feet [1,538 m]), rises near the town of Mali. Originating in the Fouta Djallon's central plateau are the headwaters of the Gambia, Bafing (Sénégal), Koliba, Kolenté (Great Scarcies), Kaba (Little Scarcies), and Konkouré rivers. The Fouta's eastern slopes feed various tributaries of the Niger River; and its extension to the extreme southeast, known as the Guinea Highlands (*q.v.*), contains the Niger's source.

The Fouta Djallon's name comes from its early Dialonke (Djallonke) inhabitants. The region was first organized as a separate political entity as a result of the Fulbe and Malinke jihad (Muslim holy war) led by Karamoko Alfa and Ibrahima Sori in the late 1720s. As a Muslim theocratic state, Fouta Djallon dominated both central and coastal Guinea until it became part of the French colony of Guinea. Timbo, 26 miles (42 km) northeast of Mamou, was the seat of the Fulani emirs until its occupation by French troops in 1896. Modern Fouta Djallon is mainly inhabited by Muslim Fulani peoples who herd tsetse-resistant Ndama cattle. The town of Labé is the chief trade centre.

Fowey, English Channel port, Restormel district, county of Cornwall, England. Fowey lies on the west bank of the sheltered Fowey Estuary. It held a leading position among Cornish ports from the 14th to the 16th century, owing to the export of tin. The area's tin mines closed by the late 20th century, but the port continued to export china clay quarried locally at Saint Austell. Pop. (1991) 1,939.

fowl, also called POULTRY, in animal husbandry, birds raised commercially or domestically for meat, eggs, and feathers. Chickens, ducks, turkeys, and geese are of primary commercial importance, while guinea fowl and squabs are chiefly of local interest.

A brief treatment of poultry follows. For full treatment of poultry production, see MACROPAEDIA: Farming and Agricultural Technology. For treatment of the nutrient composition and processing of poultry, see Food Processing.

Chickens are descended from the wild red jungle fowl of India and belong to the species *Gallus gallus*. They have been domesticated for at least 4,000 years. Only in about 1800, however, did chicken meat and eggs start to become mass-production commodities. Modern high-volume poultry farms, with rows of cages stacked indoors for control of heat, light and humidity, began to proliferate in Great Britain around 1920 and in the United States after World War II. The females (mature

hens and younger pullets) are raised for meat and for their edible eggs; farmers have developed numerous breeds and varieties to fulfill commercial requirements. Mature males (cocks, or roosters) have long been used for sport (now outlawed in many jurisdictions), but most immature males (cockerels) are castrated (in modern times usually chemically, with hormones that cause atrophy of the testicles) to become meat birds, called capons. Originally, meat production was a by-product of egg production. Only hens that could no longer produce enough eggs were killed and sold for meat. By the mid-20th century, however, meat production had outstripped egg production as a specialized industry.

Domestic ducks belong to the subfamily Anatinae of the waterfowl family Anatidae. The Muscovy duck (*Cairina moschata*) and wild mallard (*Anas platyrhynchos*) are believed to be the ancestors of all domestic ducks. The Muscovy duck was domesticated in Colombia and Peru by the pre-Columbian Indians. The mallard was domesticated in China about 2,000 years ago and has undergone numerous crossbreedings and mutations. Technically, the term duck applies to the female, the male being called a drake. Duck raising is practiced on a limited scale in most countries, usually as a small-farm enterprise, although large flocks are bred in some areas of England, The Netherlands, and the United States. The American Poultry Association lists 12 domesticated breeds, divided into three classes: meat producing, egg producing, and ornamental. The White Peking, originally from China, is the most widely used because it is meaty, fast growing, and prodigious in egg production. Duck feathers are also of some value, though they have been largely replaced by synthetics. Eiderdown is still of wide commercial value for use in luxury quilts and pillows.

Turkeys, members of the family Meleagrididae (order Galliformes), are the largest game

birds native to North America. The Aztec and Zuni Indians domesticated them for food and sacrifice and used their feathers for decoration. In 1519 the Spanish brought the Mexican species back to Europe. Turkeys began to be raised for meat on a wide scale after World War II. Generally speaking, male turkeys (called stags, or toms) reach market weight (up to 12 kg [26 pounds]) in about 26 weeks, while hen turkeys mature earlier and rarely exceed 9–10 kg (20–22 pounds).

Geese, members of the family Anatidae, are described as domesticated in the earliest biblical writings. Modern breeds are mostly descended from the greylag (*Anser anser*), a wild goose of northern Eurasia. Unlike its monogamous wild cousin, the domestic goose is polygamous and thus more productive for commercial uses. The largest and most popular domestic meat goose is the Toulouse. In Great Britain, geese of just under one year of age are popularly roasted as Christmas fare. A by-product of goose-meat production especially important in Europe is pâté de foie gras, a paste made from the enlarged and fattened livers of force-fed geese. Goose feathers and down provide high-quality insulation in quilts and pillows and, more recently, sleeping bags and coats.

Native to Africa and southern Madagascar, guinea fowl (*Numida*) belong to the family Numididae and are closely related to the chicken. Raised as a sideline on farms in many countries, their food conversion is poor, but they need little care or attention.

Squabs are immature pigeons, members of the family Columbidae. Squab production is carried on locally but is rare in most countries with established poultry industries.

Fowler, H(enry) W(atson) (b. March 10, 1858, Tonbridge, Kent, Eng.—d. Dec. 26, 1933, Hinton St. George, Somerset), English lexicographer and philologist whose works on the use and style of the English language had

Best-known breeds of domesticated fowl

name and type	distribution	appearance	characteristics
chicken			
Australorp (eggs)	originally Australia, now also U.K.	black plumage, rather long back	breed includes Black Australorp variety
Cornish (meat and eggs)	U.K. and U.S.	very heavy for its size, compact body	Rock Cornish hens are killed at six weeks
Leghorn (eggs)	Mediterranean breed	stylish carriage, yellow beak and skin	numerous varieties
New Hampshire (meat)	developed in U.S.	blocky, medium-length body	bred from Rhode Island Red stock
Orpington (meat)	English breed	long, deep, well-rounded body	buff, black, white, and blue varieties
Plymouth Rock (meat and eggs)	developed in U.S.	long, fairly broad body	several varieties
Rhode Island Red (meat and eggs)	U.S. breed	red colour, long rectangular body	general-purpose breed
Sussex (meat)	English breed	long body, broad shoulders	excellent meat producer
Wyandotte (meat and eggs)	U.S. breed	round, low-set body with short back	several varieties
duck			
Aylesbury (meat)	English breed	white feathers and skin, orange feet	excellent meat producer
Indian Runner (eggs)	originally East Indies, now western Europe	orange feet and shanks, erect body	white, white penciled, fawn varieties
Khaki Campbell (eggs)	developed in England	colour is khaki and bronze	breed has set egg-production records
Muscovy duck (meat)	originally South America	long, low, white body, orange feet	numerous varieties, excellent meat producer
Peking (meat)	chief U.S. commercial breed	yellow skin, orange shanks and feet	reaches market weight in eight weeks
turkey			
Beltsville Small White (meat)	developed in U.S.	white feathers, light orange feet and legs	large proportion of white meat
Broad-Breasted Bronze (meat)	English breed, now in North America	dark brown feathers, white bars on wings	exceptionally well-meated
other			
goose (meat, eggs, and feathers)	domestic breeds raised worldwide	long necks, similar plumage in both sexes	Toulouse, Embden, African varieties
guinea fowl (meat)	raised worldwide	slaty plumage, speckled with white	raised on large scale only in Italy
squab (meat)	raised worldwide	immature pigeons	attain market size in about four weeks

far-reaching influence. He was a man of moral and intellectual strength whose wit and grace were evident throughout his writings.

Fowler was educated at Balliol College, Oxford (B.A. and M.A., 1886) and taught at Sedbergh School until 1899. He lived in London from 1899 to 1903, supporting himself with a small inheritance and the income from essays published in journals. He then moved to Guernsey in the Channel Islands and began his collaboration with his younger brother Francis George Fowler.

The brothers' first work was a four-volume translation, *The Works of Lucian of Samosata* (1905), followed by *The King's English* (1906) and *The Concise Oxford Dictionary of Current English* (1911). Their work was interrupted by military service during World War I; Francis George died of tuberculosis in 1918. After the war H.W. Fowler returned to Guernsey and in 1924 published *The Pocket Oxford Dictionary of Current English*.

Fowler's major work, planned with his brother, was *A Dictionary of Modern English Usage* (1926). It is an alphabetical listing of points of grammar, syntax, style, pronunciation, and punctuation. The depth, style, and humour of the work have made it a classic of English philology. Among Fowler's other writings are a collection of essays, *If Wishes Were Horses* (1929), and a volume of poetry, *Rhymes of Darby to Joan* (1931).

Fowler, John (b. July 11, 1826, Melksham, Wiltshire, Eng.—d. Dec. 4, 1864, Ackworth, Yorkshire), English engineer, who helped to develop the steam-hauled plow. He began his career in the grain trade but later trained as an engineer. In 1850 he joined Albert Fry in Bristol to found a works to produce steam-hauled implements. Later, with Jeremiah Head, he produced a steam-hauled plow, which in winning the £500 prize (1858) offered by the Royal Society fulfilled the society's dictum for a "steam cultivator" that would be an "economic substitute for the plough or the spade."

Fowler, Sir John, 1ST BARONET (b. July 15, 1817, Wadsley, near Sheffield, Yorkshire, Eng.—d. Nov. 20, 1898, Bournemouth, Hampshire), English civil engineer, who helped design and build the underground London Metropolitan Railway and was joint designer of the Forth Bridge in Scotland.

Sir John Fowler, engraving by Thomas Oldham Barlow, 1868, after a portrait by Sir John Everett Millais; in the Science Museum, London

By courtesy of the Science Museum, London

Fowler set up in London in 1844 as a consulting engineer, laying out many small railway systems later incorporated into the Manchester, Sheffield, and Lincolnshire railways. In 1860 he designed the Pimlico Railway Bridge across the River Thames. He worked on most of the extensions of the Metropolitan Railway (the early London Underground), which was the world's first subway system. Its lines were excavated from the surface and permanently covered rather than tunneled. He also designed and built a locomotive known as "Fowler's Ghost," for the railway. Later, he

was an engineer for the deep-tunneling "tube" system extensively adopted for London electric railways. He was also the engineer for the construction of Victoria Station.

After serving as general engineering adviser in Egypt to the khedive Ismā'īl, he became, in 1875, a partner of Benjamin Baker in the design and construction of the great cantilever bridge over the Firth of Forth (1882–90). He was created a baronet in 1890.

Fowler, William A., in full WILLIAM ALFRED FOWLER (b. Aug. 9, 1911, Pittsburgh, Pa., U.S.—d. March 14, 1995, Pasadena, Calif.), American nuclear astrophysicist who, with Subrahmanyan Chandrasekhar, won the Nobel Prize for Physics in 1983 for his role in formulating a widely accepted theory of element generation.

Fowler studied at Ohio State University (B.S., 1933) and at the California Institute of Technology (Ph.D., 1936), where he became a professor in 1939. His theory of element generation, which he developed with Sir Fred Hoyle, Margaret Burbidge, and Geoffrey Burbidge in the 1950s, suggests that in stellar evolution elements are synthesized progressively from light elements to heavy ones, in nuclear reactions that also produce light and heat. With the collapse of more massive stars, the explosive rebound known as supernova occurs; according to theory, this phase makes possible the synthesis of the heaviest elements.

Fowler also worked in radio astronomy, proposing with Hoyle that the cores of radio galaxies are collapsed "superstars" emitting strong radio waves and that quasars are larger versions of these collapsed superstars.

Fowler received the National Medal of Science (1974) and the Legion of Honour (1989).

Fowles, John, in full JOHN ROBERT FOWLES (b. March 31, 1926, Leigh-on-Sea, Essex, Eng.—d. Nov. 5, 2005, Lyme Regis, Dorset), English novelist whose allusive and descriptive works combine psychological probings—chiefly of sex and love—with an interest in social and philosophical issues.

Fowles graduated from the University of Oxford in 1950 and taught in Greece, France, and Britain. His first novel, *The Collector* (1963; filmed 1965), about a shy man who kidnaps a girl and keeps her captive in a hapless search for love, was immediately successful. A Greek island is the setting of his second novel, *The Magus* (1965, rev. ed. 1977; filmed 1968). *The French Lieutenant's Woman* (1969; filmed 1981), arguably Fowles's best-known work, is a love story set in 19th-century England that richly documents the social mores of that time. An example of Fowles's highly original style, the book reinvented the Victorian novel by including such postmodern elements as alternate endings. His later novels include *Daniel Martin* (1977), *Mantissa* (1982), and *A Maggot* (1985). He also wrote poetry and the text for several photographic studies, *Wormholes*, a collection of essays and writings, was published in 1998.

Fox, an Algonquian-speaking tribe of North American Indians who called themselves Meshkwakihug, or Mesquakie (Red-Earth People). When they first met Europeans in 1667, they lived in the forest zone of what is now northeastern Wisconsin.

Their permanent villages—near fields in which women cultivated corn (maize), beans, and squash—were occupied in summer; most Fox left the villages after the harvest to participate in communal winter bison hunts on the prairies. A peace chief and council of elders administered tribal affairs; important issues were discussed by the entire tribe until decisions were reached. War parties rallied about men whose skill and reputation made them leaders. Families were grouped into clans that were mainly ceremonial organizations with members tracing their descent from a myth-

ical founder through the male line. A major religious organization was the Midewiwin, or Grand Medicine Society, a secret society whose members were believed to be able to heal the sick and to enlist supernatural aid to ensure tribal welfare. Many ceremonies involved the use of sacred medicine bundles, which were collections of magical objects.

"Fox Warrior," painting by Henry Inman, 1832, from an original by an unknown artist; in the Peabody Museum of American Archeology and Ethnology, Harvard University

By courtesy of Peabody Museum, Harvard University, Cambridge, Mass.

Beginning about the 18th century the Fox joined with the Sauk (Sac) to war against the French and then the English and, though unconquered, retreated to Illinois and then Iowa. They moved to Kansas in 1842, but in 1857 they returned to Iowa, where they purchased land in Tama county and where they reside today. The Fox have maintained their traditional community; clan and ceremonial organizations survive, and the Fox language is spoken in the home. They hold their land as a tribe, with an elected business council to handle funds and relations with the government.

fox, any of various members of the dog family (Canidae) resembling small to medium-sized, bushy-tailed dogs with long fur, pointed ears, relatively short legs, and narrow snouts. In a more restricted sense, the name refers to about 10 species of true foxes (*Vulpes*), especially the red, or common, foxes, *V. vulpes* of the Old World and *V. fulva* (included with *V. vulpes* by some authorities) of the New World.

Red foxes are widely held symbols of animal cunning and are the subject of a considerable amount of folklore. The native Old World form ranges over virtually all of Europe, temperate Asia, and northern Africa; the New World red fox inhabits most of North

Red fox (*Vulpes vulpes*)

Karl H. Maslowski

America north of Mexico. Red foxes, with their coats of long guard hairs and soft, fine underfur, are typically a rich reddish brown with white-tipped tail and black ears and legs. Colour, however, is variable; the colour phases known as black and silver fox are found in North America, and the cross, or brant, fox is found in both North America and the Old World. Red foxes are generally about 90–105 centimetres (36–42 inches) long (about 35–40 cm of this being tail), stand about 40 cm at the shoulder, and weigh about 7 kilograms (15 pounds). Their preferred habitat is mixed farmlands and woodlots. Small mammals, chiefly mice and rabbits, as well as eggs, fruit, and birds (including some domestic fowl) comprise the diet; remains of larger animals usually indicate that the fox fed on carrion. Red foxes mate in winter; after a gestation period of about 51 days, one to ten helpless cubs are born in a den, which is commonly a burrow abandoned by another animal and enlarged by the parent foxes. The cubs remain in the den for about five weeks and are cared for by both parents throughout the summer.

Red foxes are hunted by man, one of their few enemies, for sport and fur. Fox pelts, especially those of silver foxes, are commonly produced commercially on fox farms. Wild red foxes, although they are often destroyed for raiding hen houses, are highly beneficial in controlling undesirable rodents.

The other members of the genus *Vulpes* and the varieties of red foxes include the following: African sand fox; pale fox (see below).

Bengal fox (*V. bengalensis*), small gray fox common in southern Asia.

Black fox, colour phase of the red fox; sometimes also used as a common name for the fisher (*a.v.*).

Blanford's fox: hoary fox (see below).

Brant fox: cross fox (see below).

Chama (caama, cama, kama) fox: South African silver fox (see below).

Corsac (corsak) fox (*V. corsac*), small, steppe-dwelling fox of eastern Eurasia; coat yellowish brown or reddish brown.

Cross fox, yellowish brown colour phase of the red fox, having a cross-shaped black marking extending across the shoulders and down the back.

Hoary fox (*V. cana*), Eurasian species about 60 cm in length; coat gray above, white below.

Indian fox: Bengal fox (see above).

Kit fox (*V. macrotis*) and swift or plains kit fox (*V. velox*), large-eared pale foxes of western North American plains and deserts; possibly not separable as two distinct species; colour gray to yellowish brown with black-tipped tail; adult length about 40–50 cm without the 20–30-cm tail, weight about 1.5–3 kg; *V. macrotis*, smaller with larger ears; both forms live in burrows, feed on small animals (rodents, rabbits, insects); shy, uncommon, beneficial in rodent control.

Pale fox (*V. pallida*), yellow to brown desert fox of northern Africa.

Ruppell's fox (*V. ruppelli*), big-eared gray desert fox of northern Africa and southwestern Asia; sometimes also called fennec; length to 74 cm.

Samson fox, genetic mutant strain of red fox found in northwestern Europe; guard hairs lacking, underfur tightly curled.

Sand fox: Ruppell's fox (see above).

Silver fox, colour phase of the red fox having a variable amount of white or white-banded hairs in the black coat.

South African silver fox (*V. chama*), long-eared, gray-coated species of southern Africa, found particularly in the Kalahari Desert region; sometimes called fennec; length usually less than 60 cm.

Steppe fox: corsac fox (see above).

Swift fox: kit fox (see above).

Tibetan sand fox (*V. ferrilata*), short-eared, short-tailed central Asian fox with a yellowish coat.

For information about other foxes, see Arctic fox (includes blue fox); bat-eared fox; crab-eating fox; fennec; gray fox; South American fox.

Fox, Charles James (b. Jan. 24, 1749, London—d. Sept. 13, 1806, Chiswick, Devon, Eng.), Britain's first foreign secretary (1782, 1783, 1806), a famous champion of liberty, whose career, on the face of it, was nevertheless one of almost unrelieved failure. He

Charles James Fox, detail of an oil painting attributed to John Zoffany; in the Henry E. Huntington Library and Art Gallery, San Marino, Calif.

conducted against King George III a long and brilliant vendetta; for this reason he was almost always in political opposition and, in fact, held high office for less than a year altogether. He achieved only two important reforms, steering through Parliament a resolution pledging it to abolish the slave trade speedily and, in the 1792 Libel Act, restoring to juries their right to decide not merely whether an allegedly libellous article had, in fact, been published but also what constituted libel in any given case and whether or not a defendant was guilty of it.

Early life. Fox was the third son of Henry Fox, afterward 1st Baron Holland, by his wife, Lady Caroline Lennox, daughter of the 2nd duke of Richmond. Through his mother he was descended from Charles II of England and Henry IV of France. He was educated at Eton and at Hertford College, Oxford, where he acquired an extensive knowledge of the classics, to which he remained devoted for the rest of his life. His father brought him up without the least regard for morality and encouraged him, while still a schoolboy, to acquire extravagant and dissolute habits. He lost vast sums at gambling, and in 1774 his father, just before his death, paid the young man's gambling debts to the amount of £140,000. Almost 20 years later political friends not only freed him from debt but settled on him a comfortable income. He then showed his gratitude by abandoning forever both racing and gambling.

Entry into politics. Fox was procured a seat in Parliament by his father in 1768. Two years later he was appointed a junior lord of the Admiralty but gave up his office in February 1772 in order that he might be free to oppose a bill (eventually the Royal Marriage Act) designed to prevent marriages of members of the royal family unless authorized by the king or ratified by the Privy Council. He reentered the government the following December as a junior lord of the Treasury, but the King, who already disliked him for his recent opposition, accused him of insubordination and dismissed him in February 1774.

Already a friend of Edmund Burke, he naturally gravitated into the Whig group and before long was their accepted leader in the Commons. He went into opposition just when the controversy with the American colonies was

becoming acute. Believing that the colonial policy of the prime minister Lord North was unjust and oppressive, he opposed it with unrestrained violence, but he later admitted that the American war was popular in England. The series of disasters sustained by the British troops in America, culminating in the capitulation of the army led by Lord Cornwallis at Yorktown (October 1781), eventually brought down North's government (March 1782). The King had to call in a Whig ministry, of which Lord Rockingham became prime minister, and Lord Shelburne (later marquess of Lansdowne) colonial secretary; Fox became the first foreign secretary in English history.

Fox believed, erroneously, that the negotiations for peace with the Americans came within the province of the foreign secretary, and he wished to recognize the independence of the former colonies immediately and unconditionally. Shelburne wanted to withhold this recognition until the peace treaties with the European countries with which Britain had also been at war were ready for signature; and he maintained that, since the independence of America had not yet been formally recognized, he, as colonial secretary, had the right to conduct the negotiations. Fox, therefore, notified his intention to resign (June 30), but before he could implement it Rockingham died (July 1).

When the King offered the premiership to Shelburne, Fox and his friends maintained that it was for them, not for the King, to choose Rockingham's successor. This was unconstitutional; the King had the undoubted right to choose the minister. Fox and some of his friends at once resigned, but others remained to support Shelburne. The historian Sir George Otto Trevelyan described Fox's refusal to serve under Shelburne as the fatal and irreparable mistake of his life. Though his suspicions of Shelburne were far from groundless, they were exaggerated; moreover, Shelburne was in some respects the most enlightened statesman of his time.

The Fox-North coalition (1783). Fox always had a liking for coalitions; on Feb. 14, 1783, he joined with his old enemy North to eject the new government and accomplished his object 10 days later. Defending an action that was undoubtedly unpopular and damaging to his reputation, Fox maintained that it was wise and candid to end the hostility between North and himself now that its sole cause, the American war, was over.

After trying desperately for five weeks to withstand "the most unprincipled coalition the annals of this or any other nation can equal," the King had to grant it office (April 2). The Duke of Portland, a nonentity, became the nominal prime minister; Fox and North, the two secretaries of state. Although the King withheld from the ministers various customary marks of royal confidence, they had no difficulty in retaining the vote of the independent country gentlemen in the House of Commons. The new ministers did not improve their position at court by proposing to give the Prince of Wales (later George IV) an income of £100,000 a year. By remaining the intimate friend of this dissolute young man, who was detested by his father and who ostentatiously supported the coalition, Fox further outraged the King's feelings.

The coalition fell because of its India bill. Fox and North had no wish to evade their responsibility for ending a system of misgovernment in India that had alarmed and disquieted English statesmen of all parties. Their bill proposed to change the whole constitution of the East India Company, which effectively controlled British India, by transferring control of the company's territories, revenues, and commerce to seven commissioners who were to be nominated by the British government and removable only upon a vote of either house of Parliament. But vested interests took

alarm, and the House of Lords rejected the bill on December 17 after the King had made it known that he would consider as an enemy anyone who voted for it. The coalition was dismissed next day, and the young politician William Pitt (the Younger) accepted an invitation to form a government.

Fox increased his unpopularity by attacking the sovereign's right to choose his ministers and to appeal to the electorate to confirm his choice. Fox's opponents could now plausibly maintain that he would not even submit his case to the judgment of the nation. Many of the coalitions's supporters changed sides, and the dissolution of Parliament (March 1784) completed the discomfiture of the opposition, which found itself with only about 145 members in the new House of Commons. Fox himself, however, was reelected for the great popular constituency of Westminster, defeating the ministerial candidate.

Opposition to Pitt and Addington. Had he been even a little accommodating, Fox could have joined William Pitt's government on honourable terms in 1784, to the great advantage of the cause of reform. But his attacks on Pitt's proposed commercial concessions to Ireland in 1785 and on a commercial treaty made with France in 1787 damaged his reputation. He blundered again in 1788–89, when the King was temporarily insane, by supporting the claim of the Prince of Wales to the regency as a right—whereas Pitt maintained that Parliament alone had the right and competence to appoint a regent. Party interests, of course, were deeply involved in the constitutional dispute; the Prince's first act of power would have been to dismiss Pitt and bring in the Whigs.

Fox welcomed the outbreak of the French Revolution in 1789. War with Revolutionary France broke out in 1793, and a large part of the opposition, headed by Portland, went over to the government in 1794. The minority (50–60) adhering to Fox became one of the weakest oppositions ever known in England, and in about 1797 many opposition members even ceased to attend Parliament. Fox was dismissed from the Privy Council in 1798 for reaffirming in a public speech the doctrine of the sovereignty of the people; yet eight years later the King had to reinstate him without exacting any retraction of principle.

In 1795 Fox had secretly married Elizabeth Armitstead, with whom he had been living for many years and to whom he always remained devoted; the marriage was revealed only in 1802. In their country house, St. Anne's Hill, near Chertsey in Surrey, he indulged his tastes for classical literature and a rural existence and found there ample compensation for all the disappointments and stresses of public life. Mrs. Fox, who bore him no children, died on July 8, 1842.

Fox approved of the peace negotiations that resulted in the treaty signed at Amiens (1802) but spoke of the "shameful surrender of all our conquests" to Napoleon. He was critical of the ministry (1801–04) of Henry Addington (afterward Viscount Sidmouth) for its failure either to preserve the peace or to put the country into an adequate state of defense to meet Napoleon's invasion threat, which followed the renewal of war in 1803. Though his motion, virtually one of censure (April 23, 1804), was defeated by 256 votes to 204, Addington's government resigned a few days later.

Pitt now wished to form a coalition government on a broad base but failed to persuade George III to waive his objections to Fox as a minister (he would have been foreign secretary), though the King was prepared to give him a foreign mission. Fox, with his usual generosity, acquiesced in this proscription, said that he was too old (at 55) to care about office, and advised his friends to join the coalition; but both they and the follow-

ers of Lord Grenville (with whom they had recently collaborated) rejected the suggestion and went into opposition.

Last years. When Grenville became prime minister after Pitt's death on Jan. 23, 1806, the King's veto on Fox's appointment to office as foreign secretary disappeared without protest. During the earlier phase of the war against France, Fox had believed that the various European despots were fighting to destroy the newly won liberties of the French, and he had underestimated the bellicose spirit of France and the danger to England of French conquests. But by 1806 he had come to realize that France, under Napoleon, threatened Great Britain and the whole Continent.

By this time Fox's health was breaking down. Suggestions were made that he should take some less laborious office, or even that he should take a peerage to save him from the more exacting task of leading the House of Commons. Fox made his last speech in Parliament on June 19, 1806, and he died on September 13 in the Duke of Devonshire's house. He was buried in Westminster Abbey by the side of Pitt.

Assessment. Fox had a genius for friendship, and the secret of his political influence was the uncalculating generosity of his mind. His charm could overcome the hostility of even the most inveterate of his foes. As a statesman he had great and manifest failings. He was often governed by prejudice, and he was not a profound political thinker. Above all, he hated anything that savoured of oppression, and his attitude on various colonial issues showed his passionate determination that the peoples of the empire were no longer to be exploited. His approval of the French Revolution shattered his friendship with the statesman and political writer Edmund Burke; although privately Fox showed himself far from insensible to the horrors perpetrated by the French Republicans, he gave these feelings no adequate public expression and opposed the war with republican France as a crusade against freedom in the interests of despotism. At home the excessive power of the crown was, in his view, the great source of all the country's ills, and to the destruction of that overweening power he dedicated his life. He put forward the view, afterward accepted, that the crown must choose the prime minister from the party that commanded a majority in the House of Commons, irrespective of the sovereign's personal inclinations. Yet he was no democrat, despising public opinion if he considered it prejudiced and intolerant. He would never have countenanced the notion that property, the security of which was one of the prime preoccupations of both Whig and Tory parties, would be safe in a democratic society in which the propertyless voters would obviously be in a majority. In his view property was the true foundation of aristocracy, and a country best prospered whose government was in such hands.

Fox had a strong European sense and a deep feeling for the responsibilities of his own country as a member of a greater society with mutual obligations. It was because he held these large and generous views that his influence endured, inspiring such measures as the Reform Act of 1832. (A.As.)

BIBLIOGRAPHY. For the general reader two good modern surveys of the period covered by Fox's political career are John Steven Watson, *The Reign of George III, 1760–1815* (1960); and Leslie George Mitchell, *Charles James Fox and the Disintegration of the Whig Party, 1782–1794* (1971). Ian Christie, *The End of North's Ministry, 1780–82* (1958), is most useful, as also are Richard Pares, *King George III and the Politicians* (1953); and D.G. Barnes, *George III and William Pitt, 1783–1806* (1939, reprinted 1965). A biography critical of Fox is John W. Derry, *Charles James Fox* (1972). Older books that can still be read with profit are Sir George Otto Trevelyan, *The Early*

History of Charles James Fox, new ed. (1908); and *his American Revolution*, new ed., 6 vol. (1905–16, reprinted 1964). Students who wish to consult the manuscript sources for Fox's career should turn first to the *Memorials and Correspondence of Charles James Fox*, ed. (though not very accurately) by Lord John Russell, 2 vol. (1853). A great deal of new correspondence and material bearing on Fox's career is in *The Later Correspondence of George III*, 5 vol. (1962–70), and *The Correspondence of George, Prince of Wales, 1770–1812*, 8 vol. (1963–71), both series edited by Arthur Aspinall.

Fox, George (b. July 1624, Drayton-in-the-Clay, Leicestershire, Eng.—d. Jan. 13, 1691, London), English preacher and missionary and founder of the Society of Friends (or Quakers); his personal religious experience made him hostile to church conventions and established his reliance on what he saw as inward light or God-given inspiration over scriptural authority or creeds. He recorded the birth of the Quaker movement in his *Journal*.

Early life and activities. Fox was the son of a weaver in the English village of Drayton-in-the-Clay (now Fenny Drayton), Leicestershire. Probably apprenticed for a while to a cobbler, he may also have tended sheep, but there is little evidence of any adult business occupation or of much formal education. He always seemed to have a modest amount of money. He read extensively and wrote legibly. At the age of 18 he left home in search of satisfying religious counsel or experience and later reported in his *Journal* various personal religious experiences or direct revelations, which he called "openings," that corrected, in his estimation, the traditional concepts of faith and practice in English religious life.

His religious background was apparently Puritan rather than strict Anglican, but he himself reacted even further than the Puritans from the formalism and traditionalism of the established church. He placed the God-given inward light (inspiration) above creeds and scripture and regarded personal experience as the true source of authority. In his *Journal* he wrote,

These things I did not see by the help of man, nor by the letter, though they are written in the letter, but I saw them in the light of the Lord Jesus Christ, and by his immediate Spirit and powers, as did the holy men of God, by whom the Holy Scriptures were written.

His negative attitude to ecclesiastical customs was matched by a similar attitude toward some political and economic conventions (e.g., oaths, titles, and military service).

He began preaching to individuals or groups as he travelled on foot, first in the Midland counties of England, then in the northern counties, where groups of Seekers (a 17th-century Puritan sect) welcomed him and his message. Local congregations were established, gathered both by Fox and by many other itinerant men and women preachers, who were called Publishers of Truth. Thus came into being in the last years of the British Commonwealth (1649–60) the Society of Friends, as it was much later called, though its members were early nicknamed Quakers.

Fox had most success in winning adherents and fellow workers in the Lake District counties of Westmorland and Lancashire and later in Yorkshire, London, and other areas. He and his associates suffered public hostility and official constraint. They offended religious leaders both religiously and politically by their contradiction of the ministers in the churches (based on Fox's view that ministers "bred at Oxford or Cambridge" were not qualified to be spiritual leaders in the churches) and by their refusal to honour officials, to take oaths, or to pay tithes. Fox and his associates were often arrested and imprisoned. Fox, in fact,

suffered eight imprisonments between 1649 and 1673.

The restoration of the monarchy in 1660 led to special legislation against the Quakers and a widespread action against them. To meet this and other needs, George Fox encouraged local Quaker groups to organize into regular monthly and quarterly business meetings, which, with some central national meetings, became a permanent pattern of their church government. The continuing pressure was only intermittently relieved until the Toleration Act of 1689, shortly before Fox's death, gave relief to the Quakers.

Missionary work in England and elsewhere. In 1669 Fox made a missionary visit to Ireland, and on his return he married one of his early converts, Margaret Fell, the widow of Judge Thomas Fell of Swarthmore Hall, Ulverston, Lancashire, where Fox spent parts of the following years. In the years 1671 to 1673 he traveled to the British colonies in the Caribbean and the North American mainland, strengthening and organizing the existing Quaker communities, especially in Maryland and Rhode Island. Shorter journeys in 1677 and 1684 took him to The Netherlands and a few other parts of northern Europe. About 1675 he dictated a running summary of his life that, with supplementary material, was posthumously edited and published as his *Journal*. For most of the last 15 years of his life he lived as a boarder or visitor in or about London, attending consultations and committees on practical questions, preaching at meetings for worship, and engaging in a wide correspondence with individual Friends or with congregations to whom he was known.

Throughout his life, Fox shared the contemporary practice of writing controversial pamphlets, scores of which were published. They dealt with social as well as theological questions but lacked stylistic attraction. Although he was quite familiar with the English Bible, he sometimes displayed a taste for subjects like history and grammar, in which he had little competence. He borrowed information occasionally from his learned friends.

Fox evidently was, as Thomas Carlyle says, a man of enormous self-confidence, one who attracted rather than repelled. A magnetic personality, he was widely respected and admired by such men as William Penn, who left in writing an appreciation of Fox that is still the best summary of his character. Fox's own *Journal* is naturally not entirely objective, but with its many details it forms the fullest account of the rise of Quakerism, as well as of Fox himself. It is partly due to Fox's own sense of the historic importance of the Quaker movement that much other early written material was recorded and preserved. (H.J.C.)

Fox, William, original name WILHELM FRIED (b. Jan. 1, 1879, Tulchva, Hung.—d. May 8, 1952, New York, N.Y., U.S.), American motion-picture executive, who built a multimillion-dollar empire controlling a large portion of the exhibition, distribution, and production of film facilities during the era of silent film.

Fox worked as a newsboy and in the fur and

garment industry before investing in a Brooklyn nickelodeon. By 1913 he was one of the most powerful of the independent exhibitors and distributors and led their successful antitrust fight against the Motion Picture Patents Company. In 1915 the Fox Film Corporation, the progenitor of the Twentieth Century-Fox studios, was formed. Fox introduced organ accompaniment to the silent films shown in his theatres and pioneered in designing theatres for the comfort of the patrons. Through an adroit use of publicity, he developed Theda Bara into the first screen vamp and a star. He was also famous for the 1927 news series *Movietone News*, the first commercially successful sound film.

Because of the expense of converting 1,100 theatres to sound equipment and the Great Depression, Fox's empire crumbled. He declared bankruptcy in 1936 and in 1942 served a term in prison for obstructing justice.

Fox, Sir William (b. Jan. 20, 1812, South Shields, Durham, Eng.—d. June 23, 1893, Auckland, N.Z.), author and statesman, who helped shape the Constitution Act of 1852, which established home rule for New Zealand. He also served as the nation's prime minister (1856, 1861–62, 1869–72, 1873).

After emigrating to New Zealand in 1842, Fox became an agent for the New Zealand Company the following year and its principal agent in 1848. His lobbying in England (1851–52) was probably responsible for the addition of Taranaki to the five original provinces in the Constitution of 1852, which granted self-government. His account of the events leading up to the constitution, *The Six Colonies of New Zealand*, was published in 1851.

Fox reentered politics in 1861, concerned about the first Taranaki War (1860–61) between settlers and the native Maori. As colonial secretary and minister of native affairs (1863–64), he advocated a vigorous war effort against the Maoris and confiscation of their land, policies that brought him into conflict with the governor, Sir George Grey. He defended his government's actions in *The War in New Zealand* (1860; rev. ed., 1866). Although he acted as premier (1869–72), the colonial treasurer, Julius Vogel, held the real power. In his parliamentary career, Fox was most effective as head of the opposition rather than in leading the government. He resigned his seat in Parliament in 1875 and was knighted in 1879.

Fox, Vicente, in full VICENTE FOX QUESADA (b. July 2, 1942, Mexico City, Mex.), Mexican president from 2000. His term in office marked the end of 71 years of uninterrupted rule by the Institutional Revolutionary Party (PRI).

Fox, the second of nine children, was born to parents of Spanish and Irish descent and raised on a 1,100-acre (445-hectare) ranch in the state of Guanajuato. After earning a degree in business administration from the Ibero-American University in Mexico City, he took courses at the Harvard Business School. Fox later became a salesman for the Mexican unit of the Coca-Cola Company, and, after a series of promotions, he served as the company's chief executive in Mexico (1975–79). As a candidate for the National Action Party (PAN), Fox was elected to the national Chamber of Deputies in 1988. In 1991 he lost a controversial gubernatorial election in Guanajuato, but he was elected governor there in 1995. Fox succeeded former president Ernesto Zedillo (*q.v.*) on Dec. 1, 2000, after leading PAN to electoral victory over the PRI. He subsequently announced plans to improve trade relations with the United States and calm civil unrest in the such areas as Chiapas and Tabasco.

fox bat, also called FLYING FOX, any of numerous tropical Old World bats belonging to the family Pteropodidae (*q.v.*).

Fox Broadcasting Company, American television broadcasting company founded in 1986 by the media magnate Rupert Murdoch. It is a subsidiary of Fox, Inc., and it is headquartered in Beverly Hills, Calif.

With the considerable financial backing of Murdoch, the network began with 79 affiliate stations that reached 80 percent of homes in the United States. Its first broadcast, a late-night talk show hosted by comedienne Joan Rivers, aired on Oct. 9, 1986. The following March the network expanded into prime-time programming on Saturday and Sunday nights. Over the next seven years, the company increased broadcast hours until the network was on the air seven nights a week and gained more affiliates, making it available across the nation. The most popular Fox programs included the fact-based *America's Most Wanted* and *Cops*; the animated cartoon *The Simpsons*; the comedy *Married...with Children*; and the drama *Melrose Place*. It added programming divisions for children and sports in the 1990s.

Fox Film Corporation: see 20th Century-Fox Film Corporation.

fox hunting, chase of the fox by horsemen with a pack of hounds. In England, the home of the sport, fox hunting dates from at least the 15th century. In its inception, it was probably an adjunct to stag and hare hunting, with the same hounds used to chase each quarry.

Modern fox hunting took shape in the 19th century shortly after Hugo Meynell—the father of the modern English chase—started hunting; and it soon developed into a national upper-class pastime. Traditional procedure is still observed. A fox hunt is conducted by a field master, who may be one of various joint masters of the hunt. The hounds, generally 15 to 20 couples (matched pairs), are controlled by the huntsman, who is generally the senior paid servant of the hunt. Two or three whippers-in assist in reconnaissance and in keeping the hounds together as a pack. Master, huntsman, and whippers-in take precedence over all other riders to hounds. The huntsman controls hounds by voice, his calls being known as cheers, and by his horn—a copper tube about eight inches long that produces two penetrating notes. The entourage of a hunt usually also includes grooms; second horsemen, who ride relief horses for the master, his staff, and leading followers; and earth stoppers, who close up all earths, or fox dens.

A day's hunting begins with a meet, at which the followers join the hounds, acknowledge the master, and are frequently offered hospitality by one of their number who acts as host for the occasion. On the command of the master, hounds move off to draw (search) the covert, which may be woodland, a patch of gorse, or a field in which it is suspected that a fox may be. When the fox is found, the fact being signaled by the cry of hounds, notes of the horn, and the shout "Tally-ho," the hunt begins and ordinarily proceeds to the stage at which the fox is viewed, a moment signaled by a high-pitched "Holloa." Foxes that go to ground (*i.e.*, into holes or dens) are dug out by terriermen or other assistants. If a kill follows, the brush (tail), mask (head), and pads (feet) of the fox may be given as trophies by the master to any followers whom he considers to deserve the honour. The body of the fox is then thrown to the hounds.

Fox-hunting uniform is usually a scarlet coat with white stock (cravat) and black velvet cap for the master, huntsman, and whippers-in. Followers of sufficient prestige are invited to wear scarlet, with the individual buttons of the hunt, and top hat (the velvet cap being strictly the prerogative of those actively engaged in the control of hounds, though by modern usage women also wear it). Other followers wear black coats, with top hats or bowlers. In the case of some ancestral hunts run by noble

A fox hunt, with the huntsman (foreground) and his hounds, Scotland

families," the uniform may be green, yellow, or gray instead of scarlet.

Before World War I, fox hunting reached a zenith of popularity as an English field sport, and horse and hound breeding also arrived at a highly developed state. The sport faced a number of difficulties in the 20th century, notably the subdivision of large landholdings, limiting the availability of hunting grounds, and opposition to fox hunting on anticruelty and other grounds. Hunting continued, however, in England, Wales, Ireland, and parts of Scotland from November, when the harvest was gathered, until April, when new crops began to grow. The sport was also practiced in similar season in the United States, Canada, New Zealand, and Australia. In the early 21st century, however, efforts to end the sport intensified, and in 2002 Scotland banned fox hunting. In 2004 the British House of Commons outlawed hound-led hunts in England and Wales, and, despite legal challenges, the ban went into effect in 2005.

Foxhunting continues in many countries but often with slightly different traditions. In the United States, for example, the goal of hound-led hunts is typically not to kill the quarry. Moreover, because of a shortage of foxes in some areas, coyotes are often hunted instead.

fox shark, species of thrasher shark (*q.v.*).

fox terrier, well-known breed of dog developed in England to drive foxes from their dens. The two varieties of fox terrier, wire-haired and smooth-haired, are structurally

Wire-haired fox terrier

Sally Anne Thompson

similar but differ in coat texture and in ancestry. The wire-haired variety was developed from a rough-coated black-and-tan terrier, the smooth from the beagle, greyhound, bull terrier, and a smooth-coated black-and-tan terrier. At one point, the two varieties were crossed, but this practice was discontinued. Both varieties are sturdily built, lively looking dogs with tapered muzzles and folded, V-shaped ears. They stand about 38 cm (15 inches) and weigh 7 to 8 kg (16 to 18 pounds). Predominantly white with black or black-and-tan markings, fox terriers are noted for having bold, energetic, and spirited natures.

fox-trot, ballroom dance popular in Europe and America since its introduction around 1914. Allegedly named for the comedian Harry Fox, whose 1913 Ziegfeld Follies act included a trotting step, the fox-trot developed less strenuous walking steps for its ballroom version. The music, influenced by ragtime, is in $\frac{4}{4}$ time with syncopated rhythm. The speed of the step varies with the music: half notes (minims) require slow steps; and quarter notes (crotchets), fast steps.

The fox-trot consists primarily of walking steps, *chassés* (step side, close step), and quarter turns. Couples usually hold each other in the traditional ballroom position, but numerous variations are done in other positions. Fox-trots for fast music include the one-step (one walking step to each musical beat) popularized by Irene and Vernon Castle and the peabody (with a quick leg cross).

Foxe, John (b. 1516, Boston, Lincolnshire, Eng.—d. April 18, 1587, Cripplegate, London), English Puritan preacher and author of *The Book of Martyrs*, a graphic and polemic account of those who suffered for the cause of Protestantism. Widely read, often the most valued book beside the Bible in the households of English Puritans, it helped shape popular opinion about Roman Catholicism for at least a century. Antagonism for Spain, important in the politics of the age, was fanned by the book's description of the Inquisition. It dealt chiefly, however, with the martyrdom of English Protestants from the 14th century through the reign of Queen Mary I in Foxe's own time.

After studying at the University of Oxford and holding a fellowship for seven years, Foxe fell under suspicion of harbouring Protestant views more extreme than the authorities of his college would allow. He resigned and in 1547 moved to London, where he became tutor to the grandchildren of the duke of Norfolk. He was ordained a deacon of the Church of England. Foxe worked for the Reformation, writing several tracts. He also began his account of martyrs but had carried it no further than 1500 when the accession of the Roman Catholic queen Mary I in 1553 forced him to flee overseas. In Strasbourg, France, he published his partly completed martyrology in Latin as *Commentarii rerum in ecclesia gestarum* (1554; "Commentaries on Affairs Within the Church"). He then went to Frankfurt, where he lent a moderating support to the Calvinistic party of John Knox, and thence to Basel, Switz., where he wrote a burning appeal to the English nobility to restrain the queen from persecuting Protestants: *Ad inelytos ac praepotentes Angliae proceres*; ("To the Renowned and powerful Nobles of England," 1557). With the aid of manuscripts sent to him from England, he carried his account of the martyrs up to 1556 and had it printed in 1559, the year following the accession to the throne of the Protestant queen, Elizabeth I.

Foxe returned to London and devoted himself to the completion of his great work. Perusing official registers and using the memories of eyewitnesses, he enlarged his story. His English translation was printed in March 1563 under the title *Actes and monuments of these latter and perillous dayes*. It immediately acquired the popular name, *The Book of Martyrs*. In 1570 he produced his greatly improved second edition. This was the crown of his achievement; he made few changes in his third (1576) and fourth (1583) editions.

Foxe was ordained an Anglican priest in 1560, but having Puritan scruples he refused all offices, obtaining two church stipends that required no duties. He often preached, however, and a sermon delivered at Paul's Cross (*A Sermon, Of Christ Crucified* [1570]) had a wide sale. In the plague of 1563 he ministered to the victims and wrote a moving tract of consolation. When Anabaptists in 1575 and Jesuits in 1581 were condemned to death,

Foxe wrote vehement letters to Queen Elizabeth and her counselors, begging reprieves.

Foxe's monument is his book. It has been criticized as prolix, carelessly edited, one-sided, sometimes credulous, but it is factually detailed and preserves rare firsthand material on the English Reformation.

Foxe, Richard, Foxe also spelled FOX (b. c. 1448, Ropsley, Lincolnshire, Eng.—d. Oct. 5, 1528, Wolvesley, Hampshire), English ecclesiastical statesman, one of the chief ministers of King Henry VII (ruled 1485–1509) and founder of Corpus Christi College, Oxford (1515–16).

After receiving ordination into the priesthood, Foxe became secretary in Paris to Henry Tudor, earl of Richmond, an exiled claimant to the throne. On Richmond's accession as

Bishop Richard Foxe, detail of an oil on panel painting by Johannes Corvus, c. 1522; in the collection of Corpus Christi College, Oxford

By courtesy of the President and Fellows of Corpus Christi College, Oxford, photograph, M.R. Dudley

King Henry VII, Foxe was made principal secretary of state and lord privy seal. He later became bishop of Exeter (1487–91), Bath and Wells (1491–94), Durham (1494–1501), and Winchester (1501–28).

Nevertheless, he neglected his ecclesiastical duties to concentrate on diplomacy. He negotiated the treaties and directed the diplomatic maneuvers that minimized the aid given by the Scots, the French, and the Dutch to rival claimants to Henry's throne. In addition, he helped formulate and execute Henry's ruthlessly efficient financial policies.

After Henry VII's death in 1509 Foxe for a time remained in favour with the new ruler, Henry VIII. By 1511 he was, however, losing influence to Thomas Wolsey, who became Henry's chief minister. Foxe resigned in 1516 and—by then nearly blind—spent the last years of his life administering his diocese.

foxglove, any of 20 to 30 species of herbaceous plants of the genus *Digitalis* (family

Foxglove (*Digitalis*)

Derek Fell

Scrophulariaceae, *q.v.*), especially *D. purpurea*, the common, or purple, foxglove, which is cultivated commercially as the source of the heart-stimulating drug digitalis. Foxgloves are native to Europe, the Mediterranean region, and the Canary Islands, and they typically grow to a height of 45 to 150 centimetres (18 to 60 inches).

The plants produce alternating, ovate to oblong leaves toward the lower part of the stem, which is capped by a tall, one-sided cluster of pendulous, bell-shaped flowers, each of which may be up to 6½ centimetres (2½ inches) long. The flowers may be purple, yellow, or white and are often marked with spots within.

foxhound, either of two breeds of dogs, one English and one American, that are traditionally kept in packs for the centuries-old ride to hounds of fox-hunting sportsmen. The English foxhound is the product of long, careful breeding. It stands 21 to 25 inches (53 to 64

Foxhound

Sally Anne Thompson—EB Inc

centimetres) and weighs 60 to 70 pounds (27 to 32 kilograms). It has a short coat, which is usually a combination of black, tan, and white.

The American foxhound resembles the English in appearance and size but is more lightly built. It is the oldest breed of sporting dog in the United States and was developed from English foxhounds imported in 1650 and in later years. Various regional strains are found in the United States and are named after their developers; these include the Trigg, Walker, July, and Birdsong hounds. Both breeds of foxhounds have been bred to be strong, swift, and versatile dogs; they are seldom kept as house pets.

foxtail, any of the weedy grasses in the genera *Alopecurus* and *Setaria* of the family Poaceae. There are about 25 species of *Alopecurus*, distributed throughout the North Temperate Zone. Most species are perennial weeds, with dense, cylindrical, often brushlike, flower clusters that resemble foxes' tails. Meadow foxtail (*A. pratensis*), which is native to Eurasia, is used as a forage grass in northern North America; it stands 30 to 80 centimetres (about 12 to 30 inches) high and has a light-green flower cluster 7 cm long.

The genus *Setaria* (formerly called bristle grass) includes nearly 125 species of annual and perennial grasses, mostly of tropical Africa but found in warm areas of all the continents. The plants are taller than those of *Alopecurus*, with bristly flower clusters and flat, thin leaf blades. More than 40 species are found in North America. A few are forage grasses, as

(Top) meadow foxtail (*Alopecurus pratensis*); (bottom) foxtail millet (*Setaria italica*)

plains foxtail (*S. macrostachya*). Foxtail millet (*S. italica*; see millet) is the only economically valuable species. Yellow foxtail (*S. lutescens* or *S. glauca*) and green foxtail (*S. viridis*), named for the colour of their bristles, are common in cornfields and disturbed areas. Bristly foxtail (*S. verticillata*), whose barbed bristles stick to animals and clothing, is also found in those places: the flower clusters from different plants may stick together, forming dense tangles. The name giant foxtail is applied to two weedy annuals: *S. faberi* and *S. magna*.

Foxx, Jimmie, byname of JAMES EMORY FOXX (b. Oct. 22, 1907, Sudlersville, Md., U.S.—d. July 21, 1967, Miami), U.S. professional baseball player, the second man in major league history to hit 500 home runs. (Babe Ruth was the first.) A right-handed hitter who played mostly at first base, Foxx appeared in his first major league game in 1925 and his last in 1945. He hit his first home run in 1927, reached the 500 mark in 1940, and finished with a total of 534 home runs. His career batting average was .325.

Foxx played for the Philadelphia Athletics of the American League from 1925 through 1935. In 1932 he hit 58 home runs, his highest single-season output. He was with the Boston Red Sox of the American League (1936—mid-1942), hitting 50 home runs and batting in 175 runs in 1938. Subsequently he played for Chicago and Philadelphia in the National League. In 1932, 1933, and 1938 Foxx was chosen the most valuable player in the Amer-

Foxx, 1940

UPI—EB Inc

ican League. He was elected to the Baseball Hall of Fame in 1951.

Foy, Eddie, in full EDWIN FITZGERALD FOY (b. March 9, 1856, New York City—d. Feb. 16, 1928, Kansas City, Mo., U.S.), U.S. comedian famous on the vaudeville circuit in the late 19th and early 20th century.

As a child he sang and danced in the streets of New York and Chicago to help support his

Eddie Foy

Culver Pictures

family. He gained his first professional recognition in the mining camps and cow towns of the West, beginning around 1878. He returned to Chicago in 1888 as the star comedian in variety shows and revues. Between 1904 and 1913 he played the leading comic roles in a series of musical comedies in New York City, among them *Piff! Paff! Poff!* and *The Earl and the Girl*. He entered vaudeville in 1913 with a highly successful act that included his seven children and appeared with them in one motion picture. Foy retired in 1923 but returned to the stage in 1927 and died while on a farewell tour. His son Eddie Foy, Jr. (1905–83) was active in vaudeville, films, the musical and legitimate stage, and television.

Foy, Maximilien(-Sébastien) (b. Feb. 3, 1775, Ham, Fr.—d. Nov. 28, 1825, Paris), French military leader, writer, and statesman who fought in the Napoleonic Wars (1800–15) and emerged as a leading spokesman of the liberal opposition during the early years after the Bourbon Restoration (1815).

Foy served in the artillery and the infantry, attaining the rank of brigadier general in 1808. He voted against the Consulate and against the Empire, but his exceptional military abilities kept him in the service of Napoleon's armies. He distinguished himself in the Rhineland and the Middle East and especially in less successful campaigns in Portugal and Spain. After Napoleon's final defeat at Waterloo (1815), Foy retired from military life and published what was to remain an incomplete *Histoire des guerres de la Péninsule* (1819; *History of the Peninsular War, Under Napoleon*). In 1819 he was elected to the Chamber of Deputies from the Aisne *département*, where he led the liberal opposition until his death. Foy's funeral was the occasion of a demonstration against the Bourbons in which more than 100,000 persons participated. In 1826 a two-volume edition of his speeches, *Discours du général Foy*, was published.

foyer, intermediate area between the exterior and interior of a building, especially a theatre. Originally the term was applied only to that area in French theatres, comparable to the greenroom in English theatres, where actors relaxed when they were offstage. Because actors were often visited by friends, such areas came to be large and handsomely decorated.

In older French opera houses there were three foyers: one each for the public, the ballet, and the singers. In the United States the foyer is simply the vestibule or entrance area of a theatre, and the name is also applied to lobbies of public buildings and apartment houses and even to entryways of private homes.

Foyle, Lough, Irish LOCH FEABHAIL, inlet on the north coast of Ireland between the Inishowen Peninsula (mainly County Donegal, Ireland) to the west and the district councils of Limavady and Londonderry, Northern Ireland, to the east and southeast. The lough is 16 miles (26 km) long and varies in breadth from 1 to 10 miles (1.6 to 16 km). The narrowest points are at the southwestern end, where the River Foyle enters the lough, and at the northeastern end, opposite Magilligan Point. Historic settlements lie on the western shore of the lough, which has long been an important fishing area and passageway.

Foyt, A.J., in full ANTHONY JOSEPH FOYT, JR. (b. Jan. 16, 1935, Houston, Texas, U.S.), versatile and successful American race car driver who won the Indianapolis 500 in 1961, 1964, 1967, and 1977, the first four-time winner.

A racer from the age of 17 and—unlike many drivers—an expert auto mechanic, Foyt participated in his first Indy car race in 1957 and the following year debuted at the Indianapolis 500. In 1960 he won his first Indy Car race and his first of seven national championships. For much of the next two decades Foyt dominated Indy car racing, winning 67 titles. An extremely versatile driver, he also successfully competed in sports-car and stock-car racing. His seven National Association for Stock Car Auto Racing (NASCAR) wins include the 1972 Daytona 500. With co-driver Dan Gurney, Foyt won Le Mans, a 24-hour race, in 1967. In 1993 he retired from professional driving but remained involved with the sport as owner of a racing team. The first inductee into the Motorsports Hall of Fame (1989), Foyt was named, along with Mario Andretti, driver of the century in 1999.

Fra Mauro, heavily eroded crater on the Moon, named for a 15th-century Italian monk and mapmaker. About 80 km (50 miles)

across, Fra Mauro lies at about 6° S, 17° W, in the Nubium Basin (Mare Nubium) impact structure. The name is also applied to the extensive surrounding region, the Fra Mauro Formation, which is thought to be material ejected from the impact that formed the giant Imbrium Basin (Mare Imbrium) to the north. A valley within the formation and north of Fra Mauro crater was the site of the Apollo 14 manned lunar landing in February 1971.

Fracastoro, Girolamo, Latin HIERONYMUS FRACASTORIUS (b. c. 1478, Verona, Republic of Venice [now in Italy]—d. Aug. 8, 1553, Caffi [now Affil], near Verona), Italian physician, poet, astronomer, and geologist, who proposed a scientific germ theory of disease more than 300 years before its empirical formulation by Louis Pasteur and Robert Koch.

Fracastoro studied at the University of Padua, and as a physician he maintained a private practice in Verona. He is best-known for "Syphilis sive morbus Gallicus" (1530; "Syphilis or the French Disease"), a work in rhyme giving an account of the disease, which he named. He made an intense study of epidemic diseases, and, while in the service of Pope Paul III at the Council of Trent (1545–63), he provided the medical justification for the removal of the council to Bologna by pointing out the danger of plague in the town of Trent.

Fracastoro outlined his concept of epidemic diseases in *De contagione et contagiosis morbis* (1546; "On Contagion and Contagious Diseases"), stating that each is caused by a different type of rapidly multiplying minute body and that these bodies are transferred from the infector to the infected in three ways: by direct contact, by carriers such as soiled clothing and

Fracastoro, engraving
Giraudon—Art Resource

linen, and through the air. Although microorganisms had been mentioned as a possible cause of disease in the 1st century BC, Fracastoro's was the first scientific statement of the true nature of contagion, infection, disease germs, and modes of disease transmission. Fracastoro's theory was widely praised, but its influence was soon obscured by the mystical doctrines of the Renaissance physician Paracelsus, and it fell into general disrepute until it was proved by Koch and Pasteur.

fractal, in mathematics, any of a class of complex geometric shapes that commonly have "fractional dimension," a concept first introduced by the mathematician Felix Hausdorff in 1918. Fractals are distinct from the simple figures of Euclidean geometry. The term *fractal*, derived from the Latin word *fractus* ("fragmented," or "broken"), was coined by the Polish-born mathematician Benoit B. Mandelbrot. Although the key concepts associated with fractals had been studied for years, Mandelbrot was the first to point out that fractals could be an ideal tool for

modeling a variety of phenomena from physical objects to the behaviour of the stock market. Since its introduction in 1975, the concept of the fractal has given rise to a new system of geometry that has had a significant impact on such diverse fields as physical chemistry, physiology, and fluid mechanics.

Many fractals possess the property of self-similarity. A self-similar object is one whose component parts resemble the whole. This reiteration of details or patterns occurs at progressively smaller scales and can, in the case of purely abstract entities, continue indefinitely. In effect, a self-similar object remains invariant under changes of scale. This fractal phenomenon can often be detected in such objects as snowflakes and tree barks. All natural fractals of this kind, as well as some mathematical self-similar ones, are random; they thus scale in a statistical sense.

Another key characteristic of a fractal is a mathematical parameter called its fractal dimension. Unlike Euclidean dimension, fractal dimension is generally expressed by a fraction rather than by a whole number. Fractal dimension can be illustrated by considering a specific example: the snowflake curve defined by Helge von Koch in 1904. Beginning with an equilateral triangle, the Koch curve is produced by repeatedly replacing the middle third of each side with two new line segments of the same length that meet exterior to the figure; it resembles a snowflake with six-fold symmetry. It is self-similar in that it consists of three identical parts, each of which in turn is made of four parts that are exact scaled-down versions of the whole. It follows that each of the four parts itself consists of four parts that are scaled down versions of the whole. There would be nothing surprising if the scaling factor were also four, since that would be true of a line segment or a circular arc. However, for the Koch curve, the scaling factor at each stage is three. The fractal dimension, D , denotes the power to which 3 must be raised to produce 4—*i.e.*, $3^D = 4$. The dimension of the snowflake curve is thus $D = \log 4 / \log 3$, or roughly 1.26. Fractal dimension is a key property and an indicator of the complexity of a given figure.

Fractal geometry has been applied increasingly in statistical mechanics, notably when dealing with physical systems consisting of seemingly random features. For example, fractal simulations have been used to plot the distribution of galaxy clusters throughout the universe and to study problems related to fluid turbulence. Fractal algorithms have also made it possible to generate lifelike computer-graphic images of highly irregular natural objects, such as the rugged terrain of mountains and the intricate branch systems of trees.

fractional reserve system, also called MINIMUM RESERVE SYSTEM, banking system followed by all modern banks in which less than 100 percent of bank deposits are held as reserves. The portion of the money not held as reserves is used to earn income by means of loans and investments; some of this portion eventually returns to the banking system as new deposits. Thus, the banking system is able to expand the money supply through the creation of new demand deposits.

Banks do not have unlimited freedom to expand deposits but must usually maintain required reserves, which may be held as currency or as deposits at the central bank. The ratio of the required reserves to a bank's total deposits may be set by custom or by law; use of legally required reserves appears to have originated in the United States. The fractional reserve system is strengthened by the ability of banks to liquidate some of their assets quickly by calling in loans, selling short-term securities, or borrowing cash from the central bank.

fracture, in mineralogy, appearance of a surface broken in directions other than along cleavage planes. Fracture types include conchoidal (curved concavities resembling shells—*e.g.*, flint, glass); even (rough, approximately plane surfaces); uneven (rough and

Slate, a metamorphic rock, showing typical splintery fracture and thin layering (slightly larger than life size)
John H. Gerard

completely irregular surfaces, the commonest fracture type); hackly (sharp, jagged edges—*e.g.*, most metals); and splintery (partially separated splinters or fibres—*e.g.*, jadeite. See also cleavage.

fracture, in pathology, a break in a bone, caused by stress. Certain normal and pathological conditions may predispose bones to fracture. Children have relatively weak bones

Types of fractures of bone
Encyclopædia Britannica, Inc

because of incomplete calcification, and older adults, especially women past menopause, develop osteoporosis, a weakening of bone concomitant with aging. Pathological conditions involving the skeleton, most commonly the spread of cancer to bones, may also cause weak bones. In such cases very minor stresses may produce a fracture. Other factors, such as general health, nutrition, and heredity, also have effects on the liability of bones to fracture and their ability to heal.

A fracture is called simple (closed) when the overlying skin is not broken and the bone is not exposed to the air; it is called compound (open) when the bone is exposed. When a bone weakened by disease breaks from a minor stress, it is termed a pathological fracture. An incomplete, or greenstick, fracture occurs when the bone cracks and bends but does not completely break; when the bone does break into separate pieces, the condition is called a complete fracture. An impacted fracture occurs when the broken ends of the bone are jammed together by the force of the injury. A comminuted fracture is one in which the broken ends of the bone are shattered.

The most common symptoms of fracture are pain and tenderness at the site, a sensation of grating or grinding with movement, and in-

ability to use the limb or body part supported by the bone. Physical signs include deformity of the part, swelling in the region of the fracture, discoloration of the overlying skin, and abnormal mobility of the bone.

All fractures attempt to heal in the same fashion. The injured bone quickly produces new tissue that extends across the fracture line and joins the broken pieces together. At first this new tissue is soft and puttylike; later, bony and hard. While re-forming, the bone must be protected from weight bearing and movement between the fracture ends.

The major complications of fracture include failure to heal, healing in a position that interferes with function, and loss of function despite good healing. Failure to heal is frequently a result of infection. Because healing will not ordinarily take place until infection is brought under control, all procedures are aimed at combating infection at the site of injury whenever the possibility exists (as in compound fractures). Failure to heal may also result from severe destruction of bone, disruption of blood supply, or inadequate immobilization of the limb or body part involved; sometimes the cause cannot be determined. Healing is encouraged by cleansing of the fracture site, closure of the overlying broken skin by suture or skin graft, and reimmobilization; bone chips may be used to fill a gap in the fractured bone left by long infection or severe bone destruction. Healing in a poor position, or malunion, may occur when realignment has been improper or when injuries have destroyed large portions of the bone so that deformity must be accepted to salvage it. Sometimes the bone is refractured therapeutically so that proper alignment may be achieved. Injuries to the growth centres of bones in children cause malunion and subsequent growth in a deformed manner.

Fractures in joints present a particularly serious problem because the normally smooth surface of the joint may be destroyed. If the fracture heals in irregular alignment, the joint is likely to be permanently stiff and painful; osteoarthritis is a frequent complication in old age. Unless the surface of the joint can be accurately aligned by manipulation or traction, surgery is necessary. Loss of function may be caused by prolonged immobilization, by heavy scarring after severe injury or infection, or by injury to motor nerves.

fracture-dislocation, a severe injury in which both fracture and dislocation take place simultaneously. Frequently, a loose piece of bone remains jammed between the ends of the dislocated bones and may have to be removed surgically before the dislocation can be reduced. Chances for permanent stiffness or disability are greater than in uncomplicated dislocation or fracture.

Fraenkel-Conrat, Heinz L., in full HEINZ LUDWIG FRAENKEL-CONRAT (b. July 29, 1910, Breslau, Ger. [now Wrocław, Pol.]—d. April 10, 1999, Oakland, Calif., U.S.), German-American biochemist who helped to reveal the complementary roles of the structural components of viruses (a "core" of ribonucleic acid [RNA] enveloped by a protein "coat"). Fraenkel-Conrat studied medicine at the University of Breslau (M.D., 1933) and then turned to biochemistry at the University of Edinburgh (Ph.D., 1936). He moved to the United States in 1936 and became a U.S. citizen in 1941. He worked for 10 years at the U.S. Department of Agriculture's Western Regional Research Laboratory and joined the faculty of the University of California, Berkeley, in 1952, becoming a professor emeritus in 1981.

In a series of experiments on the tobacco mosaic virus, Fraenkel-Conrat disassembled the virus into its noninfectious protein and nearly noninfectious nucleic acid components, and then, by recombining these components, succeeded in effecting the reconstitution of the

fully infective virus. Studies of this reconstitution reaction led to the discovery that viral infectivity resides in the nucleic acid portion of the virus, which in the absence of the viral protein is broken down by RNA-splitting enzymes, or nucleases.

fragile-X syndrome, a chromosomal disorder associated with a fragile site on the end of the X chromosome. The major symptom of the syndrome is mental retardation.

The X chromosome is one of two sex chromosomes (the other being the Y chromosome). Males have one X and one Y chromosome; females have two X chromosomes. The male who receives the fragile-X chromosome will be affected by the syndrome, which is thought to be one of the major causes of mental retardation in males. About one-third of the females who receive one fragile-X chromosome show mild mental retardation; the remaining two-thirds, though intellectually normal, have a 50-50 risk of passing the defective chromosome on to each of their children.

Fragonard, Jean-Honoré (b. April 5, 1732, Grasse, Fr.—d. Aug. 22, 1806, Paris), French Rococo painter whose most familiar works, such as "The Swing" (c. 1766), are characterized by delicate hedonism.

Fragonard was the son of a haberdasher's assistant. The family moved to Paris about 1738, and in 1747 the boy was apprenticed to a lawyer, who, noticing his appetite for drawing, suggested that he be taught painting. François Boucher was prevailed upon to accept him as a pupil (c. 1748), and in 1752, Fragonard's elementary training completed, Boucher recommended that he compete for a Prix de Rome scholarship, which meant study under the court painter to Louis XV, Carle Van Loo, in Paris. On Sept. 17, 1756, Fragonard set off for the French Academy at Rome.

At the academy Fragonard copied many paintings, and, with his friend the French painter Hubert Robert, made numerous sketches of the Roman countryside. When his scholarship ended in July 1759, he was allowed to remain in residence until, in late November, he met a wealthy amateur artist, the Abbé de Saint-Non, who was to become one of his chief patrons. Early in 1760 Saint-Non took Fragonard and Robert on a prolonged tour of Italy, where the two artists studied Italian paintings and antiquities and made hundreds of sketches of local scenery.

In 1761, after returning to Paris, Fragonard exhibited a few landscape paintings and the large "Coresus Sacrifices Himself to Save Callirhoe" at the Salon, where it was purchased for King Louis XV. Consequently,

"The Swing," detail, oil on canvas by Jean-Honoré Fragonard, c. 1766; in the Wallace Collection, London

By courtesy of the trustees of the Wallace Collection, London

the artist was commissioned to paint a pendant, or companion piece, granted a studio in the Louvre Palace, and accepted as an Academician. Nevertheless, after 1767 he almost ceased to exhibit at the salons, concentrating on landscapes, often in the manner of the 17th-century Dutch painter Jacob van Ruisdael ("Return of the Herd," Worcester); portraits; and decorative, semierotic outdoor party scenes ("The Swing") in the style of Boucher but more fluently painted. His admiration for Rembrandt, Peter Paul Rubens, Frans Hals, and a Venetian contemporary, Giovanni Battista Tiepolo, emerges in a large series of loosely and vigorously executed heads of old men, painted probably between 1760 and 1767 ("Head of an Old Man"), followed by a series of portraits (c. 1765–72) in a similar style and in which the sitters were real persons, but their fantastic costumes were emphasized rather than facial expressions.

In 1769 he married Marie-Anne Gérard from Grasse and shortly afterward received the accolade of fashion, when in 1770 he was commissioned by Mme du Barry to decorate her newly built Pavillon de Louveciennes, with four large paintings ("Progress of Love," Frick Collection, New York City), and in 1772 he received a somewhat similar commission from the notorious actress Madeleine Guimar. Neither was a success, the Louveciennes paintings probably being rejected as too Rococo for a totally Neoclassical setting.

A journey to the Low Countries perhaps in 1772–73 increased his admiration for Rembrandt and Hals and was reflected in his later portraits. A second visit to Italy followed in 1773–74. As before, he concentrated on drawing picturesque Italian landscape subjects rather than on painting. The return journey was taken through Vienna, Prague, and Germany. On his return to Paris, the family was joined by his wife's 14-year-old sister, Marguerite, with whom Fragonard fell passionately in love. Consequently, he turned his interests toward a new type of subject matter: domestic scenes inspired by Jean-Jacques Rousseau's moral philosophy or romantic novels ("The Happy Family") or scenes concerned with children's upbringing, in which his son Évariste (born 1780) frequently figures ("The Schoolmistress").

In the last years preceding the French Revolution, Fragonard turned finally to Neoclassical subject matter and developed a less fluent Neoclassical style of painting ("The Fountain of Love"), which becomes increasingly evident in his later works, particularly the genre scenes executed in collaboration with Marguerite Gérard ("The Beloved Child").

Fragonard's art was too closely associated with the pre-Revolutionary period to make him acceptable during the Revolution, which also deprived him of private patrons. At first he retired to Grasse but returned to Paris in 1791, where the protection of the leading Neoclassical painter Jacques-Louis David obtained for him a post with the Museum Commission, but he was deprived of this in 1797. He spent the rest of his life in obscurity, painting little. His death in 1806 passed almost unnoticed, and his work remained unfashionable until well after 1850.

Fragonard has been bracketed with Watteau as one of the two great poetic painters of the unpoetical 18th century in France. A prodigiously active artist, he produced more than 550 paintings, several thousand drawings (although many hundreds are known to be lost), and 35 etchings. His style, based primarily on that of Rubens, was rapid, vigorous, and fluent, never tight or fussy like that of so many of his contemporaries.

Although the greater part of his active life was passed during the Neoclassical period, he continued to paint in a Rococo idiom until shortly before the French Revolution. Only five paintings by Fragonard are dated, but the

chronology of the rest can be fairly accurately established from other sources such as engravings, documents, etc. (F.J.B.W.)

BIBLIOGRAPHY. Fragonard as a painter is discussed in Georges Wildenstein, *The Paintings of Fragonard: Complete Edition* (1960). It includes a concise critical bibliography of the essential manuscript and printed sources. Edmond de Goncourt and Jules de Goncourt, *French Eighteenth Century Painters* (1948, reprinted 1981), includes an 1865 essay on the artist. Jacques Thuillier, *Fragonard: Biographical and Critical Study*, rev. ed. (1987), and Dore Ashton, *Fragonard in the Universe of Painting* (1988), are significant works. Jean-Pierre Cuzin, *Fragonard* (1988), and Pierre Rosenberg, *Jean-Honoré Fragonard, Life and Work: Complete Catalogue of the Oil Paintings* (1988), are well-illustrated interpretative studies in English translation. Later studies include Mary D. Sheriff, *Fragonard: Art and Eroticism* (1990); and Jean Montague Massengale, *Jean-Honoré Fragonard* (1993).

Frame, Janet, in full JANET PATERSON FRAME CLUTHA (b. Aug. 28, 1924, Dunedin, N.Z.—d. Jan. 29, 2004, Dunedin), leading New Zealand writer of novels, short fiction, and poetry.

Frame was the daughter of an impoverished railway engineer and was educated in New Zealand. Her early memories of poverty, the deaths of two sisters, and several stays in psychiatric hospitals provided much of the impetus for her work. During her hospitalization, she read the classics voraciously and then began to write.

Her first book, *The Lagoon* (1951), is a collection of short stories expressing the sense of isolation and insecurity of those who feel they do not fit into a normal world. *Owls Do Cry* (1957), an experimental novel, expands upon the theme of *The Lagoon*. Incorporating both poetry and prose and lacking a conventional plot, *Owls Do Cry* investigates the worth of the individual and the ambiguous border between sanity and madness. In all her novels, Frame depicted a society deprived of wholeness by its refusal to come to terms with disorder, irrationality, and madness.

Among her other novels are *Faces in the Water* (1961), *The Edge of the Alphabet* (1962), *Snowman, Snowman: Fables and Fantasies* (1963), *Scented Gardens for the Blind* (1963), *The Adaptable Man* (1965), *A State of Siege* (1966), *The Rainbirds* (1968), *Intensive Care* (1970), *Daughter Buffalo* (1972), and *Living in the Maniototo* (1979).

She wrote three volumes of memoirs, *To the Is-land* (1982), *An Angel at My Table* (1984), and *The Envoy from Mirror City* (1985).

frame design, decorative treatment of frames for mirrors and pictures. Before the 15th century in Europe, frames hardly existed separately from their architectural setting and, with the altarpieces or the predellas they surrounded, formed an integral part of the decorative scheme of the church interior. Such frames were frequently burnished with gold leaf. During the 15th century, when paintings were more generally used as secular wall decorations and domestic furnishings, frames began to be designed independently of their surroundings.

A type of picture frame with exuberant wood carving evolved during the Italian Baroque period, and it has never been completely abandoned. This practice of framing mirrors and paintings in a manner that reflects the architectural and artistic movements of the day continued into the 21st century. During the Neoclassical period in the last third of the 18th century, both on the Continent and in England, there was a return to simpler outlines and a greater austerity in frame ornament. Composition and plaster frames became popular. After the first two decades of the 19th century, frame design became increasingly

eclectic, many being based on styles of the previous century.

In the greater part of the 20th century, the trend was toward an ever-increasing simplicity that would complement contemporary emphasis on minimalism. The use of plain, minimal-width frames, as well as materials such as metals and molded plastic, reflected this movement. Ornamental molded frames, however, have retained their popularity for use with older paintings.

frame harp, musical instrument in which the neck and soundbox are joined by a column, or forepillar, which braces against the tension of the strings. It is one of the principal forms of harp and in modern times is found exclusively in Europe and among the Ostyak, a Finnish people of western Siberia.

Frame harps are known to have existed in Europe by the 9th century AD and in Ireland by the 8th. Their origin is not known; among many speculations are that they were brought to northern Europe by westward-migrating (possibly Celtic) tribes or that they developed indigenously.

Early medieval frame harps evolved in form, eventually developing an incurved neck and a deeply outcurved forepillar. Apparently they were normally strung with wire. By about 1400 this form was superseded by the so-called Gothic harp, having a taller, shallow soundbox; a short, less deeply curved neck; and a

Musician (centre) playing a frame harp in the orchestra of the court of René II, duke of Lorraine, detail of a miniature painting from a 15th-century psalter (musician at right playing a fiddle); in the Bibliothèque Nationale, Paris (MS. lat. 10491)

By courtesy of the Bibliothèque Nationale, Paris

more slender, almost straight forepillar. By the 16th century this instrument normally had gut strings. The earlier form gave rise to the medieval Irish harp, or clairsach, the second to the modern orchestral (double-action pedal) harp.

Frame harps were also known in medieval China (considered there to be of European origin), ancient and medieval Syria, and, according to some scholars, occasionally elsewhere in the ancient Middle East.

frame story, overall unifying story within which one or more tales are related. In the single story, the opening and closing constitutes a frame. In the cyclical frame story—that is, a story in which several tales are related—some frames are externally imposed and only loosely bind the diversified stories. For example, the *Jātaka*, a treasury of about 550 ancient Indian folktales, is cast within a framework of Buddhist ethical teaching. *The Thousand and One Nights*, in which Scheherazade avoids death by telling her king-husband a story every night and leaving it incomplete, is another example of a frame story.

Other frames are an integral part of the tales, as in Boccaccio's *Decameron*, in which a group of 10 people fleeing the Black Death gather in the countryside and as an amusement relate 10 stories each; the stories are woven together by a common theme, the way of life of the refined bourgeoisie, who combined respect for conventions with an open-minded attitude to personal behaviour. In Chaucer's *Canterbury Tales*, too, the pilgrimage frame brings together the varied tellers of the tales, who emerge as vivid personalities and develop dramatic relationships among themselves and with their tales.

framed building, structure in which weight is carried by a skeleton or framework, as opposed to being supported by walls. The essential factor in a framed building is the frame's strength. Timber-framed or half-timbered houses were common in medieval Europe. In this type the frame is filled in with wattle and daub or brick. A modern lightweight wood-frame structure, the balloon-frame house with wood cladding, was invented in Chicago and helped make possible the rapid settlement of the western United States. The framed building enjoyed an extensive revival after World War II as the basic form of American suburban housing.

Steel and reinforced concrete are the most common materials in large contemporary structures. During the 19th century, brick or stone walls continued to bear loads, though cast-iron framing was sometimes used supplementarily, being embedded in walls or sometimes freestanding. True skeletal construction on a large scale was first achieved in Chicago by William Le Baron Jenney in the Home Insurance Company Building (1884–85). This building featured a frame of both iron and steel. In the 20th century reinforced concrete emerged as steel's main competitor.

The French architect Auguste Perret was the first to give external expression to a framed building (1903); he exposed as much as possible the reinforced-concrete framework of his buildings and eliminated most nonstructural elements. Contemporary architecture has done away with most traditional walls altogether by the use of metal and glass screens, or curtain walls, as exterior cladding.

Framingham, town, Middlesex county, eastern Massachusetts, U.S. It lies along the Sudbury River, 21 miles (34 km) west of Boston. Settled in 1650, it was incorporated in 1700 and derived its name from Framlingham, Suffolk, Eng. Framingham Center, just north of the downtown area, was the original village. Framingham's industrial development dates from 1835, with the utilization of local water-power and the advent of the railroad. Textile mills and carpet manufacturing were important during the 19th century, but the town's diversified economy now also includes automobile assembly, printing and publishing, and the manufacture of computer components, machinery, hats, and rubber products. Framingham is the site of Shoppers' World, one of New England's first planned suburban shopping complexes. Framingham State College

was founded in 1839 at Lexington and relocated in 1853. The State Reformatory for Women is in the town. Pop. (2000) 66,910.

Frampton, Sir George James (b. June 16, 1860, London, Eng.—d. May 21, 1928, London), English sculptor and craftsman, the creator of some noted public monuments.

Frampton studied under W.S. Frith and at the Royal Academy schools, where he won a traveling studentship. In 1888–90 he studied in Paris under Marius Jean-Antonin Mercié, by whom he was much influenced. At the beginning of the 1890s he was attracted by the Arts and Crafts Movement and experimented with decorative sculpture, using materials such as bronze, ivory, marble, and jewels combined in one work. His principal statues include those of Mrs. Alice Owen at Owen's School, Islington, London; Queen Victoria at Calcutta, India, at Leeds and Southport, Eng., and at Winnipeg, Man., Can.; and (all in London) Quintin Hogg in Langham place, Peter Pan in Kensington Gardens, and Edith Cavell in St. Martin's Lane. Frampton became a royal academician in 1902 and was knighted in 1908.

franc, originally a French coin but now also the monetary unit of a number of countries, notably Switzerland, most French and former Belgian overseas territories, and some African states; at one time it was also the currency of France, Belgium, and Luxembourg. The name was first applied to a gold coin minted by King John II of France in 1360, which bore on one face the Latin legend *Johannes Dei gratia Francorum rex* ("John, by the grace of God, king of the Franks"). Because this coin also carried the figure of the king on horseback, it was known as the *franc à cheval* to distinguish it from another coin of the same value later issued by Charles V of France. This latter coin was called the *franc à pied* because it showed the monarch standing on foot under a canopy. During the 17th century the minting of gold francs ceased, but the name was freely applied by the French public to the new unit of exchange—the *livre tournois*, a gold coin subdivided into 20 sols. In 1795, to symbolize the political changes that followed the French Revolution, the republican government introduced a new franc currency. The first coin was a five-franc silver piece; gold coins worth 20 francs (napoleons) were coined in quantity later. The *livre tournois*, which was exchangeable into the new currency at a rate of 81 livres to 80 francs, continued to circulate in France until 1834.

The franc was formally established as the monetary unit of France in 1799 and made divisible into 10 decimos and 100 centimes. The Swiss franc was adopted by France's client state, the Helvetic Republic (made up of cantons of Switzerland) in 1799. The Belgian franc was adopted by Belgium in 1832, after independence. The Luxembourg franc was adopted in 1848 in place of the Dutch guilder. In 2002 the franc ceased to be legal tender in France, Belgium, and Luxembourg after the euro, the monetary unit of the European Union, became those countries' sole monetary unit.

Most of France's foreign colonies attained independence in the 1950s and early '60s, and many of the resulting Saharan and sub-Saharan African nations retained the name franc for their own basic monetary units. These countries, most of which formerly constituted French West Africa and French Equatorial Africa, became members of the Franc Zone; their currencies were linked to the French franc at a fixed rate of exchange and were freely convertible into that franc. In 1999, however, as France began to phase out the French franc, the currencies became linked to the euro.

Franca, city, in the highlands of northeastern São Paulo *estado* ("state"), Brazil. It lies at

3,314 feet (1,010 m) above sea level. Known variously as Vila Franca del Rei and Vila Franca do Imperador, it was given town status in 1824 and was made the seat of a municipality in 1856. The city has one of the largest sugar refineries in Brazil; coffee, rice, corn (maize), cotton, and *feijão* (beans) are also grown locally. Industries in the city manufacture furniture, shoes, vehicles, chemicals, pharmaceuticals, and other products. Goods travel by rail and road to São Paulo city, 236 miles (380 km) south, and to other centres in São Paulo and neighbouring Minas Gerais states. Franca also has an airfield. Pop. (2000) 287,400.

France, officially FRENCH REPUBLIC, French FRANCE, or RÉPUBLIQUE FRANÇAISE, country in western Europe. The capital is Paris. France is bordered on the northeast by Luxembourg and Belgium, on the northwest by the English Channel, on the west by the Atlantic Ocean and the Bay of Biscay, on the south by Spain, Andorra, and the Mediterranean Sea, and on the east by Italy, Switzerland, and Germany. The island of Corsica in the Mediterranean is an integral part of France. Area 210,026 square miles (543,965 square km). Pop. (2002 est.) 59,440,000.

A brief treatment of France follows. For full treatment, see MACROPAEDIA: France.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Three main geological regions are distinguishable: the worn remains of the ancient mountains that make up the Hercynian massifs (the Ardennes, the Vosges, the Massif Central, and the Massif Armorican); the northern and western plains (the Paris Basin, the Loire plains, the Aquitaine Basin, and the Alsace Plain); and the higher young fold mountains of the south and southeast, including the Pyrenees, the Jura, and the Alps, with the adjoining narrow Saône and Rhône plains. The Massif Central, the largest of the Hercynian massifs, covers an area of about 35,000 square miles (91,000 square km) and attains a height of 6,188 feet (1,886 m) at Puy de Sancy. The lowlands lie below 1,000 feet (300 m) and cover about two-thirds of France. The Paris Basin lies to the north and northwest of the Massif Central and is drained by the Seine River and its tributaries. The Pyrenees stretch for more than 280 miles (450 km), forming a natural barrier between France and Spain. The Jura Mountains, extending into Switzerland, are composed of folded limestones. They reach their highest elevation at Mount Neige (5,653 feet [1,723 m]) in France. The French Alps were formed in a series of foldings that lasted from the beginning of the Tertiary to the Quaternary period (from about 66.4 to 1.6 million years ago). Their highest point is Mont Blanc (15,771 feet [4,807 m]). Between these young mountains are the Saône and the

France

Rhône plains, which extend southward to the Rhône delta. West of the delta lies the featureless Languedoc coastal plain and to the east is the Côte d'Azur region, with its internationally known resort area, the French Riviera. The river systems of France are determined by a major divide that runs from the southern part of the Vosges in the northeast to the Massif Central in the south. Along this divide originate most of the westward-flowing rivers, including the Seine and the Loire.

France's climate is generally moderate, combining Atlantic, Mediterranean, and continental influences. Winters are generally mild outside the mountains and Alsace in north-eastern France. The northwest is characterized by its low monthly temperature variation, Brest having an average temperature of 43° F (6° C) in January and 61° F (16° C) in July; by its extreme humidity and moderate rainfall (35 inches [900 mm]); and by the frequency of gale-force winds. The climate of the Paris Basin is a mixture of both maritime and continental influences. The average annual temperature is 53° F (11° C), and average annual precipitation is about 23 inches (585 mm) in Paris. The Mediterranean climate of the south-east is characterized by mild winters, heavy precipitation during autumn and spring, dry summers, and violent northerly winds called the mistral. Nice, which lies on the Mediterranean coast, has an average temperature of 47° F (8° C) in January and only a few days of frost. The average annual rainfall for most of the country is from 30 to 40 inches (760 to 1,000 mm), with the mountainous areas having more than 60 inches (1,500 mm) and often nearly 80 inches (2,000 mm) a year.

About three-fifths of the land is suitable for agriculture, and France has some of the world's best cereal-growing land. About one-half of the country's arable land is used for cereals, chiefly wheat and corn (maize), but also including barley and oats. Vines, fruits, and vegetables cover only a limited area but represent more than one-fifth of the total value of agricultural output. Forests cover approximately one-fourth of the land area.

After decades of exploitation of iron-ore deposits in Lorraine, France ranks among the world's leading producers of iron ore. It also has sizable reserves of tungsten, arsenic, diatomite, gypsum, magnesium, bauxite, lead, and zinc. It has limited reserves of petroleum, natural gas, and coal.

The people. The French consider themselves a single race and a single nation, but they are actually amalgams of ethnic strains that overlapped during centuries of invasions and migrations.

About three-fourths of the French people belong to the Roman Catholic church. Other religious groups of sizable numbers include Protestants of various denominations, Jews, and Muslims. A significant portion of the population is also atheist. French is the national and official language, spoken and taught everywhere and its integrity jealously guarded as government policy. Occitan, Basque, and German continue to be spoken in some areas, and there are many regional dialects of French. The birth rate is about average for Europe as a whole, which is about one-half the world average. The death rate is also about average for Europe, while the net migration is negligible. The largest cities are Paris, Marseille, Lyon, Toulouse, Nice, Strasbourg, Nantes, Bordeaux, and Saint-Etienne.

The economy. France has a developed, mixed economy in which both public and private sectors participate. Successive governments have promoted varied economic activities, which are determined by the country's national plans. Some nationalization of industry has taken place. The gross national product (GNP) is growing faster than the population, and the GNP per capita is about average for a developed, highly industrialized country.

Although France is the leading agricultural country in western Europe, the agricultural sector accounts for less than one-twentieth of the gross domestic product (GDP) and employs about one-twelfth of the work force. Government efforts to revitalize agriculture have involved the consolidation of farm units and greater emphasis on the use of fertilizers and irrigation. France is a major exporter of wine, dairy products, wheat, and tinned fruits and vegetables. The country's agricultural imports include fruits and vegetables and meat and meat preparations.

Roundwood production is among the highest in western Europe. The forests, however, remain largely unexploited. Despite the extent of France's coastline, the fishing industry remains relatively small. The principal fish landed are pollock, cod, tuna, halibut, sardine, and mackerel. A considerable quantity of shellfish, especially oysters, is also collected.

Production of coal, iron ore, and bauxite has been declining since the 1960s. The government offers extensive subsidies for modernization and diversification of production in the mineral industries.

France is one of the major economic powers of the world, ranking along with such countries as the United States, Japan, and Germany. Manufacturing accounts for approximately one-fourth of the GDP and employs slightly more than that proportion of the work force. Efforts to modernize and restructure French industry have been made difficult by a relative scarcity of very large firms and a preponderance of very small ones. The government owns certain large-scale industries and has actively encouraged mergers; subsidies have allowed selected French products to compete advantageously in world markets. Major manufactures include steel, motor vehicles, aircraft, mechanical and electrical products, textiles, chemicals and pharmaceuticals, and food products.

The government controls the generation and distribution of most electricity. Electricity in France has increasingly been generated by nuclear-power plants.

Services account for almost two-thirds of the GDP and employ more than one-half of the work force.

Public expenditures generally exceed revenues. Most banks and industries were nationalized by the socialist government elected in 1981, which also increased the minimum wage, expanded social-benefit programs, and rescheduled the income tax in favour of those with low incomes. Some banks and industrial enterprises were subsequently returned to the private sector, however.

France is one of the world's largest trading nations. Imports, composed largely of machinery, chemicals and chemical products, agricultural products, and fuels, tend to exceed exports. France remains a major exporter of automobiles, electrical machinery, and metal products. A large percentage of France's trade is with members of the European Community (EC), of which it was a founding member.

France has a highly developed transportation system with extensive highways, inland waterways, and railways. Since the early 1980s certain new lines have been opened in conjunction with the high-speed trains between Paris and other cities in France. Paris is also connected by rail to Geneva and Lausanne in Switzerland. Air France, one of the world's major airlines, provides extensive internal and external service.

Government and social conditions. France has a multiparty democracy dominated by a strong executive. The constitution of the Fifth Republic, adopted in 1958, vests executive authority in the president, who is elected to a seven-year term by popular vote. Article five of this document designates the president as arbiter and guardian of the constitution. The president appoints the prime minister and the

executive minister, presides over the Council of Ministers, and also has the power to hold national referenda and to dissolve the National Assembly after consulting the prime minister and the president of the assembly. In times of national emergency, the president may assume full legislative and executive powers.

Legislative responsibility rests with the bicameral Parliament, which consists of a Senate and a National Assembly. The Senate, which possesses limited legislative power, has 321 members elected to nine-year terms by an electoral college. The National Assembly, France's principal legislative body, comprises 577 members elected to five-year terms by popular vote. The assembly can pass specific laws in such fixed areas as tax liability, nationalization of industries, and declaration of war; however, its authority to legislate is circumscribed in matters concerning national defense, education, finance, and social and economic programs. The prime minister is responsible for the determination of governmental policy and exercises control over the civil service and the armed forces. Several political parties dominate the competition for elective office in France: the Socialist Party, a moderately leftist group; the Gaullist Rally for the Republic, a moderately conservative party; the Union for French Democracy, a union of centrist parties; the right-wing National Front; and the left-wing French Communist Party.

There is a hierarchy of courts in the French judicial system. Civil cases are tried in higher and lower courts, criminal cases are tried in courts of correction, and minor offenses are tried in police courts. The administrative courts, which are under the control of the Council of State, examine cases on appeal. Public law and order are maintained by the police and the gendarmerie, the latter reporting to the minister of defense and having heavier duty in the rural areas.

France pursues a highly independent defense policy; the country belongs to NATO but does not participate in that organization's military structure. The French possess their own nuclear weapons force, consisting of strategic bombers, land-based missiles, submarine-launched missiles, and tactical warheads.

France's comprehensive system of social-welfare benefits covers most employed persons. It provides family allowances as well as old-age, disability, and survivor pensions and work-injury, unemployment, and maternity benefits. Insured residents are also reimbursed for part or all of their medical costs.

Health conditions compare favorably with those of other western European countries. France has a relatively low incidence of infectious disease and an adequate supply of both medical personnel and hospital beds. The country's infant mortality rate is comparatively low for Europe, while life expectancy at birth is a high 72 years for males and 80 years for females.

Education is free and compulsory for children between the ages of 6 and 16. At age 11, after five years of primary education, students enter the first cycle of secondary education. Upon graduation at age 15, students proceed to the second cycle, choosing between a two-year course leading to the *brevet d'études professionnelles* and a three-year course leading to the *baccalauréat*, which is the minimum qualification for entry to higher education. France has many major universities, of which the most notable and renowned is the Sorbonne (founded c. 1257), and several prestigious *grandes écoles*, including institutes such as the École Polytechnique (1794), which has become the most important technical school in France.

The country's news media are free from direct government censorship. The media's de-

pendence on governmental subsidies and the existence of state representation in press and broadcasting councils, however, have sometimes had the effect of forcing journalists to engage in self-censorship.

Cultural life. The French enjoy a highly developed intellectual and artistic life. In literature, one of the most important elements of contemporary French cultural life, the intellectual and humanistic heritage of the past survives. World-renowned French literary figures include Michel de Montaigne, creator of the essay; the 17th-century dramatists Pierre Corneille, Molière, and Jean Racine; and Voltaire, Denis Diderot, Victor Hugo, Charles Baudelaire, Gustave Flaubert, Marcel Proust, George Sand, Albert Camus, Jean-Paul Sartre, and Simone de Beauvoir.

European art was dominated by French artists from the 18th century to the mid-20th century; these individuals include such important and distinctive artists as Jean-Auguste-Dominique Ingres, Eugène Delacroix, Pierre-Auguste Renoir, Claude Monet, Auguste Rodin, and Edgar Degas, among hosts of others. World cinema has been significantly influenced by such French directors as Jean Renoir, François Truffaut, and Jean-Luc Godard. Among prominent French composers have been Camille Saint-Saëns, Claude Debussy, and Maurice Ravel.

History. France has one of the most complete records of human history in all of Europe. Archaeological excavations have uncovered artifacts more than 100,000 years old, which with the long ensuing record indicate continuous settlement of the region from Paleolithic times.

About 1200 BC the Celtic Gauls began a southward and westward migration from the Rhine valley into what is now France and northern Italy. In about 600 BC Ionian Greeks established a trading colony at Massilia (now Marseille). The Romans began their conquest of Gaul in 121 BC, which Julius Caesar completed from 58 to 50 BC. Gaul became thoroughly Romanized during its years of Roman domination.

The decline of Rome left Gaul open to Germanic invasion in the 5th century AD. By the late 6th century, the Salian Franks had gained hegemony over most of Gaul. By the 8th century, the Franks acknowledged the leadership of the Carolingian dynasty, whose greatest member was Charlemagne (Charles I). In the early 9th century, Charlemagne's empire encompassed most of western Europe, but his death brought its division. After 843 the empire's westernmost lands became known as Francia Occidentalis. When the last Carolingian king died in 987, Hugh Capet was elected king of Francia Occidentalis. Though initially weak and ineffectual, the Capetian dynasty lasted until 1328, when its territories included most of modern France except Flanders, Brittany, Burgundy, and Aquitaine.

The throne passed to Philip VI of Valois in 1328, precipitating the struggle with England known as the Hundred Years' War (1337-1453). At its conclusion the Valois were firmly established as France's ruling family, and the English had lost all their French holdings except Calais. By the end of the 15th century both Burgundy and Brittany were in Valois hands, and France approximated its modern boundaries.

During the 16th century, Protestantism spread across France and led to a number of religious and civil wars. The wars between Protestants (Huguenots) and Roman Catholics culminated in the massacre of some 3,000 Huguenots in Paris on the eve of St. Bartholemew's Day in 1572. In the turmoil that followed, Henry IV of Navarre, a Protestant of the house of Bourbon, secured the throne but

ultimately embraced Catholicism to ensure peace.

The statecraft of such royal advisers as the cardinals Richelieu and Mazarin during the 17th century helped to make France the greatest power in Europe. The later Bourbon kings, notably Louis XIV, with his opulent palace at Versailles and his conception of himself as the Sun King, raised monarchical absolutism in France to new heights. But defeats in a series of costly foreign wars during the 18th century lost France several of its overseas territories and brought the country near bankruptcy. The 1789 revolution toppled the king, proclaimed the rights of man, and destroyed the ancien régime. The French Revolution took a bloody turn and ended in a weak government of five directors. Power soon fell into the hands of Napoléon Bonaparte, who ruled France from 1799 to 1814, first as consul, then as emperor (Napoleon I). Napoleon's far-flung military ventures ended in 1815 with his downfall. A limited monarchy was restored and, with the exception of a brief republican period (1848-52), lasted until 1871, when defeat in the Franco-German War (1870-71) brought about the creation of the Third Republic. By the end of the 19th century, France had assembled an extensive colonial empire in Africa, Southeast Asia, and the Pacific Ocean.

The French lost Alsace-Lorraine to the Germans in 1871, but it was returned at the con-

clusion of World War I. After Nazi Germany's invasion of France in 1940, a collaborationist regime was set up at Vichy, headed by Marshal Philippe Pétain. General Charles de Gaulle organized the Free France resistance movement in Britain. France was liberated by Allied and Free French forces in 1944. Parliamentary democracy was restored to France under the Fourth Republic. After the war, France rebuilt its economy and in 1957 was one of the founding members of the European Economic Community (now the European Union).

A costly war against nationalist guerrillas in Indochina and the rising nationalism in Algeria and other French colonies during the 1950s overwhelmed the Fourth Republic. In 1958 de Gaulle returned to public life. As the first president of the Fifth Republic, he presided over the dissolution of most of France's overseas colonies. During the 1960s, France enjoyed an economic boom, and de Gaulle's successors during the 1970s continued to pursue European economic and political integration. In 1981 France elected its first socialist president, François Mitterrand, who served two terms, until 1995. Mitterrand's conservative successor, Jacques Chirac, had to cooperate with a socialist government after 1997. The country enjoyed an economic upswing at the turn of the 21st century.

Kings and presidents of France

<i>Carolingian dynasty</i>		<i>House of Bourbon</i>	
Charles I (Charlemagne, Kingdom of the Franks)	768-814	Henry IV (Henri)	1589-1610
Louis I (Kingdom of the Franks)	840-843	Louis XIII	1610-43
Civil War		Louis XIV	1643-1715
Charles II (Kingdom of the West Franks)	843-877	Louis XV	1715-74
Louis II (Kingdom of the West Franks)	877-879	Louis XVI	1774-92
Louis III (Kingdom of the West Franks)	879-882	Louis (XVII)	1793-95
Carloman (Kingdom of the West Franks)	879-884	<i>First Republic</i>	
Charles (III) (Charles III, Holy Roman Empire)	884-887	National Convention	1792-95
<i>Robertian (Capetian) dynasty</i>		Directorate	1795-99
Eudes	888-898	Consulate (Napoléon Bonaparte)	1799-1804
<i>Carolingian dynasty</i>		<i>First Empire (emperors)</i>	
Charles III	893/898-923	Napoleon I (Napoléon Bonaparte)	1804-14, 1815
<i>Robertian (Capetian) dynasty</i>		Napoleon (II)	1815
Robert I	922-923	<i>House of Bourbon</i>	
Rudolf (Raoul, or Rodolphe)	923-936	Louis XVIII	1814-24
<i>Carolingian dynasty</i>		Charles X	1824-30
Louis IV	936-954	<i>House of Orléans</i>	
Lothair (Lothaire)	954-986	Louis-Philippe	1830-48
Louis V	986-987	<i>Second Republic (president)</i>	
<i>Capetian dynasty</i>		Louis-Napoléon Bonaparte	1848-52
Hugh Capet (Hughes Capet)	987-996	<i>Second Empire (emperor)</i>	
Robert II	996-1031	Napoleon III (Louis-Napoléon Bonaparte)	1852-70
Henry I (Henri)	1031-60	<i>Third Republic (presidents)</i>	
Philip I (Philippe)	1060-1108	Adolphe Thiers	1871-73
Louis VI	1108-37	Marie-Edmé-Patrice-Maurice, comte de Mac-Mahon, duc de Magenta	1873-79
Louis VII	1137-80	Jules Grévy	1879-87
Philip II (Philippe)	1180-1223	Sadi Carnot	1887-94
Louis VIII	1223-26	Jean Casimir-Périer	1894-95
Louis IX (Saint Louis)	1226-70	Félix Faure	1895-99
Philip III (Philippe)	1270-85	Émile Loubet	1899-1906
Philip IV (Philippe)	1285-1314	Armand Fallières	1906-13
Louis X	1314-16	Raymond Poincaré	1913-20
John I (Jean)	1316	Paul Deschanel	1920
Philip V (Philippe)	1316-22	Alexandre Millerand	1920-24
Charles IV	1322-28	Gaston Doumergue	1924-31
<i>Valois dynasty</i>		Paul Doumer	1931-32
Philip VI (Philippe)	1328-50	Albert Lebrun	1932-40
John II (Jean)	1350-64	<i>French State (État Français, or Vichy France)</i>	
Charles V	1364-80	Philippe Pétain	1940-44
Charles VI	1380-1422	<i>Provisional government</i>	
Charles VII	1422-61	<i>Fourth Republic (presidents)</i>	
Louis XI	1461-83	Vincent Auriol	1947-54
Charles VIII	1483-98	René Coty	1954-58
<i>Valois dynasty (Orléans branch)</i>		<i>Fifth Republic (presidents)</i>	
Louis XII	1498-1515	Charles de Gaulle	1959-69
<i>Valois dynasty (Angoulême branch)</i>		Georges Pompidou	1969-74
Francis I (François)	1515-47	Valéry Giscard d'Estaing	1974-81
Henry II (Henri)	1547-59	François Mitterrand	1981-95
Francis II (François)	1559-60	Jacques Chirac	1995-
Charles IX	1560-74		
Henry III (Henri)	1574-89		

France, Anatole, pseudonym of JACQUES-ANATOLE-FRANÇOIS THIBAUT, (b. April 16, 1844, Paris, Fr.—d. Oct. 12, 1924, Saint-Cyr-sur-Loire), writer and ironic, skeptical, and urbane critic who was considered in his day the ideal French man of letters. He was elected to

Anatole France
H. Roger-Viollet

the French Academy in 1896 and was awarded the Nobel Prize for Literature in 1921.

The son of a bookseller, he spent most of his life around books. At school he received the foundations of a solid humanist culture and decided to devote his life to literature. His first poems were influenced by the Parnassian revival of classical tradition, and, though scarcely original, they revealed a sensitive stylist who was already cynical about human institutions.

This ideological skepticism appeared in his early stories: *Le Crime de Sylvestre Bonnard* (1881), a novel about a philologist in love with his books and bewildered by everyday life; *La Rôtisserie de la Reine Pédauque* (1893; *At the Sign of the Reine Pédauque*), which discreetly mocks belief in the occult; and *Les Opinions de Jérôme Coignard* (1893), in which an ironic and perspicacious critic examines the great institutions of the state. His personal life underwent considerable turmoil. His marriage in 1877 to Marie-Valérie Guérin de Sauville ended in divorce in 1893. He had met Madame Arman de Caillavet in 1888, and their liaison inspired his novels *Thaïs* (1890), a tale set in Egypt of a courtesan who becomes a saint, and *Le Lys rouge* (1894; *The Red Lily*), a love story set in Florence.

A marked change in France's work first appears in four volumes collected under the title *L'Histoire contemporaine* (1897–1901). The first three volumes—*L'Orme du mail* (1897; *The Elm-Tree on the Mall*), *Le Mannequin d'osier* (1897; *The Wicker Work Woman*), and *L'Anneau d'améthyste* (1899; *The Amethyst Ring*)—depict the intrigues of a provincial town. The last volume, *Monsieur Bergeret à Paris* (1901; *Monsieur Bergeret in Paris*), concerns the participation of the hero, who had formerly held himself aloof from political strife, in the Alfred Dreyfus affair. This work is the story of Anatole France himself, who was diverted from his role of an armchair philosopher and detached observer of life by his commitment to support Dreyfus. After 1900 he introduced his social preoccupations into most of his stories. *Crainquebille* (1903), a comedy in three acts adapted by France from an earlier short story, dramatizes the unjust treatment of a small tradesman and proclaims the hostility toward the bourgeois order that led France eventually to embrace socialism. Toward the end of his life, his sympathies were drawn to communism. However, *Les Dieux ont soif* (1912; *The Gods are Thirsty*) and *L'Île des Pingouins* (1908; *Penguin Island*) show little belief in the ultimate arrival of a fraternal society. World War I reinforced his profound

pessimism and led him to seek refuge from his times in childhood reminiscences. *Le Petit Pierre* (1918; *Little Pierre*) and *La Vie en fleur* (1922; *The Bloom of Life*) complete the cycle started in *Le Livre de mon ami* (1885; *My Friend's Book*).

France has been faulted for the thinness of his plots and for his lack of a vital creative imagination. His works are, however, considered remarkable for their wide-ranging erudition, their wit and irony, their passion for social justice, and their classical clarity, qualities that mark France as an heir to the tradition of Denis Diderot and Voltaire.

France, Banque de, national bank of France, created in 1800 to restore confidence in the French banking system after the financial upheavals of the revolutionary period. Headquarters are in Paris.

The bank listed among its founding shareholders Napoleon Bonaparte, members of his family, and several leading personalities of the time. Founded partly with state funds, but mainly with private capital, the bank was closely connected with the state from the beginning. The French government claimed a participation in the control of the bank through the appointment of the governor and two deputy governors, while the shareholders were represented by a board of 15 regents elected by the 200 largest shareholders.

The bank was initially granted the exclusive privilege to issue bank notes in Paris for a period of 15 years; it was later authorized to establish discount offices in towns where commercial requirements made this necessary, and it was subsequently empowered to exercise its privileges, including the privilege of note issue, in the towns where discount offices were established. Its note-issue privilege was extended to cover the whole of France in 1848 as a result of the transformation of nine provincial banks with note-issuing powers into branches of the bank. In 1946 the bank was nationalized, and its note-issue privilege was extended for an indefinite period.

The bank performs all the normal central banking functions. Formally it shares these functions with the National Credit Council and the Banking Control Commission, but in practice it has primary responsibility for the formulation and implementation of monetary and credit policies and for the orderly functioning of the banking system. The National Credit Council, set up in 1945, is concerned with all matters relating to credit in the French economy. The Banking Control Commission, created in 1941, is responsible for overseeing the application of the regulations and controls of the banking industry.

France, Collège de, state-supported research institution and centre for adult education in Paris. Founded in 1530 by Francis I, it was originally the Collegium Trilinguae (College of Three Languages). It offers lectures by scholars chosen for eminence in their particular fields without reference to academic qualifications. Professorial chairs are not necessarily permanent, and fields of instruction are emphasized somewhat according to the trend of the times. The college does not grant degrees or certificates and requires neither matriculation nor fees. Distinguished lecturers, among others, have been Jules Michelet, Ernest Renan, Henri Bergson, Paul Valéry, and Claude Lévi-Strauss.

France, Reformed Church of: see Reformed Church of France.

France-Soir (French: "Evening France"), daily newspaper published in Paris, one of the city's greatest independent dailies. It was founded as an underground paper during the German occupation of France in World War II, and after the war it emerged as a journal of mass appeal. *France-Soir* has ranked among the country's—and the European con-

tinents—leaders in circulation since its start. The paper has generally attracted readers by stressing sensational news rather than analysis in depth or editorial commentary on political developments. That approach gave it appeal among its basically working-class audience. Aggressive and imaginative in gathering and reporting news, *France-Soir* features lively, eye-catching headlines and numerous pictures. An illustration of its aggressive approach is its acquisition in 1969 of the exclusive right to publish the stories of the U.S. astronauts who were the first to walk on the moon. Like many other French newspapers, *France-Soir* brought members of its editorial staff into a form of partnership after World War II.

Frances of Rome, SAINT, Italian SANTA FRANCESCA ROMANA (b. 1384, Rome [Italy]—d. March 9, 1440, Rome; canonized 1608; feast day March 9), founder of the Oblate Congregation of Tor de' Specchi (Oblates of St. Frances of Rome), a community that, with the Olivetan Benedictines, works for the sick and the poor.

When she was only 13, Frances' parents married her to Lorenzo de' Ponziani, whose sister-in-law, Vannoza, helped Frances draft a rule of life for the new order. In the fierce civil strife caused by the Great Schism of the Western church, the Ponzianis lost their fortune. While living in part of her ruined palace, Frances shared her last resources with the suffering people. With Lorenzo's approval, she founded (1425) the Oblates of Mary, known since 1433 as the Oblate Congregation of Tor de' Specchi. Upon her husband's death in 1436, she became its superior.

Francesca DA RIMINI, original name FRANCESCA DA POLENTA (d. 1283/84, Rimini, Romagna [Italy]), daughter of Guido da Polenta, lord of Ravenna, whose tragic love affair with Paolo Malatesta is renowned in literature and art. Married to Gianciotto Malatesta (called "the Lame") for reasons of state, she was murdered by him when he discovered her in adultery with his brother Paolo (called "the Fair"), whom he also killed.

Dante was the first to make a literary reference to the tragedy; in Canto V of the *Inferno* he encounters the lovers Francesca and Paolo on the second circle. Their love and death have also been celebrated in plays by Silvio Pellico and Gabriele D'Annunzio, in operas by Hermann Götz and Sergey Rachmaninoff, and by many other writers, painters, and composers.

Francesca, Piero della (painter): see Piero della Francesca.

Francescatti, Zino, original name RENÉ-CHARLES FRANCESCATTI (b. Aug. 9, 1902, Marseille, Fr.—d. Sept. 17, 1991, La Ciotat), French virtuoso violinist known for his lyrical performance style and as a champion of contemporary violin music by such composers as Darius Milhaud, Leonard Bernstein, and Karol Szymanowski.

A child prodigy, he studied violin from age three. He made his debut at five, soloed successfully in Beethoven's *Violin Concerto* at 10, and was an established concert artist by his early 20s. From 1928 he toured widely in Europe and South America, making his U.S. debut in 1939 with the New York Philharmonic. Francescatti made many recordings and toured extensively in the United States, Europe, South America, and Israel. After his retirement he established the Zino Francescatti Foundation for young violinists.

Franceschini, Baldassare, also called IL VOLTERRANO (b. 1611, Volterra, republic of Florence [Italy]—d. 1689, Florence), Italian painter of the Baroque era.

At a very early age Franceschini started as an assistant to his father, a sculptor. From 1652 to 1660 he worked on paintings in the cupola of the Niccolini Chapel in Santa Croce, Florence. His work during these years was his most notable. Among his best oil paintings of large scale is the "St. John the Evangelist" in the Church of San Chiara at Volterra. One of his last works was the fresco of the cupola of the Annunziata, Florence, which occupied him for two years about 1683.

Franceschini, Marcantonio (b. 1648, Bologna, Papal States [Italy]—d. 1729, Bologna), Italian painter, a leading artist of the Bolognese school of the Baroque period.

Franceschini worked in Genoa, Modena, and Rome as well as in Bologna and worked extensively for patrons in Austria and Germany. He was made director of the Clementina Academy in Bologna in 1721. Franceschini was the last important representative of the tradition of the Carracci; the works of Lodovico Carracci and Francesco Albani are the main sources of his style. His figures, brushwork, and colouring are unimaginative and unoriginal, but he had a gift for skillfully arranging an elaborate composition and demonstrated considerable talent as a decorator. His paintings in both oils and fresco are numerous, though little known; the most famous frescoes, which were done for the Church of Corpus Domini, Bologna (1687-94), were destroyed during World War II.

Francesco (Italian personal name): *see under* Francis, except as below.

Francesco DI CRISTOFANO: *see* Franciabiagio.

Francesco DI GIORGIO, in full FRANCESCO MAURIZIO DI GIORGIO MARTINI, OF DI MARTINO (baptized Sept. 23, 1439, Siena, republic of Siena [Italy]—d. 1502, Siena), early Italian Renaissance painter, sculptor, architect, and designer.

Remarkably versatile, a kind of Renaissance *homo universale*, Francesco combined the bold investigation of the humanist scholars with the conservative lyricism of the Siennese school. His early works were manuscript illuminations, furniture panels, and two monumental altarpieces: the "Coronation of the Virgin" (1471) and "The Nativity" (1475). "The Nativity" shows that Francesco was greatly influenced by Florentine artists of the period, especially Andrea del Verrocchio.

Francesco is remembered chiefly as an architect and an architectural theorist. He translated Vitruvius and wrote an original work on architecture, *Trattato di architettura civile e militare*, which discusses city planning and military architecture, anticipating some of the architectural theories of the high Renaissance. By 1477 he was in the service of Duke Federico da Montefeltro, in Urbino, where he may have participated in the design and decoration of parts of the palace of Urbino, and built 136 military fortresses. His architectural masterpiece is Santa Maria del Calcinaiolo, Cortona (commissioned 1484), which, however, is now greatly altered. As a sculptor he is best known for four bronze figures for the high altar of Siena Cathedral (1489-97) and for a series of bronze reliefs showing Verrocchio's influence. (They have also been attributed to the young Leonardo da Vinci.) He also designed fortifications, battle machinery, and weapons and is thought to have originated the land mine.

Franceville, town, southeastern Gabon, on the east bank of the Ogooué River, just south of its confluence with the Mpassa. The French explorer Pierre Savorgnan de Brazza founded it in 1880, and until 1946 it was a part of the Middle Congo Colony.

Franceville is now an active trading centre in a mining region. The exploitation of manganese at Mouanda and uranium at Mounana, both to the northwest, has greatly stimulated population growth and commerce in the area. Gold, a less-important export, is mined southwest of the town, and coffee is a major cash crop in the region. Nearby Poubara is the site of a major power installation. Pop. (1987 est.) 75,000.

Franche-Comté, *région* compassing the eastern French *départements* of Jura, Doubs, Haute-Saône, and the Territoire de Belfort. The capital is Besançon. The region has an area of 6,256 square miles (16,202 square km) and is bounded by the *départements* of Ain to the south, Saône-et-Loire, Côte-d'Or, and Haute-Marne to the west, and Vosges and Haut-Rhin to the north. Switzerland lies to the east. Franche-Comté ("Free County") was the name given in the 12th century to the county of Burgundy. After the new kingdom of Burgundy emerged in 888, its kings secured very little control over the local counts in Cisjurane Burgundy; and, even after the kingdom of Burgundy passed to the Holy Roman emperor Conrad II in 1032, the control was intermittent or haphazard. Finally in 1127 a local count, Raynald III, refused to do homage to the German king Lothair II (later Holy Roman emperor). Lothair tried to set up a rival in Raynald's place, but, after 10 years of conflict, Raynald was victorious. Thereafter, he was the *franc-comte* ("free count"; German: *Freigraf*), and his territory became known as the Franche-Comté.

The succeeding two centuries were years of repeated female succession and dynastic changes. Finally, in 1384, the heiress Margaret of Flanders brought the countship to Philip II the Bold, duke of Burgundy, to whom she had been married in 1369. After the death of Charles the Bold in 1477, his heiress, Mary, married the Austrian archduke Maximilian I of Habsburg (later Holy Roman emperor). The Treaty of Arras (1482), however, ceded Franche-Comté to the dauphin of France on his betrothal to Mary's daughter Margaret of Austria. When the dauphin became King Charles VIII, he broke this engagement and had to retrocede Franche-Comté to Austria (Treaty of Senlis, 1493). For the next 185 years, Franche-Comté was a Habsburg possession.

Franche-Comté passed to the Spanish Habsburgs with the rest of the Burgundian inheritance through Charles V's partition of his dominions. Under Philip II of Spain, a forceful repression of the Protestants took place, and Henry IV of France, in his war against Philip, violated Franche-Comté's neutrality. From 1598 to 1635 peace was maintained. The fact, however, that the country was a geographic link in the Spanish Habsburgs' encirclement of France made the French want to annex it. In Louis XIII's war against Spain, it was invaded and ravaged annually from 1636 to 1639, but in 1648, though the Franco-Spanish war went on, Franche-Comté, as a fief of the Holy Roman Empire held by Spain, was included in the Peace of Westphalia.

Conquered in 1668 by the Great Condé in the War of Devolution but retroceded to Spain by the Peace of Aix-la-Chapelle (Aachen), Franche-Comté was finally conquered for France by Condé in 1674, in the last of the so-called Dutch Wars. The annexation was recognized by the Peace of Nijmegen (1678), and it was made a French province.

The Franc-Comtois had violently opposed the French invaders, and pro-Spanish feeling lasted until the 18th century. In 1790, along with the rest of France, Franche-Comté was broken up into *départements*.

Franche-Comté is dominated by the Jura Mountains. The basin of the upper Saône River extends into Jura. Annual precipitation

is high, and forests cover much of Franche-Comté.

The region is sparsely populated. The population decreased by more than 16 percent between 1872 and 1946, as it did in much of rural France during that period, but has subsequently grown. Demographic recovery has favoured Doubs and the Territoire de Belfort over Jura and Haute-Saône, whose rural population has been depleted by emigration. Much of the population is concentrated in the agglomeration of Besançon-Montbéliard-Belfort. Many factory workers continue to live in the villages and commute to work.

Animal husbandry in Franche-Comté centres on the mountains and dominates agriculture. The region is a leading producer of milk and cheese. Fruits are grown in the lowlands. Forestry remains an economically important industry. Other industries are highly developed as well and are concentrated along the Doubs River. Clocks and watches are manufactured in Besançon; the Peugeot automobile company has factories in Vesoul and Montbéliard. Other manufactures include textiles, chemicals, and woodwork. Saint-Claude in Jura produces fine pipes and polishes diamonds. Salt is mined in Jura around Salins-les-Bains and Montmorot. Highways and railways are concentrated in the valley of the Doubs River. Pop. (1990) 1,097,276.

Franchet d'Esperey, Louis-Félix-François (b. May 25, 1856, Mostaganem, Alg.—d. July 8, 1942, Albi, Fr.), marshal of France and one of the most effective French military leaders of World War I. He was responsible for driving Bulgaria out of the war, thereby opening the road to Vienna for the Allies.

Trained at Saint-Cyr, d'Esperey served during the prewar period in Algeria and Tunisia. At the outbreak of World War I, he was a corps commander at Lille. His successful leadership resulted in his being promoted to command the eastern army group (March 1916) and later the northern army group (January 1917). But after a defeat by the Germans on the Chemin des Dames (a road between the Aisne and Ailette rivers in the Aisne district of northern France) in May 1918, d'Esperey was sent to command the polyglot Allied armies in Macedonia. There he achieved the decisive victory (Sept. 15-29, 1918) that forced Bulgaria out of the war. He then led a bold thrust to the Danube, resulting in the collapse of demoralized German divisions hurriedly sent back from Russia and the surrender of Hungary. He was created a marshal of France in 1921 and was elected to the French Academy in 1934.

Francia, original name FRANCESCO DI MARCO DI GIACOMO RAIOLINI (b. 1450, Bologna [Italy]—d. Jan. 5, 1517/18, Bologna), Italian Renaissance artist and the major Bolognese painter of the late 15th century. He was much influenced by such Ferrarese painters as Lorenzo Costa, Francesco del Cossa, and Ercole de' Roberti, but his later works clearly show the influence of the Umbrians, Perugino, and Raphael. Francia's mature style is seen in such works as his "Assumption" (1504) with its gentle landscape filled with picturesque rock formations and delicate trees in the Umbrian manner and elongated figures that recall those of Costa. Although a large number of repetitive Madonnas were produced in his workshop—e.g., "The Madonna and Child and Two Angels" (Alte Pinakothek, Munich)—a few portraits, such as the "Portrait of Federico Gonzaga as a Boy" (1510; Metropolitan Museum

"Assumption" (lost in war), oil on wood by Francia, c. 1504; formerly in the Staatliche Museen, Berlin

By courtesy of the Staatliche Museen zu Berlin

of Art, New York City), reveal his most personal style, which has been called excessively refined.

Francia, José Gaspar Rodríguez de (b. Jan. 6, 1766, Asunción, Río de la Plata—d. Sept. 20, 1840, Asunción, Paraguay), dictator of Paraguay whose intensely personal rule and policy of self-sufficiency left the nation both isolated and without alternative political institutions.

Francia was trained in theology but turned to the practice of law. In 1811 he became secretary to the junta that had overthrown Spanish rule and in 1813 served as co-ruler. The next year he was elected dictator, and in 1816 he obtained the dictatorship for life.

Not content with freedom from Spain, Francia in 1813 declared independence from Argentina, though Paraguay's only tie to the outer world lay on the river route through Buenos Aires. Determined to keep his country independent, Francia forbade all river traffic to Argentina and banned all foreign commerce. Paraguay thus became a hermit nation; few people were permitted to enter or leave.

Francia, or "El Supremo," controlled the national revenues; fostered internal industries to make the nation self-sufficient; introduced modern methods of farming and livestock raising; and organized and equipped the army. He abolished the Inquisition, suppressed the college of theology, swept away tithes, and deprived the aristocracy of their privileges.

Francia was a frugal and honest ruler but unspeakably cruel. The nation survived at a primitive level of self-sufficiency but at a terrible cost in political liberty.

Franciabigio, also called FRANCESCO DI CRISTOFANO, FRANCESCO GIUDINI, or GIUDICI (b. 1482/83, Florence?—d. 1525, Florence), Italian Renaissance painter, best known for his portraits and religious paintings, whose style included early Renaissance, High Renaissance, and Proto-Mannerist elements. His early style is filled with movement and attention to descriptive detail, strongly reminiscent of 15th-century Italian painting. Later, he was attracted to the Florentine works of Raphael, as can be seen in his "Madonna del Pozzo" (c. 1508; Accademia, Florence). In the atrium of SS. Annunziata in Florence he painted the "Marriage of the Virgin" (1513) as a portion of a series in which Andrea del Sarto, a leading Florentine painter, was chiefly concerned. When the friars uncovered this work before it was quite finished, Franciabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin and some

other heads, and the fresco, which would otherwise be his masterpiece in that method, was mutilated.

For a number of years, Franciabigio maintained a studio with Andrea del Sarto. Together with Andrea's student, Pontormo, they decorated the Medici villa at Poggio a Caiano, where Franciabigio's "Triumph of Cicero" displays his talent for narrative painting. Andrea's influence on Franciabigio may be seen in the dark, smoky background and the soft, dramatic lighting of the "St. Job Altar" (1516, Uffizi, Florence).

Francien dialect, Old French dialect from which modern standard French was derived. Originally the language of the Île-de-France region, of which Paris was a part, Francien became the national language of France as a consequence of the political and intellectual importance assumed by Paris in the 13th and 14th centuries. See French language.

BRITTANY

● **Francis I** (b. May 11, 1414, Vannes, Fr.—d. July 19, 1450), duke of Brittany (from 1442), son of John V (or VI). He had his brother Gilles thrown into prison and put to death for allegedly spying for the English, with whom he warred (1449–50). The king of France intervened and expelled the English from Normandy.

● **Francis II** (b. June 23, 1435—d. Sept. 9, 1488, Couëron, Brittany), duke of Brittany from 1458, who succeeded his uncle, Arthur III; he maintained a lifelong policy of Breton independence in the face of encroachments by the French crown. The problems of Breton independence were magnified by the fact that Francis had no sons; the fate of his Breton

Francis II, detail of a sculpture from his tomb by Michel Colombe (1430–c. 1512)

lands would depend on the terms of the marriages he secured for his daughters.

Francis joined the League of the Public Weal against King Louis XI of France in 1465, invaded Normandy in 1467 on behalf of the dispossessed Charles de France (Louis XI's brother), and allied himself with King Edward IV of England in 1468. Forced to sign the Treaty of Ancenis with France (1468), he allied himself again with Edward in 1475, but once more had to come to terms with France. When Louis XI bought the House of Penthièvre's rights to the duchy of Brittany (1480),

Francis in 1481 made yet another treaty with Edward, whereby his eldest daughter, Anne (later queen consort of France), was to marry the Prince of Wales.

When Francis' chief counsellor, Pierre Landais, provoked the hatred of the Breton nobles by his persecution of the chancellor Guillaume Chauvin, the nobles, with the support of Anne of Beaujeu, regent of France, had Landais hanged (1485). When Anne sent French troops into Brittany, however, the nobles rallied to the Duke's side. Defeated in 1488, Francis was forced to sign the Treaty of Le Verger, in which he undertook to contract marriages for his daughters Anne and Isabelle only with the French king's permission, thereby relieving France of the danger that Brittany might fall to some foreign power.

FRANCE

● **Francis I**, also called (until 1515) FRANCIS OF ANGOULÊME, French FRANÇOIS D'ANGOULÊME (b. Sept. 12, 1494, Cognac, Fr.—d. March 31, 1547, Rambouillet), king of France (1515–47), the first of five monarchs

Francis I, portrait by Pierre Dumonstier, after a drawing by Jean Clouet; in the Bibliothèque Nationale, Paris

By courtesy of the Bibliothèque Nationale, Paris

of the Angoulême branch of the House of Valois. A Renaissance patron of the arts and scholarship, a humanist, and a knightly king, he waged campaigns in Italy (1515–16) and fought a series of wars with the Holy Roman Empire (1521–44).

Early years. Francis was the son of Charles de Valois-Orléans, comte d'Angoulême, and Louise of Savoy. On the accession of his cousin Louis XII in 1498, Francis became heir presumptive and was given the Duchy of Valois. With his sister Marguerite, he was raised by his mother, who had been widowed at the age of 20 and whom he deeply revered; he knelt whenever he spoke to her. No one had as much power over him as these two women. Idolized, he grew up following his own whims, without discipline and more infatuated with chivalrous romances, songs, and violent exercise than with classical studies. He was greatly admired by the gay, young circle of his mother's cultured court for his athletic build and the elegance of his demeanour and manners. His need for female companions stemmed from this upbringing, as did his lack of realism and his chivalrous imagination.

Louis XII, distrustful of Francis, did not allow him to dabble in affairs of state but sent him off at the age of 18 to the frontiers, which had been attacked in force. There, Francis learned more about warfare and, being of a sensual nature, about the licentiousness of camp life than about how to govern the state or, even more, to govern himself. Shortly before his death, Louis XII married him to

Claude, his 15-year-old daughter. On Jan. 1, 1515, at the age of 20, Francis became king of France.

His quick and shrewd mind, his amazing memory, and his universal curiosity compensated for his inexperience. But, because he was outgoing and trusting and incapable of dissembling, he was always a bad politician. The pomp of the Reims coronation, the sumptuous cortege of the solemn entry into Paris, and the lavish feasts revealed his love of ceremony and also pleased the people of Paris, who had been disheartened by a long succession of morose and sickly sovereigns.

Promise of a great reign. Louis XII had left an army prepared to reconquer the Duchy of Milan. This ill-fated dream of recovering his great-grandmother Valentina Visconti's heritage—which had been lost, retaken, then lost again—fascinated Francis in his turn. Ambitious for glory and urged on by turbulent young nobles, he made sure of peace with his neighbours, entrusted the regency to his mother, and galloped off to Italy.

At the bloody Battle of Marignano, charging at the head of his cavalry, he defeated the reportedly invincible Swiss mercenaries of Duke Massimiliano Sforza and his ally Pope Leo X. After the victory, by his own wish, he was knighted by the captain who had fought most bravely: Bayard, the most famous chevalier of his time.

The Pope received his conqueror in Bologna. Surrounded by his glittering pontifical court and by his famous artists, he dazzled Francis with concerts, banquets, and theatrical performances. The Pope offered him a Madonna by Raphael and negotiated a concordat that returned to the Pope the benefices of the rich church of France, while the nomination of prelates was assigned to the King, who was desirous of strengthening his authority over a clergy grown too acquisitive and independent.

Buoyed up by a victor's prestige, the King spoke as a sovereign, using for the first time the formula of absolute power: "For such is our pleasure." Prosperity permitted him to grant a princely pension to Sforza, as well as to Leonardo da Vinci and other artists who brought masterpieces to his court. He also signed a perpetual peace treaty with the Swiss and bought back Tournai from Henry VIII of England. And, as a pledge of unalterable friendship, the first-born royal child, Princess Louise, was affianced to the Habsburg prince Charles, heir to the Netherlands and, at 16, the new king of Spain.

Everything forecast a great reign. Francis I formed a brilliant and scholarly court at which poets, musicians, and learned men mingled with rough noblemen from the provinces whom idleness was making dangerous. He welcomed lovely ladies at court, saying, "A court without women is a year without spring and a spring without roses." The arts, elegance, and chivalrous gallantry served to refine the licentious manners of the court.

The frail queen Claude, gentle and pious, bore a child each year. Francis respected her and sought her advice. In the meantime, he loved the dark-haired comtesse de Châteaubriant, without, however, foregoing nocturnal escapades with his childhood companions, who had now become his ministers and his favourites.

Francis toured France tirelessly, showing himself to people who had never seen a king. He was constantly travelling on horseback, winter and summer, whether well or ill. He became familiar with everything: men, roads, rivers, resources, and needs. During his travels, he emptied prisons, curtailed the abuses of judicial powers by the nobles, lavished largesse on the people, and provided games and processions for them, speaking to them in

his grand manner, warmly and openly: "My friends, my beloved ones . . ."

Popular, happy, the father of two sons, he was the most powerful sovereign in all Christendom when, in 1519, the German emperor Maximilian died. The election as emperor of Maximilian's grandson Charles spelled ruin for Francis I, for Charles, who was already king of Spain, now encircled France with his possessions.

Rivalry with Charles V. Nineteen years old, secretive, cool-headed, and a clever politician, the Emperor had his mind set on a universal monarchy. His chief obstacle was the King of France. A mortal hatred emerged from this rivalry, leading to 27 years of savage warfare, interrupted by truces that were invariably violated. In 1520, on the Field of Cloth of Gold near Calais, where both displayed unprecedented magnificence, Francis vainly sought an alliance with Henry VIII.

Hostilities between Charles V and France began in 1521 in the north and in the Pyrenees, while the two brothers of the King's mistress were losing Milan. The soldiers remained unpaid, and the army was disintegrating. The King, unconcerned, arose late, paid little attention to his council, and gave orders without seeing that they were carried out. Money disappeared into thin air. A few paymasters were hanged, though in vain.

In 1523 the King demanded the return to the French state, according to law, of the vast provinces that the great feudal duke Charles de Bourbon thought he had inherited from his wife. Incensed, Bourbon turned traitor and joined the Emperor's service, claiming that the French, weary of the prodigality of their sovereign, would rise up on an appeal from him. Commanding the imperial army, he invaded Provence, was driven back near Marseille, and withdrew toward Italy. Francis I was pursuing him when he learned of the death of his wife Claude, at the age of 24, exhausted from seven pregnancies. The death of his second daughter followed soon after. Meanwhile, the English and the Germans were advancing in the north. In vain, his mother begged him to return: "Our good angel has abandoned us. Your horoscope forecasts disaster!" At the Battle of Pavia in 1525, defeated and wounded, he was taken prisoner. "Madame, to inform you of the rest of my misfortune, I have nothing left to me save my honour and my life."

As the price for the King's freedom, the Emperor demanded one-third of France, the renunciation of France's claim to Italy, and restitution to Bourbon of his fiefs, with the addition of Provence. "I am resolved to endure prison for as long as God wills rather than accept terms injurious to my kingdom!" replied the King.

Imprisoned in a dismal tower in Madrid, the recluse composed melancholy poems, songs, and letters to his subjects, heartrending in their humility and their tender nobility. The mortifying defeat, the dangerous situation of his country, and the confinement aggravated his habitual migraines, the consequence of old wounds and of newly contracted syphilis. When he was struck down by an abscess in his head, his people, loyal in bad fortune as in good, prayed for him. The Archbishop of Tournon said a mass at his bedside, in the presence of his sister Marguerite, who had hastened to Madrid.

Decline and death. Although Francis finally recovered, he did not cease to suffer. His personality changed. Sudden reversals of mood, excesses of severity and clemency, inconsistencies in his statesmanship and in his personal behaviour marked him; his mind sometimes wandered.

The Emperor persisted in his exorbitant claims. Resigned to die in prison, the King abdicated in favour of his eldest son. France judged this abdication to be the worst possi-

ble move. The Dauphin was too young; the country was lost without its leader. No matter what the cost, he would have to return home. The French ambassadors, with nominal co-operation by the King, concluded the harsh Treaty of Madrid. He signed it in January 1526, declaring that the word and signature of an imprisoned knight were valueless and that it was beyond his power to dismember his kingdom. Still bedridden, he was betrothed by proxy to Eleanor, widow of the King of Portugal and sister of his jailer. The wedding was to seal the reconciliation of the two rulers and was to follow execution of the treaty. As a last condition, Francis had to deliver his two eldest sons, seven and eight years old, as hostages.

The surrendered provinces refused to divorce themselves from France. The Emperor, furious with the perjured King, held the children prisoner for four years. His army plundered Italy and captured Pope Clement VII. Francis could not openly engage in the war that was again flaring up everywhere against Charles V. Doomed to disavow his promises to his secret allies, he fled from their envoys, either going on hunting trips from forest to forest or travelling around the country, building fairy-like castles that he occupied only fleetingly and founding the free and secular Collège de France. Anne, duchesse d'Étampes, "the most beautiful of learned ladies, and the most learned of beautiful ladies," replaced Madame de Châteaubriant, more as a companion than mistress.

His raging hatred impelled Charles and Francis to challenge each other to a duel, which was, however, prevented. During one of the King's relapses, his mother reached an agreement with Margaret of Austria, the Emperor's aunt, to stop this deadly struggle. The ensuing Treaty of Cambrai softened that of Madrid. In order to get his children back, Francis had to abandon his allies, give up Italy, and pay 2,000,000 gold crowns. His foolish expenditures had emptied the treasury, and the ransom was collected only with difficulty. Finally, however, the little princes were able to attend their father's political marriage to Eleanor in 1530.

In 1531 the King's mother succumbed to the plague. Marguerite, having married the King of Navarre, lived at some distance. The King, grown tragically old, in 1533 presided over the marriage of his second son, Henry, to Catherine de Médicis, the niece of Clement VII.

When religious strife broke out in France, the King—tolerant, an epicurean, an admirer of the Dutch Humanist Erasmus, and patron of the great satirist Rabelais, as well as a reader of Philipp Melancthon, the Reformer—tried to moderate the growing fanaticism. Both his sister and his mistress supported the Reformation, whereas his ministers were zealous Catholics. But the Reformers were considered republicans, and the burnings at the stake began. For five years he delayed the extermination of the Waldensian sect, only signing the order without reading it when on his deathbed.

The war with Charles V was resumed in 1536. Bereavements within the family came in quick succession. The Dauphin died at the age of 18—poisoned by Charles V, it was believed. The third son, the most dearly loved, died of the plague. One of Francis' last diplomatic achievements was an alliance with the Turks against the Emperor.

Henry VIII, by turns friend or enemy, died in January 1547. Francis, younger by two years, still had time to found the port of Le Havre, to send Jacques Cartier to Canada, to reform the judicial system, and to decree the use of French in all legal documents.

Wasting away with fever, dying, he wandered from castle to castle, carried on a litter. Finally, on March 31, 1547, the knight-king died. Notwithstanding the personal afflictions of the last 20 years of his life, Francis was to

his countrymen and to the succeeding generation *le grand roi François*. (M.Vi.)

• **Francis II** (b. Jan. 19, 1544, Fontainebleau, Fr.—d. Dec. 5, 1560, Orléans), king of France from 1559, who was dominated throughout his reign by the powerful Guise family.

Francis II, enamel by L. Limosin, c. 1560; in the Louvre, Paris

Cliche Musees Nationaux

The eldest son of Henry II and Catherine de Médicis, Francis was married in April 1558 to Mary Stuart, queen of Scots and niece of François, duc de Guise, and of Charles, cardinal of Lorraine. A sickly and weak-willed young man, Francis became a tool of the Guises, who saw an opportunity for power and a chance to break the Huguenot strength within the kingdom. To defeat the Guises, Louis de Bourbon, prince de Condé and Huguenot leader, planned the conspiracy of Amboise (March 1560), an abortive coup d'état in which some Huguenots surrounded the Château of Amboise and tried to seize the King. The conspiracy was savagely put down, and its failure strengthened the power of the Guises. This in turn frightened Francis' mother, Catherine, who then tried to balance the situation by securing the appointment of the moderate Michel de L'Hospital as chancellor.

In the hopes of gaining peace and rehabilitating court finances, the States General was summoned, but Francis died soon after the session began at Orléans. His death temporarily ended the Guises' dominion and saved Condé, who had been sentenced to death for high treason. Francis was succeeded by his brother, Charles IX.

GERMANY/HOLY ROMAN EMPIRE

• **Francis I** (b. Dec. 8, 1708, Nancy, Duchy of Lorraine—d. Aug. 18, 1765, Innsbruck, Austria), Holy Roman emperor from Sept. 13, 1745; he was duke of Lorraine (as Francis Stephen) from 1729 to 1735 and grand duke

of Tuscany from 1737. Although nominally outranking his wife, Maria Theresa, archduchess of Austria and queen of Hungary and Bohemia, the capable but easygoing Francis always was overshadowed by her strong personality.

From 1723 Francis, whose dynasty in Lorraine was closely connected with the Austrian Habsburgs, lived at the Viennese court of the Holy Roman emperor Charles VI. His marriage to Maria Theresa, who was Charles's heiress, took place on Feb. 12, 1736. Charles consented to it only on condition that Francis make the sacrifice required by the French in order to end the War of the Polish Succession, namely, the cession of Lorraine to Stanisław Leszczyński (Stanislaw I), for whom the French had failed to secure Poland. In compensation, Francis was allowed to succeed the childless Gian Gastone, last of the Medici grand dukes of Tuscany. These arrangements were confirmed by the 1738 Treaty of Vienna.

When Maria Theresa succeeded Charles VI (Oct. 20, 1740), she immediately appointed her husband coregent. During the War of the Austrian Succession (1740–48), Maria Theresa, apprehensive for Francis' life, refused his repeated demands to be allowed to defend her inheritance by leading the Austrian Army. During the war he was elected Holy Roman emperor after the death of the emperor Charles VII (the elector Charles Albert of Bavaria), who was one of his wife's chief adversaries. The influence of Francis in government was inconsiderable except in economic matters. He is better remembered for his cultural interests. Maria Theresa mourned his death throughout the 15 years by which she survived him.

• **Francis II** (b. Feb. 12, 1768, Florence—d. March 2, 1835, Vienna), the last Holy Roman emperor (1792–1806) and, as Francis I, emperor of Austria (1804–35); he was also, as Francis, king of Hungary (1792–1830) and king of Bohemia (1792–1836). He supported the conservative political system of Metternich in Germany and Europe after the Congress of Vienna (1815).

Son of the future emperor Leopold II and Maria Luisa of Spain, Francis received his political education from his uncle, Emperor Joseph II, who disliked his nephew's unimaginative outlook and stubbornness but praised his application and sense of duty and justice. Ascending to the throne on the death of his father in 1792, Francis inherited the problems

Francis II, detail from an oil painting by Josef Kreutzinger, 1815

By courtesy of the Bild-Archiv Österreichische Nationalbibliothek Vienna

raised by the French Revolution. An absolutist who hated constitutionalism in any form, he supported Austria's first coalition war against France (1792–97), sometimes taking the field himself, until forced to accept the Treaty of Campo Formio (1797), by which the empire lost Lombardy and the left bank of the Rhine. Again defeated by France (1799–1801), he elevated Austria to the status of an empire (1804) soon after Napoleon had made himself emperor of the French. After Austria took

the field against Napoleon for the third time in 1805 and was again defeated, Napoleon dictated the dissolution of the Holy Roman Empire; Francis abdicated his title in 1806.

Thus, the ancien régime that had come to an end in France in 1789 ended in Germany also. The year 1809 saw Austria's fourth unsuccessful war against Napoleon, during which Francis, always distrustful of revolutionary or even popular movements, abandoned pro-Habsburg Tirolese rebels to France and Bavaria. Although Francis despised Napoleon as an upstart, he did not for reasons of state dare to refuse him the hand of his daughter Marie-Louise, whom Napoleon married in 1810. Francis himself was present at many of the battles of 1813–14, which finally destroyed the French emperor's power. After the Congress of Vienna (1815), Francis supported his chief minister, Metternich, in the conservative and restrictive policies that became known as the Metternich system. Repressing liberalism and reinstating much of the power of the Roman Catholic Church lost under Joseph II, Francis was nevertheless a patron of the arts and sciences and he did not hesitate to introduce innovations, such as steamships on the Danube, or to show an interest in the development of railroads.

Kaiser Franz, by Victor Bibl, appeared in 1938.

HUNGARY

• **Francis**: see Francis II (Germany/Holy Roman Empire).

TUSCANY

• **Francis (I)**, original name FRANCESCO DE' MEDICI (b. March 25, 1541, Florence—d. Oct. 19/20, 1587, Poggio a Caiano, near Florence), second grand duke (*granduca*) of Tuscany, a tool of the Habsburgs and father of Marie de Médicis, wife of Henry IV of France.

He was appointed head of government in 1564 while his father, Cosimo I, was still alive; and he succeeded his father as grand duke in 1574. The title was not precisely legitimate since it had been bestowed by the pope (1569), but Francis obtained the grand ducal title from the emperor Maximilian II in November 1575. By subservience to the Habsburgs he won recognition of his dynasty's hereditary right to all his possessions in Tuscany; and he twice refused invitations to stand as a candidate for the Polish crown (1575 and 1587). He sponsored Bernardo Buontalenti's plan for developing Livorno (1577), which was to make it the greatest Tuscan port; he strengthened the fleet; and he opened several trading posts in the eastern Mediterranean.

A scholar and a keen student of chemistry, mechanics, and ballistics, Francis also continued his family's patronage of artists (notably Giovanni da Bologna) and was the first to house the Medici collection of paintings in the Uffizi Palace in Florence. His reign was tarnished, however, by domestic scandals: his brother Pietro murdered his own wife, the younger Eleanor de Toledo (night of July 9–10, 1576); his sister Isabella was murdered by her husband Paolo Giordano Orsini, duca di Bracciano (July 10, 1576); and Francis himself largely lives on in the romantic popular memory because of his love affair with Bianca Cappello. While he was still heir presumptive, he had taken this young patrician as his mistress—after she had been abandoned by the lover with whom she had fled from Venice. Nothing could ever deflect Francis from this passion—neither the marriage with Joanna of Austria, nor the reproaches of his family and of the Emperor, nor public censure. When Joanna died, after giving him three children, he married Bianca and had her solemnly

crowned in the Palazzo Vecchio. They died of malaria within a few hours of each other in 1587. Popular imagination, however, refused to believe this clinical account of their deaths. It was said that Bianca had prepared a poisoned tart intended for her brother-in-law Ferdinando (the future Ferdinand I), that Francis had eaten some of it by mistake, and that Bianca in desperation then ate some herself in order not to survive her lover and husband.

TWO SICILIES

• **Francis I** (b. Aug. 14, 1777, Naples—d. Nov. 8, 1830, Naples), king of the Two Sicilies from 1825.

The son of Ferdinand I and Maria Carolina, Francis at first inclined toward liberalism. After the introduction of the constitution of 1812, which provided for a bicameral government along British lines, he was appointed *vicario*, or regent, of Naples. Francis sympathized with the Carbonari uprising of 1820; he opposed the decision of the Congress of Laibach (1821) to send Austrian troops to restore the absolutist monarchy in the Kingdom of the Two Sicilies. After witnessing the success of the reactionary forces in Naples, however, his outlook changed. After succeeding to the throne upon his father's death (Jan. 4, 1825), he disavowed his previous liberalism, becoming even more reactionary than his father. He disbanded the National Guard, requested an extension of Austrian garrisoning in the kingdom until 1827, and savagely repressed, with the aid of Guglielmo del Carretto, a revolutionary outbreak in Cilento (1828).

Where the same name may denote a person, place, or thing, the articles will be found in that order

• **Francis II** (b. Jan. 16, 1836, Naples—d. Dec. 27, 1894, Arco, Italy), king of the Two Sicilies from 1859 until his deposition in 1860, the last of the Bourbons of Naples.

He was the only son of Ferdinand II by his first consort, Maria Cristina of Savoy. Timid and suspicious, he was easily overruled in state and family councils. Upon his accession he rejected proposals made by Count Cavour that he should join Piedmont-Sardinia in the war against Austria and grant liberal reforms on its conclusion. Thoroughly alarmed by the invasion (May 1860) of Sicily by Giuseppe Garibaldi and the Thousand, Francis, acting on the advice of the French emperor Napoleon III, capitulated to the liberals in his kingdom (June 25, 1860); he restored the constitution of 1848, granted freedom of the press, and promised fresh elections. It was too late to save the monarchy, however, and on October 1–2 the Bourbon forces were defeated by Garibaldi on the Volturno River. Francis was deposed by the plebiscite of October 21–22, and on the fall of Gaeta (Feb. 13, 1861) to the Piedmontese he retired to Rome as the guest of Pope Pius IX. When Rome also fell (1870), he settled in Paris.

Francis OF ASSISI, SAINT, ITALIAN SAN FRANCESCO D'ASSISI, baptized GIOVANNI, re-named FRANCESCO, original name FRANCESCO DI PIETRO DI BERNARDONE (b. 1181/82, Assisi, Duchy of Spoleto—d. Oct. 3, 1226, Assisi; canonized July 15, 1228; feast day October 4),

founder of the Franciscan orders of men and women and leader of the church reform movements of the early 13th century. His fraternal charity, consecration to poverty, and dynamic

Saint Francis of Assisi, detail of a fresco by Cimabue, late 13th century; in the lower church of S. Francesco, Assisi, Italy

Alinari—Anderson from Art Resource

leadership drew thousands of followers and made him one of the most venerated religious figures. He is (with Catherine of Siena) the principal patron saint of Italy.

Early life and career. Francis was the son of Pietro di Bernardone, a cloth merchant, and the lady Pica. Nothing certain is known of the family background. At Francis' birth, his father was away on a business journey to France, and his mother had him baptized Giovanni. On his return, Pietro di Bernardone changed the infant's name to Francesco; thus his full name was Francesco di Pietro di Bernardone. Francis learned to read and write Latin at the school near the church of S. Giorgio and later acquired some knowledge of the French language and literature, especially of the troubadours. He liked to speak French, although he never did so perfectly, and even attempted to sing in it. His youth does not seem to have been marked by serious moral lapses; nevertheless, an exuberant love of life and a general spirit of worldliness made him a recognized leader of the young men of the town.

In 1202 he took part in a war between Assisi and Perugia, was held prisoner for almost a year, and on his release fell seriously ill. After his recovery, he attempted to join the papal forces under Count Gentile against Frederick II in Apulia in late 1205; at Spoleto, however, he had a vision or dream that bade him return to Assisi and await a call to a new kind of knighthood. On his return, he began to give himself to solitude and prayer so that he might know the will of God for him.

Several other episodes make up what is called his conversion: a vision of Christ while he prayed in a grotto near Assisi; an experience of poverty during a pilgrimage to Rome, where, in rags, he mingled with the beggars before St. Peter's Basilica and begged alms; an incident in which he not only gave alms to a leper (he had always felt a deep repugnance for lepers) but also kissed his hand. One day at the ruined chapel of S. Damiano outside the gate of Assisi, he heard the crucifix above the altar command him: "Go, Francis, and repair my house which, as you see, is well-nigh in ruins." Taking this literally, he hurried home, gathered much of the cloth in his father's shop, and rode off to the nearby town of Foligno, where he sold both cloth and horse. He then

tried to give the money to the priest at S. Damiano. Angered, his father first kept him at home and later brought him before the civil authorities. When Francis refused to answer the summons, his father called him before the Bishop. Before any accusations were made, Francis, "without a word peeled off his garments even down to his breeches and restored them to his father." Covered only by a hair shirt, he said: "Until now I have called you my father on earth. But henceforth I can truly say: Our Father who art in heaven." The astonished bishop gave him a cloak, and Francis went off to the woods of Mt. Subasio above the city.

Francis had renounced material goods and family ties to embrace a life of poverty. He repaired the church of S. Damiano, restored a chapel dedicated to St. Peter the Apostle and then restored the now-famous little chapel of St. Mary of the Angels (Sta. Maria degli Angeli), the Porziuncola, on the plain below Assisi. There, on the feast of St. Matthias, Feb. 24, 1208, he listened at mass to the Gospel account of the mission of Christ to the Apostles: "Take no gold, nor silver, nor money in your belts, no bag for your journey, nor two tunics, nor sandals, nor a staff; for the labourer deserves his food. And whatever town or villa you enter, find out who is worthy in it, and stay with him until you depart" (Gospel According to Matthew 10:9–11).

The Franciscan rule of life. Although he was a layman, Francis began to preach to the townspeople. Disciples were attracted to him, and he composed a simple rule of life for them. In 1209, when the group of friars (as the mendicant disciples were called) numbered 12, they went to Rome to seek the approval of Pope Innocent III, who, although hesitant at first, gave his oral approbation to their rule of life. This event, which according to tradition occurred on April 16, marked the official founding of the Franciscan order. The friars, who were actually street preachers with no possessions of any kind and with only the Porziuncola as a centre, preached and worked first in Umbria and then, as their numbers grew, in the rest of Italy.

The early Franciscan rule of life, which has not survived, set as the aim of the new life, "To follow the teachings of our Lord Jesus Christ and to walk in his footsteps." Probably no one in history has ever set himself so seriously as did Francis to imitate the life of Christ and to carry out so literally Christ's work in Christ's own way. This is the key to the character and spirit of St. Francis. To neglect this point is to show an unbalanced portrait of the saint as a lover of nature, a social worker, an itinerant preacher, and a lover of poverty.

Certainly the love of poverty is part of his spirit, and his contemporaries celebrated poverty either as his "lady," in the allegorical *Sacrum Commercium* (Eng. trans., *Francis and His Lady Poverty*, 1964), or as his "bride," in the fresco of Giotto in the lower church of S. Francesco at Assisi. It was not, however, mere external poverty he sought but the total denial of self (as in Letter of Paul to the Philippians 2:7).

He considered all nature as the mirror of God and as so many steps to God. He called all creatures his "brothers" and "sisters," and in his "Canticle of the Creatures" (less properly called by such names as the "Praises of Creatures" or the "Canticle of the Sun") he referred to "Brother Sun" and "Sister Moon," the wind and water, and even "Sister Death." His long and painful illnesses were nicknamed his sisters, and he begged pardon of "Brother Ass the body" for having unduly burdened him with his penances. Above all, his deep sense of brotherhood under God embraced his fellow men, for "he considered himself no friend of Christ if he did not cherish those for whom Christ died."

In 1212 Francis began a second order for

women that became known as the Poor Clares. He gave a religious habit, or dress, similar to his own to a noble lady of Assisi, later known as St. Clare (Clara) of Assisi, and then lodged her and a few companions in the church of S. Damiano, where she was joined by women of Assisi. For those who could not leave their families and homes he eventually (c. 1221) formed the Third Order of Brothers and Sisters of Penance, a lay fraternity that, without withdrawing from the world or taking religious vows, would carry out the principles of Franciscan life. As the friars became more numerous, the order extended outside Italy.

Probably in the late spring of 1212 Francis had set out for the Holy Land but was shipwrecked on the east coast of the Adriatic Sea and had to return. A year or two later, sickness forced him to abandon a journey to the Moors in Spain. In 1217 he proposed to go to France, but Cardinal Ugolino of Segni (later Pope Gregory IX) advised him that he was needed to direct the order in Italy. He did go to Egypt, where the crusaders were besieging Damietta, in 1219. He went into the camp of the Saracens and preached to the Sultan, who was impressed by him and gave him permission (it is said) to visit the holy places in Palestine.

News of disturbances among the friars in Italy forced Francis to return. There were 5,000 members of the men's order, and it was continuing to grow at a faster rate than any previous religious order; yet the order had little more than Francis' example and his brief rule of life to guide its increasing numbers. To provide someone to handle the order's practical affairs, Francis appointed Peter Catanii as his vicar; after Peter's early death in 1221 he chose Elias of Cortona. Francis asked Pope Honorius III for legislation introducing a year of probation (novitiate) for new friars and set about amplifying and revising the rule. After the new rule was approved by Honorius III in final form on Nov. 29, 1223, Francis tended to withdraw more and more from external affairs.

Francis' vision and the stigmata of the Crucified. In the summer of 1224 Francis went to the mountain retreat of La Verna (Alvernia), not far from Assisi, to celebrate the feast of the Assumption of the Blessed Virgin Mary (August 15) and to prepare for St. Michael's Day (September 29) by a 40-day fast. There he prayed that he might know how best to please God; opening the Gospels for the answer, three times he came upon references to the Passion of Christ. As he prayed one morning, about the time of the feast of the Exaltation of the Cross (September 14), suddenly he beheld a figure coming toward him from the heights of heaven. St. Bonaventure, general of the Franciscans from 1257 to 1274 and an important thinker of the 13th century, wrote:

As it stood above him, he saw that it was a man and yet a Seraph with six wings; his arms were extended and his feet conjoined, and his body was fixed to a cross. Two wings were raised above his head, two were extended as in flight, and two covered the whole body. The face was beautiful beyond all earthly beauty, and it smiled gently upon Francis. Conflicting emotions filled his heart, for though the vision brought great joy, the sight of the suffering and crucified figure stirred him to deepest sorrow. Pondering what this vision might mean, he finally understood that by God's providence he would be made like to the crucified Christ not by a bodily martyrdom but by conformity in mind and heart. Then as the vision disappeared, it left not only a greater ardour of love in the inner man but no less marvelously marked him outwardly with the stigmata of the Crucified.

For the remainder of his life, Francis took the greatest care to hide the stigmata—marks resembling the wounds on the crucified body of Jesus Christ. After the death of Francis,

Brother Elias announced the stigmata to the order by a circular letter. Later, Brother Leo, who was the confessor and intimate companion of the saint and who left a written testimony of the event, said that in death Francis seemed like one just taken down from the cross.

Francis lived two years longer, in constant pain and almost totally blind (he had contracted an eye disease in the East). Medical treatment at Rieti was unsuccessful, and after a stay at Siena he was brought back to Assisi, where he died at the Porziuncola. He was buried temporarily in the church of S. Giorgio, at Assisi. In 1230 his body was transferred to the lower church of the basilica that was being erected in his memory by Elias at the west end of the city. (I.C.B.)

BIBLIOGRAPHY. *The writings of St. Francis.* Critical editions by Leonard Lemmens (1901) and by H. Boehmer (1904); English translations by Pascal Robinson (1908), Leo Sherley-Price (1959), and Benen Fahey, with introduction and notes by Placid Hermann (1964).

Early biographies. Thirteenth-century biographies include Thomas of Celano, *First and Second Life of St. Francis, with Selections from Treatise on the Miracles of Blessed Francis*, trans. by Placid Hermann (1963), writings dated, respectively, 1228–30, 1247, and c. 1253—composed by a friar who knew Francis personally; "The Legend of the Three Companions (1246)," in *St. Francis of Assisi: His Holy Life and Love of Poverty*, trans. by Placid Hermann (1964); St. Bonaventure, *The Greater Life of St. Francis, and the Shorter Life* (1260–62), trans. by Benen Fahey, with introduction and notes by Placid Hermann (1965), a theologian's approach to the saint, with some new material gathered from surviving companions. Fourteenth-century compilations abound; the following exist in English translations: *The Mirror of Perfection*, wrongly attributed to Brother Leo (trans. by Leo Sherley-Price, 1959; Everyman ed., 1963); *The Fioretti or Little Flowers of St. Francis*, ed. by Raphael Brown (1958), ed. by Leo Sherley-Price (1959), Everyman ed. (1963)—though full of legends and even falsifications, the work gives a certain insight into the Franciscan spirit of self-abnegation, love, and spiritual joy. A more complete listing and critical evaluation of the sources of the life of St. Francis, together with all important studies up to 1963, may be found in the appendixes to Omer Englebert, *Saint Francis of Assisi: A Biography*, 2nd ed. rev. by Ignatius Brady and Raphael Brown (1965).

Modern biographies. Johannes Jorgensen (1907; Eng. trans. 1912; 3rd ed., 1955); Father Cuthbert (1912; new ed. 1956); G. K. Chesterton (1924, 1957); Englebert (*op. cit.*); for others, see Raphael Brown, in Englebert's *Saint Francis*, pp. 525–527. The development of the Franciscan movement within the lifetime of St. Francis is admirably treated by Cajetan Esser in *Origins of the Franciscan Order* (1970); and briefly, with a biographical sketch of St. Francis, in John R. Moorman, *A History of the Franciscan Order from Its Origins to the Year 1517* (1968). The spirituality of the saint is studied by Cajetan Esser and Engelbert Grau in *Love's Reply*, trans. by Ignatius Brady (1963).

Francis of MEYRONNES, French FRANCIS DE MEYRONNES, Latin FRANCISCUS DE MAYRONIS (b. c. 1285, Meyronnes, County of Provence—d. after 1328, Piacenza, Lombardy), Franciscan monk, one of the principal philosopher-theologians of 14th-century Scholasticism and a leading advocate of the subtle system of Realism proposed by the English Scholastic John Duns Scotus.

A student of Duns Scotus at the University of Paris, Francis became a master in theology in 1323 and lectured on the basic philosophical theology text of his day, the *Sentences* of Peter Lombard. He served as legate of Pope John XXII and in 1324 mediated peace negotiations between Charles IV of France and Edward III of England. About that same period he was invited to preach on sacramental theology before the papal court at Avignon, Fr.

Chief among Francis' philosophical writings are commentaries on Aristotle's *On Interpre-*

tation and the *Categories*, and his own treatises *De Formalitatibus* ("On Formalities") and *De univocatione Entis* ("On the Univocality of Being"). His theological works include an important commentary on Peter Lombard's *Sentences*, the *Quaestiones quodlibetae* ("Miscellaneous Questions"), and a collection of tracts on disputed questions and political theories (one of which suggested a universal monarchy headed by the pope).

While supporting the Scotistic teaching that denied the reality of abstract natures or essences in material things, Francis nevertheless vigorously opposed the Nominalism of William of Ockham on the grounds that it did not admit the real existence of essence even as eternal idea. Moreover, he emphasized Scotus' voluntarism (the primacy of will over intellect), and attributed a greater role to the juridical element in the theological concepts of God, creation, and revelation. Representative of the Franciscan school of devotion, he also promoted the doctrine of the Virgin Mary, specifically the virgin birth, and the belief in the Immaculate Conception.

Because of his distinctive evolution of Scotism, a *Maronitae* (The Meyronnists) school of thought emerged and influenced 14th- and 15th-century Scholasticism. His collected works were edited in Venice in 1520.

FRANCIS OF PAOLA, SAINT, Italian SAN FRANCESCO DE PAOLA (b. March 27, 1416, Paola, Kingdom of Naples—d. April 2, 1507, Plessis-les-Tours, Fr.; canonized 1519; feast day April 2), founder of the Minim Friars, a severely ascetic Roman Catholic order that does charitable work and refrains from eating meat, eggs, or dairy products. Francis was named patron of Italian seamen in 1943 by Pope Pius XII because many of the miracles attributed to him were related to the sea.

After spending a year at the Franciscan friary in San Marco, Italy, he became a hermit at 14 in a cave on the seacoast near Paola. Others joined him (c. 1435) to form his first friary of Hermits of St. Francis of Assisi, which he named (1492) *Fratres Minimi* (Least Brothers) to signify its humility. The rules of the order were similar to those of the Franciscans, only more arduous. After papal approval in 1474, the order spread through Italy to France, Spain, Germany, and Bohemia. The ailing King Louis XI of France induced Pope Sixtus IV to send Francis to him in his final days (1483). Successive monarchs built monasteries for Francis, keeping him in France until his death. By 1506, when Pope Julius II approved the definitive Minim rule, Francis had established a second order for nuns and a third for laymen. There were some 9,000 friars in the order at the peak of its influence in the 17th century. His relics were disinterred and burned by Huguenots in 1562.

FRANCIS OF SALES, SAINT, also called FRANCIS DE SALES, French SAINT FRANÇOIS DE SALES (b. Aug. 21, 1567, Thorens-Glières, Savoy—d. Dec. 28, 1622, Lyon; canonized 1665; feast day January 24), Roman Catholic bishop of Geneva and doctor of the church, who was active in the struggle against Calvinism and cofounded the order of Visitation Nuns. He wrote the devotional classic *Introduction to a Devout Life* (3rd definitive edition, 1609), which emphasized that spiritual perfection is possible for people busy with the affairs of the world and not only, as many believed at the time, for those who withdraw from society. In 1923 Pope Pius XI named him patron saint of writers.

He was educated at the Jesuit college of Clermont in Paris (1580–88) and at Padua, Italy, where he received a doctorate in law (1591). After briefly practicing law he turned to religion and was ordained in 1593 at An-

necy, chief town of his native Savoy. Francis began intense missionary work in Chablais, a district that had broken away from Savoy and had become Calvinist but had been regained by the duke of Savoy, Charles Emmanuel, an ardent Catholic. Under his protection, Francis won the bulk of the people of Chablais to Catholicism. Francis was consecrated bishop of Geneva on Dec. 8, 1602. In 1610, with St. Jane Frances de Chantal, he founded the Visitation of Holy Mary (the Visitation Nuns), which became principally a teaching order.

Francis was the first to receive a solemn beatification at St. Peter's, Rome (1661). In 1877 he became the first writer in French to be named doctor of the church. In addition to

St. Francis of Sales, detail from an oil painting by an unknown artist, 1618

his spiritual works, his writings include controversies against Calvinists, letters, sermons, and documents on diocesan administration.

Francis XAVIER, SAINT: see Xavier, Saint Francis.

Francis, James Bicheno (b. May 18, 1815, Southleigh, Devon, Eng.—d. Sept. 18, 1892, Lowell, Mass., U.S.), British-American hydraulic engineer and inventor of the mixed-flow, or Francis, turbine (a combination of the radial- and axial-flow turbines) that was used for low-pressure installations.

In 1833 Francis went to the United States and was hired by the engineer G.W. Whistler to help construct the Stonington (Conn.) Railway. In Lowell he joined the Proprietors of the Locks and Canals on the Merrimack River as a draftsman and at age 22 became chief engineer of the company. In his 40 years of managing the company's waterpower interests and acting as a consulting waterpower engineer to factories, he contributed greatly to the rise of Lowell as an industrial centre.

He also investigated timber preservation, the testing and design of cast-iron girders, and fire protection systems. In addition to the Francis turbine, he is known for his formulas for the flow of water over weirs and many other hydraulic studies. Francis wrote more than 200 technical papers and, although unschooled, was considered one of the foremost civil engineers of his time.

Francis, Lydia Maria: see Child, Lydia Maria.

Francis, Sir Philip (b. Oct. 22, 1740, Dublin, Ire.—d. Dec. 23, 1818, London, Eng.), English politician and pamphleteer, known as an antagonist of Warren Hastings, the first governor-general of British India.

The son of a clergyman, he was educated in Dublin and London and held a variety of clerical posts in the government from 1756 to 1773. Francis may have written the *Letters of Junius*, a series of bitter lampoons against the

government of King George III published by a London newspaper from 1769 to 1772, when he was a clerk in the war office.

In June 1773 the prime minister, Lord Frederick North, appointed him a member of the newly created four-man council that was to rule British possessions in India with Governor-General Hastings. Francis led two of

his colleagues in a struggle against Hastings; in part because he coveted Hastings' job, but there were also differences between the two men on policy matters, including land-revenue collection. Although Hastings gained the upper hand by 1776—after two of the opposing councillors had died—Francis continued his attacks, and in 1780 the governor-general wounded him in a duel. Returning to England in 1781, Francis turned public opinion against Hastings with a series of anonymous pamphlets. He entered Parliament in 1784 and was the moving spirit behind Hastings' impeachment, begun in 1788. The acquittal of Hastings in 1795 embittered Francis deeply and led to his defeat in a parliamentary election. He served again in Parliament from 1802 to 1807, when he retired from politics. He was knighted in 1806.

Francis, Sam, in full SAMUEL LEWIS FRANCIS (b. June 25, 1923, San Mateo, Calif., U.S.—d. Nov. 4, 1994, Santa Monica, Calif.), American painter who was prominent in the second generation of Abstract Expressionists.

Francis studied medicine at the University of California at Berkeley in 1941–43 and began painting while in a hospital after being wounded in World War II. He painted his first abstract compositions in 1947. From 1950 to 1957 he lived and worked in Paris, where he came under the influence of the Tachist painters as well as that of Jackson Pollock. He had his first solo exhibition in Paris in 1952. Francis' "Blue on a Point" (1958) exemplifies his lyrical and elegant approach to Abstract Expressionism. His brilliant colours

flow in amorphous, kidney-shaped forms over unpainted canvas, creating a loose, uncrowded effect. Thinly textured paint is applied to the

canvas in drips and splashes, creating areas of bright colour that are balanced against each other in powerful asymmetries. His later works, in which narrow streams of colour at the edges of the picture frame a central white space of unpainted gesso, had affinities to the Minimalist painters of the 1960s.

Francis, Thomas, Jr. (b. July 15, 1900, Gas City, Ind., U.S.—d. Oct. 1, 1969, Ann Arbor, Mich.), American microbiologist and epidemiologist who isolated the viruses responsible for influenza A (1934) and influenza B (1940) and developed a polyvalent vaccine effective against both strains. He also conducted research that led to the development of antisera for the treatment of pneumonia.

Francis received his medical degree from Yale University (1925) and worked at the Rockefeller Institute for Medical Research (1928–36), the Rockefeller Foundation (1936–38), and the medical school of New York University (1938–41). He then joined the School of Public Health at the University of Michigan. In 1954 he was appointed by the National Foundation for Infantile Paralysis to direct the large-scale field tests that led to the widespread use of the Salk vaccine against poliomyelitis.

Francis Ferdinand, ARCHDUKE OF AUSTRIA-ESTE, GERMAN FRANZ FERDINAND, ERZHERZOG VON ÖSTERREICH-ESTE (b. Dec. 18, 1863, Graz, Austria—d. June 28, 1914, Sarajevo, Bosnia and Herzegovina), Austrian archduke whose assassination was the immediate cause of World War I.

Francis Ferdinand was the eldest son of the archduke Charles Louis, who was the brother of the emperor Francis Joseph. The death of the heir apparent, the archduke Rudolf, in 1889, made Francis Ferdinand next in succession to the Austro-Hungarian throne after

his father, who died in 1896. But because of Francis Ferdinand's ill health in the 1890s, his younger brother Otto was regarded as more likely to succeed, a possibility that deeply embittered Francis Ferdinand. His desire to marry Sophie, countess von Chotek, a lady-in-waiting, brought him into sharp conflict with the emperor and the court. Only after renouncing his future children's rights to the throne was themorganatic marriage allowed in 1900.

In foreign affairs he tried, without endangering the alliance with Germany, to restore Austro-Russian understanding. At home he thought of political reforms that would have strengthened the position of the crown and weakened that of the Magyars against the other nationalities in Hungary. His plans were based on the realization that any nationalistic policy pursued by one section of the population would endanger the multinational Habsburg empire. His relationship with Francis Joseph was exacerbated by his continuous pressure on the emperor, who in his later years left affairs to take care of themselves but sharply resented any interference with his prerogative. From 1906 onward Francis Ferdinand's influ-

ence in military matters grew, and in 1913 he became inspector general of the army.

In June 1914 he and his wife were assassinated by the Serb nationalist Gavrilo Princip at Sarajevo; a month later World War I began with Austria's declaration of war against Serbia.

Francis Joseph, German FRANZ JOSEPH (b. Aug. 18, 1830, Schloss Schönbrunn, near Vienna—d. Nov. 21, 1916, Schloss Schönbrunn), emperor of Austria (1848–1916) and king of Hungary (1867–1916), who divided his empire into the Dual Monarchy, in which Austria and Hungary coexisted as equal part-

ners. In 1879 he formed an alliance with Prussian-led Germany, and in 1914 his ultimatum to Serbia led Austria and Germany into World War I.

Early years. Francis Joseph was the eldest son of Archduke Francis Charles and Sophia, daughter of King Maximilian I Joseph of Bavaria. As his uncle Emperor Ferdinand I was childless, Francis Joseph was educated as his heir-presumptive. In the spring of 1848 he served with the Austrian forces in Italy, where Lombardy-Venetia, supported by King Charles Albert of Sardinia, had rebelled against Austrian rule. When revolution spread to the capitals of the Austrian Empire, Francis Joseph was proclaimed emperor at Olmütz (Olomouc) on Dec. 2, 1848, after the abdication of the emperor Ferdinand—the rights of his father, the archduke, to the throne having been passed over. Hopes of a revival of monarchist sentiments were raised by his radiant, youthful appearance.

Of all his mentors, the old chancellor Metternich probably exerted the most lasting influence on Francis Joseph. A more profound influence, however, was that of his wife, the duchess Elizabeth of Bavaria. He married her in 1854 and remained deeply attached to her throughout a stormy marriage.

Neo-absolutism, 1841–59. During the first 10 years of his reign, the era of so-called neo-absolutism, the Emperor—aided by such outstanding advisers as Felix, Fürst zu Schwarzenberg (until 1852), Leo, Graf von Thun, and Alexander, Freiherr von Bach—inaugurated a very personal regime by taking a hand both in the formulation of foreign policy and in the strategic decisions of the time. Together with Schwarzenberg, who had become prime minister and foreign minister in 1848, Francis Joseph set out to set his empire in order.

In external affairs Schwarzenberg achieved a powerful position for Austria; in particular, with the Olmütz convention of November 1850, in which Prussia acknowledged Austria's predominance in Germany. In home affairs, however, Schwarzenberg's harsh rule and the formation of an intolerant police apparatus evoked a latent mood of rebellion. This mood became more threatening after 1851, when the government withdrew the promise of a

constitution, given in 1849 under the pressure of the revolutionary troubles. That retraction had long aftereffects and led to the Liberals' permanent distrust of Francis Joseph's rule. In 1853 there was an attempt on the Emperor's life in Vienna and in a riot in Milan.

After Schwarzenberg's death (1852), Francis Joseph decided not to replace him as prime minister and took a greater part in politics himself. Austria's mistaken policy during the Crimean War originated largely with the Emperor, torn between gratitude to Russia for its help in quelling a rebellion in Hungary in 1849 and the advantage the monarchy might derive from siding with Great Britain and France. The mobilization of a part of the Austrian Army in Galicia on the borders of Russia in retrospect turned out to have been a grave error. It gained no friends for Austria among the Western powers but lost considerable goodwill that Tsar Nicholas I had earlier harboured for Francis Joseph.

At home, neo-absolutism resulted in a civil service staffed by highly competent experts who tried to meet the Emperor's high standards but whose limitations nevertheless became increasingly obvious in 1859–60 as they attempted to deal with the empire's complex financial problems. Army expenditures had to be curtailed in 1859, when a series of ill-fated wars began that seriously shook Austria's military reputation. Moreover, the police regime proved to be impracticable in the long run. Thus the government made critical military decisions against a background of many unresolved problems in finances and home affairs. For many of these decisions, especially the unfortunate outcome of the war of 1859 against the Kingdom of Sardinia and the Empire of France, the Emperor was responsible. After provoking Austria into war, Count Cavour, the prime minister of Sardinia, planned to use the French Army to oust Austria from Italy. When the imperial commander in chief proved incapable, Francis Joseph himself took over the supreme command, but he could not prevent the defeat of Solferino (June 24, 1859). Dismayed by Prussia's demand that, as a condition of its intervention on the Emperor's side, the Austrian Army be placed under Prussian command, Francis Joseph hastily concluded the Peace of Villafranca in July 1859, under which Lombardy was ceded to Sardinia. Unreconciled to this settlement, Francis Joseph adopted a foreign policy that prepared the way for a passage at arms with Italy and Prussia, by which he hoped to regain for Austria its former position in Germany and Italy, as it had been established by Metternich in 1814–15.

The years of decision, 1859–70. The mood of crisis after the defeat of 1859 caused Francis Joseph to pay renewed attention to the constitutional question. A period of experiments—alternating between federalistic and centralistic charters—kept the country in a permanent state of crisis until 1867. The congress of princes at Frankfurt in 1863, for which the reigning heads of all German states assembled with the sole exception of the King of Prussia, was a high point in Francis Joseph's life. Yet the absence of the Prussian king demonstrated that Prussia no longer regarded Austria as the leading German power.

Francis Joseph had vainly tried to postpone the decision for predominance in Germany by entering into a comradeship-in-arms with Prussia in a war against Denmark in 1864. After their victory, squabbles arose between them, and war with Prussia became inevitable. The conclusion of an alliance between Italy and Prussia pointed up the dangerous possibility that both foreign-policy problems might have to be faced at the same time, yet Francis Joseph failed in his attempt to avoid an armed conflict at least with Italy. In June 1866 Austria concluded a possibly unique agreement with Napoleon III of France that stipulated

that Austrian-held Venetia was to be given to the Kingdom of Sardinia regardless of the outcome of the impending war with Prussia. As the Emperor considered it incompatible with the army's honour to cede a province without fighting, war with Italy broke out despite the agreement. In later years, Francis Joseph characterized his policy of yielding territory with one hand while fighting for it with the other as honest but stupid, whereas the chancellor Friedrich, Graf von Beust, called the agreement the most shocking document that he had ever seen. Although its defeat in the war with Prussia that the Prussian prime minister Otto von Bismarck had forced on the unprepared monarchy caused Austria no territorial loss in the north, it nevertheless sealed Austria's expulsion from Germany. The victories gained by the Austrian Army in the south, moreover, could not prevent the loss of Venetia, so that Austria found itself expelled from Italy as well.

The appointment of the Saxon premier, Graf von Beust, as Austrian prime minister in 1867 shows that initially Francis Joseph was once again unwilling to accept the decision. Beust's cherished project of an Austrian-French-Italian alliance against Prussia did not materialize, however, and in 1870 the attitude of the Hungarian prime minister, Count Gyula Andrassy, coupled with the rapid military successes of Prussia, prevented Austria from joining in the Franco-German War at the side of France. Andrassy, appointed imperial foreign minister after Beust's dismissal in 1871, inaugurated the policy of close collaboration with Germany that later became the cornerstone of Francis Joseph's foreign policy.

The Hungarian compromise and the dual monarchy. The failure to achieve a federalist solution satisfactory to all nationalities had exacerbated relations among them. In 1867 it had become obvious that a compromise had to be made with the restive Hungarians. The newly appointed prime minister Beust was, however, insufficiently informed about conditions in the various parts of the Austrian Empire. The result was the *kaiserliche und königliche Doppelmonarchie*, the "imperial and royal Dual Monarchy" in which an Austrian and a Hungarian half coexisted in equal partnership. The compromise, however, gave the Hungarians considerable leverage to extend their influence. The losers were the Slav peoples, for the Bohemians (Czechs) and Poles did not share in the privileged position of the German Austrians in the Austrian, or western, half of the empire, while the Croats, Slovaks, and South Slavs had none of the prerogatives enjoyed by the Hungarians in the Hungarian, or eastern, half. With this preferred treatment, which Francis Joseph recognized as such, the multinational state had violated its inner law of the basic equality of all national groups. The individual crownland's relationship to the emperor, which in each case had been the result of a long historical evolution, was now replaced by the submission of the various nationalities to German-Austrian or Hungarian overlordship. Internal restlessness thus continued unabated. A final attempt at reform by which the Slavic languages were to be given equal status with Hungarian and German was vetoed by Francis Joseph under pressure from the German-Austrian nationalists. But, under the influence of the Viennese sociologist Albert Schäffle, the Emperor, who on the whole had little use for party politicians and their influence on public life, seems to have followed the continuing process of democratization in his empire with some sympathy.

The question of recognition and restoration of ancient Czech rights hobbled Austro-Hungarian foreign policy and poisoned domestic politics. Even more of a handicap was the

problem of the South Slavs. From 1867 on, the Hungarian-ruled Croats found themselves subjected to a continuing process of Magyarization. Hungarian domination eventually turned Serbia, inhabited by fellow Slavs, into the Dual Monarchy's mortal enemy.

Francis Joseph, who wholeheartedly supported the *Ausgleich* (the Hungarian Compromise) as the constitution of the Dual Monarchy, failed to grasp the negative aspects of that highly complex document. Interested primarily in questions of foreign policy and military leadership, he paid too little attention to domestic affairs to understand the nationalities problem in all its gravity. In particular, he failed to see the connection between Austro-Hungarian internal affairs and their effect on the monarchy's relationship with Russia and on the political situation in the Balkans.

The Emperor's peace policy. Although Francis Joseph always considered foreign policy his own specialty, he was in effect guided by the ablest among his foreign ministers: Count Gyula Andrassy, Count Gusztáv Kálnoky von Köröspatak, and Count Aloys Lexa von Aehrenthal. Andrassy not only launched the alliance with Germany in 1879, but, by carrying out the occupation of Bosnia-Hercegovina, which Francis Joseph had advocated and the Congress of Berlin (1878) had sanctioned, he also gained the first great foreign-policy success of the empire in the Balkans. Francis Joseph defended the German alliance against all opposition. He was considerably more reserved toward Italy, which had joined Germany and Austria in the Triple Alliance in 1882, and Romania, with which Austria-Hungary had concluded a secret treaty in 1883; in fact, his reticence contributed to the eventual alienation of both of those allies.

The style of Francis Joseph's foreign policy was dynastic and personal. Just as he had contributed decisively to the creation of the League of the Three Emperors (*Dreikaiserbund*) by appearing in Berlin in 1873 by the side of Tsar Alexander II, he endeavored also on later occasions to forestall potential conflicts with Russia through personal contacts, without realizing the fundamental nature of the antagonism between the two countries. On a visit to St. Petersburg in 1897 and again after Tsar Nicholas II's visit in 1903, he tried to delimit Austrian and Russian interests in the Balkans—a policy that was rashly jeopardized by Aehrenthal during the crisis leading to the annexation of occupied Bosnia-Hercegovina in 1908. By then, however, the days were long past when foreign policy was a matter of friendships between sovereigns; conflicts of interest, or for that matter pan-Slav propaganda, could no longer be neutralized on the dynastic level. Also, the emperor found it increasingly difficult to get along with his fellow sovereigns, many of them relatives, of the younger generation. Yet he seems to have appreciated the energetic, dashing, and optimistic manner of William II of Germany.

In the period 1908–14 Francis Joseph held fast to his peace policy in the face of warnings by the chief of the general staff, Franz, Count Conrad von Hötzendorf, who repeatedly advocated a preventive war against Serbia or Italy. Yet, without having fully thought out the consequences, he let himself in July 1914 be persuaded by Count Leopold Berchtold, the foreign minister, to issue the intransigent ultimatum to Serbia that led to World War I.

Assessment. Although he had been raised to be a soldier and wore a uniform all his life, Francis Joseph was no more a strategist than he was a statesman. He made up for this deficiency by the careful study of documents, by an extraordinarily retentive memory, and by being a shrewd judge of character. Invariably well informed and familiar with the reports

of his envoys, he was to his civil servants an unequalled model of exactitude, devotion to duty, and justice. In his time Austria-Hungary was credited with having a civil administration that was as efficient as any in Europe. Having reserved for himself the control of foreign policy and of all matters bearing on the army, he stated repeatedly that this foreign policy was his own and that any criticism of it was in reality directed at himself. While loyal to his ministers, he refused to grant them any influence beyond the limits of their respective offices; once dismissed, a minister was no longer consulted on official business. This attitude, which many considered to be both ungrateful and ungracious, sprang in part from a punctiliousness that was hard to penetrate and rendered him incapable of true friendship. In the early decades of his reign, his correct but unapproachable bearing caused Francis Joseph to be respected but not really popular. Toward the end of his life, however, he became a universally revered man, a personality that for all its defects and insufficiencies held together the rotting structure of the multinational state.

Although a gentleman of irresistible charm in personal contact, Francis Joseph was greatly feared as the head of his house. His attitude toward his family was determined primarily by dynastic considerations. His own marriage had been a love match, and he remained devoted to his wife even after the marriage had been wrecked by her eccentricities. Her assassination, in Geneva on Sept. 10, 1898, saddened him profoundly. The tragedy of the heir apparent, the archduke Rudolf, who dramatically shot himself in a suicide love pact with a 17-year-old baroness at Mayerling on Jan. 30, 1889, was assuredly rooted in Rudolf's unstable character. Yet the emperor had contributed to his only son Rudolf's instability by giving him an unsuitable education, forcing him to marry Princess Stephanie of Belgium, and dealing with him in an altogether cold and uncomprehending manner. He treated his daughter-in-law with unforgiving harshness after her second,morganatic marriage, believing that family members who married beneath their station had committed a crime against the dynasty. Furthermore, Francis Joseph never became reconciled to the morganatic union of the next heir presumptive, Archduke Francis Ferdinand. His statements on receiving the report of the archducal couple's murder at Sarajevo, on June 28, 1914, show that he looked upon their fate as a token of divine retribution. These tragedies, which became public knowledge, were underlined by an unending series of sometimes heated family disputes in the course of which Francis Joseph forced the members of the House of Habsburg-Lorraine to conform to his own notion of an archduke's dignity and position. Yet this man who became ever lonelier as time went on could be a generous and amiable family father to his daughters and those members of the house who bowed to his wishes.

The only member of the immediate family with whom he had a closer relationship was his youngest brother, the archduke Louis Victor. While he was no more than correct in his attitude toward his brother, the talented and ambitious archduke Maximilian, he bears no blame for the tragedy that ended Maximilian's brief interlude as emperor of Mexico.

Having overcome the threat to its survival in 1848–49, Austria passed through a long metamorphosis with many ups and downs in the 68 years that Francis Joseph occupied the throne. His many mistakes were balanced by splendid achievements. The social legislation enacted by the prime minister Eduard, Count von Taaffe, during the 1880s, the new penal code of 1852, the trade regulations of 1859, and the commercial code of 1862 are all examples of a civil administration that was highly regarded throughout Europe. Those achieve-

ments bore the stamp of the Emperor's own silent devotion to duty. (K.O.V.A.)

Franciscan, any member of a Christian religious order founded in the early 13th century by St. Francis of Assisi (*q.v.*). The members of the order strive to cultivate the ideals of the order's founder. The Franciscans actually consist of three orders. The First Order comprises priests and lay brothers who have sworn to lead a life of prayer, preaching, and penance. This First Order is divided into three independent branches: the Friars Minor (O.F.M.), the Friars Minor Conventual (O.F.M. Conv.), and the Friars Minor Capuchin (O.F.M. Cap.). The Second Order consists of cloistered nuns who belong to the Order of St. Clare (O.S.C.) and are known as Poor Clares (P.C.). The Third Order consists of religious and lay men and women who try to emulate Saint Francis' spirit by performing works of teaching, charity, and social service. Strictly speaking, the latter order consists of the Third Order Secular, whose lay members live in the world without vows; and the Third Order Regular, whose members live in religious communities under vow. Congregations of these religious men and women are numerous all over the Roman Catholic world. The Franciscans are the largest religious order in the Roman Catholic church. They have contributed a total of 98 saints and six popes to the church.

It was probably in 1207 that Francis felt the call to a life of preaching, penance, and total poverty. He was soon joined by his first followers, to whom he gave a short and simple rule of life. In 1209 he and 11 of his followers journeyed to Rome, where Francis received approval of his rule from Pope Innocent III. Under this rule, Franciscan friars could own no possessions of any kind, either individually or communally (*i.e.*, as the property of the order as a whole). The friars wandered and preached among the people, helping the poor and the sick. They supported themselves by working and by begging food, but they were forbidden to accept money either as payment for work or as alms. The Franciscans worked at first in Umbria and then in the rest of Italy and abroad. The impact of these street preachers and especially of their founder was immense, so that within 10 years they numbered 5,000. Affiliated with them were the Franciscan nuns, whose order was founded at Assisi in 1212, by St. Clare, who was under the guidance of St. Francis. Clare and her followers were lodged by Francis in the Church of San Damiano, where they lived a severe life of total poverty. They later became known as the Poor Clares or the Order of St. Clare.

During the first years of the Franciscans, the example of Francis provided their real rule of life, but, as the order grew, it became clear that a revised rule was necessary. After preparing a rule in 1221 that was found too strict, Francis, with the help of several legal scholars, unwillingly composed the more restrained final rule in 1223. This rule was approved by Pope Honorius III.

Even before the death of Francis in 1226, conflicts had developed within the order over the observance of the vow of complete poverty. The rapid expansion of the order's membership had created a need for settled monastic houses, but it was impossible to justify these if

François' rule of complete poverty was followed strictly. Three parties gradually appeared: the Zealots, who insisted on a literal observance of the primitive rule of poverty affecting communal as well as personal poverty; the Laxists, who favoured many mitigations; and the Moderates, or the Community, who wanted a legal structure that would permit some form of communal possessions. Something of an equilibrium was reached between these different schools of thought while St. Bonaventure was minister general (1257–74). Sometimes called the second founder of the order, he provided a wise, moderate interpretation of the rule. During this period the friars spread throughout Europe, while missionaries penetrated Syria and Africa. Simultaneously, the friars' houses in university towns such as Paris and Oxford were transformed into schools of theology that rapidly became among the most celebrated in Europe.

With the death of Bonaventure, the internal dissensions of the order flared up anew. The Zealots, who now became known as the Spirituals, demanded absolute poverty. Opposed to them were the Community, or the Conventuals, who stood for a more moderate community life adapted to the needs of study and preaching. Papal decisions favoured the Conventuals, and the Spirituals ceased to be a faction of importance in the order after 1325.

The latter part of the 14th century saw a great decline in the religious life of the friars. But throughout that century a series of reformers initiated groups of friars, known as Observants, living an austere life apart from the main body of Conventuals. Under the leadership of St. Bernardino of Siena and St. John of Capistrano, the Observants spread across Europe. Though several attempts were made to reconcile them with the Conventuals, the outcome was in fact a complete separation in 1517, when all the reform communities were united in one order with the name Friars Minor of the Observance, and this order was granted a completely independent and autonomous existence. It is estimated that in 1517 the Observants numbered about 30,000, the Conventuals about 25,000.

The union of the Observants was short-lived as several stricter groups arose. One of these reform groups, the Capuchins (*q.v.*), founded in 1525, was separated as the third branch of the Franciscan Order in 1619. The other groups were finally reunited to the Observants by Pope Leo XIII in 1897 with new constitutions and the official title Order of Friars Minor. All three branches of the Franciscans suffered in the French Revolution, but they revived during the 19th century.

The Franciscans have popularized several devotional practices in the Roman Catholic church. Among the best known are the Christmas crib, the Stations of the Cross, and the Angelus. Besides their traditional role of preaching, Franciscans have been active in the work of foreign missions and have made many contributions to the field of education and scholarship.

Francofort, town, eastern Botswana. It lies along the Tati (Tate) River and is an administrative and commercial centre. Francofort is the site of the Dumela industrial complex. Some gold is mined in the vicinity. The town lies in farming country on the country's main road and rail line. Air transport services link Francofort with Gaborone and Selebi-Phikwe. Pop. (1991) 65,244.

francium (Fr), heaviest chemical element of Group 1a in the periodic table, the alkali metal group. It exists only in short-lived radioactive forms. Natural francium cannot be isolated in visible, weighable amounts, for only about 30 grams (about one ounce) occurs at any time in the crust of the Earth. Marguerite Perey discovered francium (1939) while studying actinium-227, which decays by negative

beta decay (electron emission) to an isotope of thorium (thorium-227) and by alpha emission (about 1 percent) into an isotope of francium (francium-223) that was formerly called actinium K (AcK) and is a member of the actinium decay series. Though it is the longest-lived isotope of francium, francium-223 has a half-life of only 21 minutes. Isotopes of francium with masses between 204 and 224 have been artificially prepared, and, because natural francium cannot be concentrated, it too is prepared by neutron irradiation of radium to produce actinium, which decays to produce traces of francium. The chemistry of francium can be studied only by methods designed for trace quantities. In all respects its observed behaviour, including valence of one, is that to be expected of an alkali element filling a place just below cesium in the periodic table of the elements.

Franck, César, in full CÉSAR-AUGUSTE FRANCK (b. Dec. 10, 1822, Liège, Neth.—d. Nov. 8, 1890, Paris, France), Belgian-French Romantic composer and organist who was the chief figure in a movement to give French music an emotional engagement, technical solidity, and seriousness comparable to that of German composers.

Franck was born of a Walloon father and a mother of German descent. He showed unmistakable musical gifts that enabled him to enter the Liège conservatory at the age of eight, and his progress as a pianist was so astonishing that in 1834 his father took him on tour and a year later dispatched him to Paris, where he worked with the Bohemian composer Anton Reicha, then professor at the Paris Conservatory. In 1836 the whole family, including the younger son Joseph, who played the violin, moved to Paris, and in 1837 César Franck entered the Paris Conservatory. Within a year he had won a Grand Prix d'Honneur by a feat of transposition in the sight-reading test, and this honour was followed by a first prize for fugue (1840) and second prize for organ (1841). Although the boy should now normally have prepared to compete for the Prix de Rome, a prize offered yearly in Paris for study in Rome, his father was determined on a virtuoso's career for him and his violinist brother, with whom he gave concerts, and therefore removed him prematurely from the conservatory.

In order to please his father and earn much-needed money, Franck gave concerts, the programs of which were largely devoted to performing his own showy fantasias and operatic potpourris, popular at that time. After 1840,

when he turned his attention increasingly to the organ, his compositions became noticeably more serious.

Unwilling concert giving, a number of bad press notices, and the teaching needed to supplement his income took a physical toll of his powers. Only when he had finally asserted himself against what amounted to the unscrupulous exploitation of his gifts by his father could he achieve maturity and peace of mind. Franck fell in love with an actress with the professional name of Desmousseaux, whose real name was Félicité Saillot, but because both her parents also worked in the theatre, the family was regarded as unsuitable by the elder Franck, and his son was obliged to leave home some time before marrying her in 1848. After his marriage Franck's way of life changed little for his remaining 42 years. He earned his livelihood as an organist and teacher and led a simple, almost ascetic life.

In 1851 he was appointed organist to the Church of Saint-Jean-Saint-François and in 1858 to that of Sainte-Clotilde, where he was already choirmaster. From the organ loft of Sainte-Clotilde came the improvisations for which he was to become famous and also their elaboration in organ and choral works. This music is all marked by the taste of the day, which was for a facile tenderness and saccharine sweetness in ecclesiastical music.

More important to Franck's career as a composer was his appointment as organ professor at the Paris Conservatory in 1872, which came to him as a surprise because he had indulged in none of the preliminary intrigue customary in such cases. His open-heartedness and lack of sophistication were to make him enemies among his pupils. This enmity was increased by the fact that his organ classes soon became classes of composition, and his pupils not infrequently proved superior to those of the conventional composition professors.

The nucleus of a school of disciples had already begun to form around Franck, but only after the founding of the National Society of Music (Feb. 25, 1871) was a real future assured for the type of music that he was interested in writing and communicating to his pupils. When Vincent d'Indy, a French composer, joined the group of Franck's pupils in 1872, he brought an enthusiasm, a propagandist zeal, and an exclusive personal devotion that played a large part in restoring Franck's confidence in his powers. With Ernest Chausson, Pierre de Bréville, Charles Bordes, and Guy Ropartz the Franck circle was complete in the early '80s, and subsequently d'Indy's very high claims (in his biography, *César Franck*, 1906) led for a time to the suspicion that Franck was "a creation of his own pupils."

The music that he went on to write makes it clear that this is not true. As a composer Franck fulfilled his potential only in the last 10 years (1880–90) of his life. His *Symphony in D Minor* (1888), *Variations symphoniques* (1885), *Piano Quintet in F Minor* (1879), *String Quartet in D Major* (1889), *Sonata in A Major for Violin and Piano* (1886), and several organ pieces mark him as one of the most powerful French composers in the second half of the 19th century. His music is marked by soaring, almost improvisatory melodic flights.

Certainly his early years as performer and composer of virtuoso music left an indelible mark on his musical taste, as can be heard unmistakably in the last movement of the *Prélude, aria et final* for piano (completed 1887) and even momentarily in the *Variations symphoniques* for piano and orchestra. On the other hand, some of his weaker music represents an almost excessive reaction against superficiality and aspires to emotional intensity at all costs, drawing for the purpose on

the examples of Franz Liszt, Richard Wagner, and, more remotely, Beethoven.

Franck died, partly as the result of a street accident, in 1890. The new seriousness of French music in the last quarter of the 19th century derived entirely from Franck and his pupils. Much has been made of his angelic sweetness and simplicity of character, his selflessness and innocence in the ways of the world. These traits are reflected in a blandness of manner, and they proved a handicap when Franck was faced with the necessity of producing strongly contrasting musical ideas, as in the oratorio *Les Béatitudes* (written during the 1870s and performed posthumously) and the symphonic poems *Le Chasseur maudit* (1882; *The Accursed Hunter*) and *Les Djinns* (1884). On the other hand, the *Sonata in A Major for Violin and Piano* and the *Variations symphoniques* remain as all but perfect monuments of a warm and noble musical nature and a strong, thorough craftsmanship that have survived all changes of taste and emotional attitudes.

(M. Du P.C.)

Franck, James (b. Aug. 26, 1882, Hamburg, Ger.—d. May 21, 1964, Göttingen, W.Ger.), German-born American physicist who shared the Nobel Prize for Physics in 1925 with Gustav Hertz for research on the excitation and ionization of atoms by electron bombardment, which demonstrated that an impinging electron must have a certain minimum energy to raise an atom from its ground state to an excited state.

Franck performed his prizewinning work at the University of Göttingen, where he had been appointed professor of physics in 1920. In protest against Nazi policies he resigned his post and went to Denmark (1933). Arriving in the United States in 1935, Franck was appointed professor at Johns Hopkins Uni-

James Franck
Bavaria-Verlag

versity, Baltimore, and in 1938 became professor of physical chemistry at the University of Chicago.

Franck's researches in the fields of photochemistry and atomic physics included determinations from molecular band spectra of the energy involved in the dissociation of molecules. During World War II he worked on the development of the atomic bomb. He sought, however, to stop its use in warfare and suggested that it be exploded in an unpopulated area to reveal its power.

Franck, Sebastian (b. c. 1499, Donauwörth, Bavaria [Germany]—d. c. 1542, Basel, Switz.), German Protestant Reformer and theologian

who converted from Roman Catholicism to Lutheranism but, in eventually departing from Luther's views, emphasized a mystical attitude in place of dogmatic belief.

A fellow student of the Reformer Martin Bucer at Heidelberg, Franck was named a curate in the Roman Catholic diocese of Augsburg soon after 1516. About 1525 he joined the Lutherans at Nürnberg, giving up his curacy to become a preacher for the Reformation. Franck was apparently disappointed by the moral results of the Reformation, however, and as a result he began to move away from Lutheranism. At Nürnberg he evidently came in contact with the Anabaptist Hans Denck's disciples, but he soon denounced Anabaptism as dogmatic and narrow. Increasingly at odds with Lutheran doctrines, dogmatism in general, and the concept of an institutional church, Franck moved in 1529 to Strassburg, which was then a centre of the spiritual movement in Protestantism. There he became a friend of the Reformer and mystic Kaspar Schwenckfeld, who furthered Franck's development as a fierce anti-dogmatician. Franck's major work, *Chronica: Zeitbuch und Geschichtsbibel* (1531; "Chronica: Time Book and Historical Bible"), is a wide-ranging anti-Catholic study of heresies and heretics.

After a short imprisonment for his views, Franck was expelled from Strassburg by the civil authorities. He drifted about Germany and in 1533 moved to Ulm, where he established himself as a printer. Martin Luther finally came to view Franck as a man who wanted to avoid both belief and commitment, and Lutherans at Ulm compelled Franck to leave that city in 1539.

Franck combined the humanist's passion for freedom with the mystic's devotion to a religion based on an inner illumination of the spirit. He regarded the Bible as a book full of contradictions that veiled its true and eternal message, and he considered dogmatic controversy meaningless. He even asserted the extremely anti-dogmatic notion that Christians need know no doctrines beyond the Ten Commandments and the Apostles' Creed. In the end he became a solitary figure who found no realm of truth left but the inner life of a few mystics. Franck's unbiased search for God in various cultures and historical traditions and his emphasis on nondogmatic, nonsectarian, noninstitutional forms of religion mark him as one of the most modern thinkers of the 16th century.

Franck-Hertz experiment, in physics, first experimental verification of the existence of discrete energy states in atoms, performed (1914) by the German-born physicists James Franck and Gustav Hertz.

Franck and Hertz directed low-energy electrons through a gas enclosed in an electron tube. As the energy of the electrons was slowly increased, a certain critical electron energy was reached at which the electron stream made a change from almost undisturbed passage through the gas to nearly complete stoppage. The gas atoms were able to absorb the energy of the electrons only when it reached a certain critical value, indicating that within the gas atoms themselves the atomic electrons make an abrupt transition to a discrete higher energy level. As long as the bombarding electrons have less than this discrete amount of energy, no transition is possible and no energy is absorbed from the stream of electrons. When they have this precise energy, they lose it all at once in collisions to atomic electrons, which store the energy by being promoted to a higher energy level.

Francke, August Hermann (b. March 22, 1663, Lübeck [Germany]—d. June 8, 1727, Halle, Brandenburg), Protestant religious leader, educator, and social reformer who was one of the principal promoters of German Pietism, a devotional revival of per-

sonal Christianity that reacted to academic Lutheranism.

Influenced by the religious enthusiasm movement of Philipp Jakob Spener, Francke founded Pietist groups at the University of Halle, where he taught theology and Oriental languages (1695–1727). His religious so-

August Hermann Francke, engraving
BBC Hulton Picture Library

ciety was criticized by traditional Lutherans for its biblical revivalism and social activism, particularly the founding (1695) at Halle of the Franckesche Stiftung (Francke Institute), which included a school for the poor, orphanage, medical dispensary, and publishing house. Dismissed by the established church, Francke later received the favour of King Frederick William I of Prussia, who, influenced by a visit to the institute (1713), initiated legislation for similar educational centres in his realm.

Franco, Francisco, in full FRANCISCO PAULINO HERMENEGILDO TEÓDULO FRANCO BAHAMONDE, byname EL CAUDILLO (the Leader) (b. Dec. 4, 1892, El Ferrol, Spain—d. Nov. 20, 1975, Madrid), general and leader of the Nationalist forces that overthrew the Spanish democratic republic in the Spanish Civil War (1936–39); thereafter until his death he was the head of the government of Spain.

Life. Franco was born at the coastal city and naval centre of El Ferrol in Galicia (northwestern Spain). His family life was not entirely happy, for Franco's father, an officer in the Spanish Naval Administrative Corps, was eccentric, wasteful, and somewhat dissolute. More disciplined and serious than other boys of his age, Franco was close to his mother, a pious and conservative upper middle-class Catholic. Like four generations and his elder brother before him, Franco was originally destined for a career as a naval officer, but reduction of admissions to the Naval Academy forced him to choose the army. In 1907, only 14 years old, he entered the Infantry Academy at Toledo. Three years later he graduated.

Franco volunteered for active duty in the colonial campaigns in Spanish Morocco that had begun in 1909 and was transferred there in 1912 at the age of 19. The following year he was promoted to first lieutenant in an elite regiment of native Moroccan cavalry. At a time in which many Spanish officers were characterized by sloppiness and lack of professionalism, young Franco quickly showed his ability to command troops effectively and soon won a reputation for complete professional dedication. He devoted great care to the preparation of his unit's actions and paid more attention than was common to the troops' well-being. Reputed to be scrupulously honest, introverted, and a man of comparatively few intimate friends, he was known to shun all frivolous amusements. In 1915 he became the youngest captain in the Spanish army. In the following year he was seriously wounded by a bullet in the abdomen and was brought back to Spain to recover. In 1920 he was chosen to be second in command of

the newly organized Spanish Foreign Legion, succeeding to full command in 1923. In that year he married Carmen Polo, by whom he had a daughter. During the crucial campaigns against the Moroccan rebels, the legion played a decisive role in bringing the revolt to an end. Franco became a national hero, and in 1926, at the age of 33, he was promoted to brigadier general. At the beginning of 1928 he was named director of the newly organized General Military Academy in Saragossa.

After the fall of the monarchy in 1931, the leaders of the new Spanish Republic adopted a sharply antimilitary policy, and Franco's career was temporarily halted. The General Military Academy was dissolved, and Franco was placed on the inactive list. Though he was an avowed monarchist and held the honour of being a Gentleman of the King's Chamber, Franco accepted both the new regime and his temporary demotion with perfect discipline. When conservative forces gained control of the republic in 1933, Franco was restored to active command; in 1934 he was promoted to major general. In October 1934, during the rising of Asturian miners who opposed the admission of three members of the right to the government, Franco was called in to quell the revolt. His success in this operation brought him new prominence. In May 1935 he was appointed chief of the Spanish army's general staff, and he began the work of tightening discipline and strengthening military institutions, both seriously weakened by the republic's earlier antimilitary position.

No longer able to retain control of the country, the centre-right government was dissolved, and new elections were announced for February 1936. By this time the Spanish political parties had split into two factions: the rightist National Bloc and the leftist Popular Front. The left proved victorious in the elections, but the new government was unable to prevent the accelerating dissolution of Spain's social and economic structure. Although Franco had never been a member of a political party, the growing anarchy impelled him to appeal to the government to declare a state of emergency. His appeal was refused, and he was removed from the general staff and sent to an obscure command in the Canary Islands. For some time he refused to commit himself to a military conspiracy against the government, but, as the political system disintegrated, he finally decided to join the rebels.

Franco's military rebellion. At dawn on July 18, 1936, Franco's manifesto acclaiming the military rebellion was broadcast from the Canary Islands, and the same morning the rising began on the mainland. The following day he flew to Morocco and within 24 hours was firmly in control of the protectorate and the Spanish army garrisoning it. After landing in Spain, Franco and his army marched toward Madrid, which was held by the government.

Franco, 1954
AP/Wide World Photos

When the Nationalist advance came to a halt on the outskirts of the city, the military leaders, in preparation of what they believed was the final assault that would deliver Madrid and the country into their hands, decided to choose a commander in chief, or generalissimo, who would also head the rebel Nationalist government in opposition to the republic. Because of his military ability and prestige, a political record unmarred by sectarian politics and conspiracies, and his proven ability to gain military assistance from Adolf Hitler's Germany and Benito Mussolini's Italy, Franco was the obvious choice. In part because he was not a typical Spanish "political general," Franco became head of state of the new Nationalist regime on Oct. 1, 1936. The rebel government did not, however, gain complete control of the country for more than three years.

Franco presided over a government that was basically a military dictatorship, but he realized that it needed a regular civil structure to broaden its support; this was to be derived mainly from the antileftist middle classes. On April 19, 1937, he reorganized the Falange (the Spanish Fascist Party) and made it the rebel regime's official political movement. While expanding the Falange into a more pluralistic group, Franco made it clear that it was the government that used the party and not the other way around. Thus, his regime became an institutionalized authoritarian system, differing in this respect from the Fascist party-states of the German and Italian models.

As commander in chief in the Civil War, Franco was a careful and systematic leader. He made no rash moves and suffered only a few temporary defeats as his forces advanced slowly but steadily; the only major criticism directed at him during the campaign was that his strategy was frequently unimaginative. Nevertheless because of the relatively superior military quality of his army and the continuation of heavy German and Italian assistance, Franco won a complete and unconditional victory on April 1, 1939.

The Civil War had been largely a sanguinary struggle of attrition, marked by atrocities on both sides. The tens of thousands of executions carried out by the Nationalist regime, which continued during the first years after the war ended, earned Franco more reproach than any other single aspect of his rule.

Franco's dictatorship. Although Franco had visions of restoring Spanish grandeur after the Civil War, in reality he was the leader of an exhausted country still divided internally and impoverished by a long and costly war. The stability of his government was made more precarious by the outbreak of World War II only five months later. Despite his sympathy for the Axis powers' "New Order," Franco at first declared Spanish neutrality in the conflict. His policy changed after the fall of France in June 1940, when he approached the German leader Hitler; Franco indicated his willingness to bring Spain into the war on Germany's side in exchange for extensive German military and economic assistance and the cession to Spain of most of France's territorial holdings in northwest Africa. Hitler was unable or unwilling to meet this price, and, after meeting with Franco at Hendaye, France, in October 1940, he remarked that he would "as soon have three or four teeth pulled out" as go through another bargaining session like that again. Franco's government thenceforth remained relatively sympathetic to the Axis powers while carefully avoiding any direct diplomatic and military commitment to them. Spain's return to a state of complete neutrality in 1943 came too late to gain favourable treatment from the ascendant Allies. Nevertheless, Franco's wartime diplomacy, marked as it was by cold realism and careful timing, had kept his regime from being destroyed along with the Axis powers.

The most difficult period of Franco's regime began in the aftermath of World War II, when his government was ostracized by the newly formed United Nations. He was labeled by hostile foreign opinion the "last surviving Fascist dictator" and for a time appeared to be the most hated of Western heads of state; within his country, however, as many people supported him as opposed him. The period of ostracism finally came to an end with the worsening of relations between the Soviet world and the West at the height of the Cold War. Franco could now be viewed as one of the world's leading anticommunist statesmen, and relations with other countries began to be regularized in 1948. His international rehabilitation was advanced further in 1953, when Spain signed a 10-year military assistance pact with the United States, which was later renewed in more limited form.

Franco's domestic policies became somewhat more liberal during the 1950s and '60s, and the continuity of his regime, together with its capacity for creative evolution, won him at least a limited degree of respect from some of his critics. Franco said that he did not find the burden of government particularly heavy, and, in fact, his rule was marked by absolute self-confidence and relative indifference to criticism. He demonstrated marked political ability in gauging the psychology of the diverse elements, ranging from moderate liberals to extreme reactionaries, whose support was necessary for his regime's survival. He maintained a careful balance among them and largely left the execution of policy to his appointees, thereby placing himself as arbiter above the storm of ordinary political conflict. To a considerable degree, the opprobrium for unsuccessful or unpopular aspects of policy tended to fall on individual ministers rather than on Franco. The Falange state party, downgraded in the early 1940s, in later years became known merely as the "Movement" and lost much of its original quasi-Fascist identity.

Unlike most rulers of rightist authoritarian regimes, Franco provided for the continuity of his government after his death through an official referendum in 1947 that made the Spanish state a monarchy and ratified Franco's powers as a sort of regent for life. In 1967 he opened direct elections for a small minority of deputies to the Parliament and in 1969 officially designated the then 32-year-old prince Juan Carlos, the eldest son of the nominal pretender to the Spanish throne, as his official successor upon his death. Franco resigned his position of premier in 1973 but retained his functions as head of state, commander in chief of the armed forces, and head of the "Movement."

Franco was never a popular ruler and rarely tried to mobilize mass support. But after 1947 there was little direct or organized opposition to his rule. With the liberalization of his government and relaxation of some police powers, together with the country's marked economic development during the 1960s, Franco's image changed from that of the rigorous generalissimo to a more benign civilian elder statesman. Franco's health declined markedly in the late 1960s, yet he professed to believe that he had left Spain's affairs "tied and well-tied" and that after his death Prince Juan Carlos would maintain at least the basic structure of his regime. But after Franco's death in 1975 following a long illness, Juan Carlos moved to dismantle the authoritarian institutions of Franco's system and encouraged the revival of political parties. Spain had made great economic progress during the last two decades of Franco's rule, and within three years of his death the country had become a democratic constitutional monarchy, with a prosperous

economy and democratic institutions similar to those of the rest of western Europe.

BIBLIOGRAPHY. The best biography of Franco is Paul Preston, *Franco* (1993). Another study of his life is J.P. Fusi (Juan Pablo Fusi Aizpurúa), *Franco* (1987). Stanley G. Payne, *The Franco Regime, 1936–1975* (1987), is a detailed analysis of the period.

Franco-American Alliance (Feb. 6, 1778), agreement by France to furnish critically needed military aid and loans to the 13 insurgent American colonies, often considered the turning point of the U.S. War of Independence. Resentful over the loss of its North American empire after the French and Indian War, France welcomed the opportunity to undermine Britain's position in the New World.

Though maintaining a position of neutrality from 1775 to 1777, France was already secretly furnishing the American colonists with munitions and loans. As early as 1776, the Continental Congress had established a joint diplomatic commission—composed of Benjamin Franklin, Silas Deane, and Arthur Lee—to seek recognition and financial aid from the Bourbon monarchy. The colonists' victory at the Battle of Saratoga (Oct. 17, 1777) was the show of strength needed to convince France that the revolutionaries would pursue the war to final victory. Hastening to act before the British peace overtures of the Carlisle Commission could tempt the colonists, the French foreign minister, the comte de Vergennes, succeeded in concluding the alliance the following February.

Two treaties were signed. The first, a treaty of amity and commerce, officially recognized the new country and encouraged Franco-American trade. The second provided for a military alliance against Great Britain and also required recognition of absolute independence for the United States as a condition of peace. In addition, peace could be arrived at only by mutual French and U.S. consent. Finally, France renounced all territorial claims in North America east of the Mississippi River and in Bermuda, and it agreed to guarantee whatever U.S. boundaries existed at the war's end in exchange for U.S. guarantees of French possessions in the West Indies.

The alliance greatly facilitated U.S. independence. The French fleet proceeded to challenge British control of North American waters and, together with troops and arms, proved an indispensable asset in the revolutionaries' victory at the Siege of Yorktown (1781), which ended the war. Later, however, the treaties proved embarrassing to the United States, threatening to involve the country in the French Revolutionary wars. After several years of strained relations, France and the United States agreed to the Treaty of Morfontaine (Sept. 30, 1800) to abrogate both 1778 treaties.

Franco-Cantabrian school, the oldest and most complete of several traditions of Paleolithic (Old Stone Age) art that flourished in southwestern France and the northern Cantabrian Mountains region of Spain between about 40,000 and 10,000 BC. It is called a school because it maintained a coherent development and consistent approach over nearly 30,000 years, covering the two major artistic phases of the Late Paleolithic Period, the Aurignacian and the Magdalenian. It developed in huge limestone caves, such as those at Altamira (*q.v.*) and Lascaux (see Lascaux Grotto), that served as habitation for ancient hunters in central and southern France and northern Spain. The art consists of highly naturalistic small carvings and monumental paintings, engravings, and reliefs.

Magico-religious in inspiration, the art of the Franco-Cantabrian school consists almost

entirely of large numbers of paintings of single, unrelated animals, which seem to have functioned as icons. Some may have played a role in dramatic rituals invoking success in the hunt and in animal fertility. Perhaps because the availability of protected wall space inside the caves favoured the development of graphic arts, Franco-Cantabrian art empha-

sizes the linear over the plastic: sculpture in the round is rare; small carved figurines are freely incised with linear details; and the monumental paintings of animals depend heavily on the rhythm of line and on flat, zonal areas of colour, even in the late Magdalenian phase, when volumes are well expressed. At the same time, the animals depicted by the Franco-Cantabrian school are often lively, sometimes with an overpowering vitality.

Franco-German War, also called FRANCO-PRUSSIAN WAR (July 19, 1870–May 10, 1871), war in which a coalition of German states led by Prussia defeated France. The war marked the end of French hegemony in continental Europe and resulted in the creation of a unified Germany.

Prussia's defeat of Austria in the Seven Weeks' War in 1866 had confirmed Prussian leadership of the German states and threatened France's position as the dominant power in Europe. The immediate cause of the Franco-German War, however, was the candidacy of Prince Leopold of Hohenzollern-Sigmaringen (who was related to the Prussian royal house) for the Spanish throne, which had been left vacant when Queen Isabella II had been deposed in 1868. The Prussian chancellor, Otto von Bismarck, and Spain's *de facto* leader, Juan Prim, persuaded the reluctant Leopold to accept the Spanish throne in June 1870. This move greatly alarmed France, who felt threatened by a possible combination of Prussia and Spain directed against it. Leopold's candidacy was withdrawn under French diplomatic pressure, but the Prussian king William I was unwilling to bow to the French ambassador's demands that he promise to never again allow Leopold to be a candidate for the Spanish throne. Bismarck edited William's telegraphed description of this interview, and on July 14 he published this provocative message (the Ems telegram; *q.v.*), which accomplished his purposes of infuriating the French government and provoking it into a declaration of war.

The French emperor, Napoleon III, declared war on Prussia on July 19, 1870, because his military advisers told him that the French army could defeat Prussia and that such a victory would restore his declining popularity in France. The French were convinced that the reorganization of their army in 1866 had made it superior to the German armies. They also had great faith in two recently introduced technical innovations: the breech-

loading *chassepot* rifle, with which the entire army was now equipped; and the newly invented *mitrailleuse*, an early machine gun. The French generals, blinded by national pride, were confident of victory.

Bismarck, for his part, saw war with France as an opportunity to bring the South German states into unity with the Prussian-led North German Confederation and build a strong German Empire. The Germans had superiority of numbers, since, true to Bismarck's hopes, the South German states (Bavaria, Württemberg, and Baden) regarded France as the aggressor in the conflict and had thus sided with Prussia. An equally important asset was the Prussian army's general staff, which planned the rapid, orderly movement of large numbers of troops to the battle zones. This superior organization and mobility enabled the chief of the general staff, General Helmuth von Moltke, to exploit German superiority in numbers in most of the war's battles.

The efficient German mobilization contrasted with confusion and delay on the French side. Germany was able to deliver 380,000 troops to the forward zone within 18 days of the start (July 14) of mobilization, while many French units reached the front either late or with inadequate supplies. The vast German and French armies that then confronted each other were each grouped into right and left wings. After suffering a check at the Battle of Wörth on Aug. 6, 1870, the commander of the French right (south) wing, Marshal Patrice Mac-Mahon, retreated westward. That same day, about 40 miles (65 km) to the northeast, the commander of the French left wing, Marshal Achille Bazaine, was dislodged from near Saarbrücken and fell back westward to the fortress of Metz. His further retreat was checked by the German right wing in two blundering battles on August 16 and 18, respectively (see Mars-la-Tour and Gravelotte, Battles of), and he then took refuge behind the defenses of Metz indefinitely.

The French right wing, commanded by Mac-Mahon and accompanied by Napoleon himself, attempted to relieve Bazaine but was itself surrounded and trapped by the Germans in a disastrous battle at Sedan (see Sedan, Battle of) on August 31. On September 2, 83,000 encircled French troops, with Napoleon and Mac-Mahon, surrendered. Since Bazaine's army was still bottled up in Metz, the result of the war was virtually decided by this surrender.

French resistance was carried on against desperate odds by a new government of national defense, which assumed power in Paris on Sept. 4, 1870, and proclaimed the deposition of the emperor and the establishment of the Third Republic. On September 19 the Germans began to besiege Paris. Jules Favre, foreign minister in the new government, went to negotiate with Bismarck, but the negotiations were broken off when he found that Germany demanded Alsace and Lorraine. Léon Gambetta, the leading figure in the provisional government, organized new French armies in the countryside after escaping from besieged Paris in a balloon. These engaged but could not defeat the German forces. Bazaine capitulated at Metz with his 140,000 troops intact on October 27, and Paris surrendered on Jan. 28, 1871.

The armistice of January 28 included a provision for the election of a French National Assembly, which would have the authority to conclude a definite peace. This settlement was finally negotiated by Adolphe Thiers and Favre and was signed February 26 and ratified March 1. Between then and the conclusion of the formal Treaty of Frankfurt on May 10, 1871, the republican government was threatened by an insurrection in Paris, in which radicals established their own short-lived government, the Paris Commune. The Commune was suppressed after two months,

and the harsh provisions of the Treaty of Frankfurt were then implemented: Germany annexed Alsace and half of Lorraine, with Metz. Furthermore, France had to pay an indemnity of 5 billion francs and cover the costs of the German occupation of France's northern provinces until the indemnity was paid. The culminating triumph of Bismarck's plans came on Jan. 18, 1871, when King William I of Prussia was proclaimed German emperor at Versailles, the former palace of the kings of France.

The Franco-German War had far-reaching consequences. It established both the German Empire and the French Third Republic. With Napoleon III no longer in power to protect them, the Papal States were annexed by Italy (Sept. 20, 1870), thereby completing that nation's unification. The Germans' crushing victory over France in the war consolidated their faith in Prussian militarism, which would remain a dominant force in German society until 1945. (Additionally, the Prussian system of conscript armies controlled by a highly trained general staff was soon adopted by the other great powers.) Most importantly, Germany's annexation of Alsace-Lorraine aroused a deep longing for revenge in the French people. The years from 1871 to 1914 were marked by an extremely unstable peace, since France's determination to recover Alsace-Lorraine and Germany's mounting imperialist ambitions kept the two nations constantly poised for conflict. Their mutual animosity proved to be the driving force behind the prolonged slaughter on the Western Front in World War I.

Franco-Netherlandish school, also called FLEMISH, FRANCO-FLEMISH, or NETHERLANDS SCHOOL, style of musical composition that dominated European music from c. 1450 to c. 1550 and was so called because during that time most of the leading musicians were born or trained in the Netherlands, Flanders, and northern France. The music of the Franco-Netherlandish school is preeminently vocal and contrapuntal (built on interwoven melodic lines) and was later taken as the ideal of a cappella composition, although it was frequently accompanied by instruments.

The principal genres of the Franco-Netherlandish school included, in sacred music, the mass and, to a somewhat lesser extent, the motet; in secular music, the chanson, or French polyphonic (multipart) song, was dominant. With the masses of Jean d'Ockeghem (*q.v.*) and the late works of Burgundian Guillaume Dufay (*q.v.*), four rather than three voice parts became the norm; in the 16th century, writing in five and six parts became increasingly common. A texture of continuous, spun-out counterpoint was cultivated, varied at times by short chordal sections or passages in three and two voices. By the early 16th century, melodic imitation became common, particularly in the motet.

The mass was the most conservative of the three genres. Motets provided more outlet for expressiveness, and a certain humanism is evident in the careful setting of texts and in the evocation of the meaning of the words; but this was more typical of some composers than others and particularly of Josquin des Prez (*q.v.*), whose work has been noted as marking a transition between the late medievalism inherent in the mystical, often formally intricate sacred music of the previous generation of Franco-Netherlandish composers and the more earthly or human orientation of much later 16th-century music. In the chanson, with its rhythmic melodies of popular cast, there was considerable experimentation, and there evolved a chanson type in which popular elements were fused with contrapuntal techniques and which was marked by clear, short phrases and more "modern" harmonies.

The mid-16th century saw a development of national styles. The Netherlands tradition re-

mained viable but was often given distinct national qualities, as in the motets of the Spanish composer Tomás Luis de Victoria (*q.v.*). Flemish composers such as Orlando di Lasso (*q.v.*) were adept practitioners of several national styles as well as of the international Netherlands style. Netherlands techniques were applied to German and Italian secular song, in Italy resulting in the madrigal, a genre that evolved far away from the Netherlands style and toward the oncoming Baroque era.

Franco-Provençal dialect, any of a group of Romance dialects spoken in east-central France in a region roughly corresponding to Burgundy and in adjacent areas of Italy and Switzerland. Franco-Provençal is purely rural and nonstandardized, young speakers are few, and speech forms are heavily influenced by French, which has been the standard and urban language of the area for several hundred years. Franco-Provençal has no standard or literary language, and its regional and local dialects are extremely diversified; they may be classified into Lyonnais, Neuchâtelois, Dauphinois, Savoyard, and, in Italy, Valle d'Aosta dialect groups.

Linguistically, Franco-Provençal is midway between the Occitan (Provençal) and French languages in its grammar and sound system. In general, vowel sounds are similar to those of Occitan, while consonants conform more nearly to those of French. Except for a brief period when the (now extinct) Franco-Provençal dialect of Geneva was the official language of the Swiss Republic, Franco-Provençal has never had a standard or literary form. Literature is limited; the earliest written material recognized is the Alexander fragment, part of a poem, dating from the 11th or 12th century. There is some controversy as to whether this ought not to be considered a Provençal work with French influences.

François (French personal name): see under Francis.

francolin, any of several species of popular game birds classified as partridges. See partridge.

Franconi, Antonio (b. Aug. 5, 1737, Udine, Republic of Venice [now in Italy]—d. Dec. 6, 1836, Paris, France), impresario, founder of the French circus, and, with Philip Astley, the founder of the modern circus.

A member of a noble Venetian family, Franconi fled to France, where he stayed until 1756, after killing an opponent in a duel. Beginning his circus career as a lion trainer in Lyon, France, he next exhibited trained canaries in France and Spain and in 1773 staged a bullfight in Rouen. He became associated

Franconi, detail of an engraving by Philibert-Louis Debucourt, after a painting by C. Vernet
H. Roger-Viollet

with Astley's Amphitheatre in Paris, and in 1793 he leased the theatre from Astley, renaming it the Amphithéâtre Franconi. Thereafter, Franconi concentrated on expanding and varying his spectacles, especially with trick riding (in which he himself had some skill). He subsequently built the Cirque Olympique de Franconi, management of which he transferred, in 1805, to his sons Henri and Laurent, who likewise gained reputations as notable circus men. His youngest son, Victor, established the first open-air hippodrome in Paris, where he developed a flamboyant circus that especially influenced the Ringling Brothers and Barnum & Bailey circuses in the United States.

Franconia, German FRANKEN, one of the five great stem, or *Stamm* (tribal), duchies—the others being Saxony, Lotharingia (Lorraine), Swabia, and Bavaria—of early medieval Germany. It is now divided between Rhenish Franconia, located in the *Länder* (states) of Rhineland-Palatinate, Baden-Württemberg, and Hesse, and East Franconia, now in the *Länder* of Baden-Württemberg and Bavaria.

The Franks forcibly settled the region from the early 6th century AD, and in the early 8th century the Merovingian dynasty claimed it as a royal demesne (crown land). After the division of the Carolingian empire under the Treaty of Verdun in 843, Franconia became the nucleus of the East Frankish (German) kingdom, and, when the Carolingian line died out, Franconia's duke became the first elected German king as Conrad I (911–918). In 919 the German crown passed to a Saxon dynasty. Franconia remained a royal demesne nurturing no strong ducal dynasty, and their tenure of it provided a support to German kings and Holy Roman emperors. By the 12th century, the name referred only to East Franconia.

The church was always strong in the region, and its bishoprics included the archbishopric of Mainz (in Rhenish Franconia) and Bamberg and Würzburg (East Franconia). After the mid-13th century, the fragmentation of Franconia into secular and ecclesiastical principalities was accelerated. In 1340 these territories organized the *Landfriedensbund* (regional peacekeeping league), which served as the basis of the Franconian *Kreis* (circle, or administrative district) set up in the early 16th century.

In Napoleon's reorganization of Germany, the Franconian region was divided between the kingdoms of Bavaria and Württemberg and the Grand Duchy of Baden. King Louis I of Bavaria revived the use of the name in 1837 by creating the provinces of Upper, Middle, and Lower Franconia, which still form the northwestern corner of the present *Land* of Bavaria.

Franconia Notch, scenic pass between the towering peaks of the Franconia (east) and Kinsman (west) ranges in the White Mountains, northwestern New Hampshire, U.S. The pass is located in Grafton county just north of North Woodstock and is about 8 miles (13 km) long. An impressive example of glacial action, the pass includes at its southern end the Flume, a narrow gorge 70 feet (21 m) deep that extends along the flank of Mount Liberty (4,460 feet [1,359 m]). Cannon Mountain (4,180 feet [1,274 m]), which is 5 miles (8 km) south of Franconia Village, has skiing facilities and an aerial tramway to its summit. One of the state's most famous landmarks, the Old Man of the Mountain (also called the Great Stone Face or the Profile), was located on Cannon Mountain. Comprising ledges of granite (48 feet [15 m] high) shaped like a face on the mountainside 1,200 feet (366 m) above Profile Lake, it collapsed in 2003 despite numerous efforts to protect it. Echo Lake, at the head of

the Notch and surrounded on three sides by mountains, is noted for boating, fishing, and swimming. The Pemigewasset River rises in the Notch and follows the pass, from which it flows southward for 60 miles (95 km) to join the Winnepesaukee River to form the Merrimack. The area, made a state park in 1928, is traversed by the Appalachian National Scenic Trail.

Franconian Forest, German FRANKENWALD, forested highland in extreme north-eastern Bavaria *Land* (state), east-central Germany. It forms a physical and geological link between the highlands of the Fichtel Mountains and the Thuringian Forest. About 30 miles (50 km) long, the forest descends gently north and east toward the Saale River but more precipitously west to the Bavarian Plain. Its highest point is Mount Döbra (2,608 feet [795 m]). Along the centre lies the watershed between the Main and the Saale basins and between the Rhine and the Elbe systems. The principal tributaries of the Main rising in the forest are the Rodach and the Hasslach; of the Saale, the Selbitz. Small hamlets lie in clearings in the heath, bog, and woods of the Franconian Forest. The chief city is Hof, to the east. Kulmbach, Kronach, and Bayreuth lie to the west.

Franju, Georges (b. April 12, 1912, Fougères, France—d. Nov. 5, 1987, Paris), French motion-picture director noted for his short documentary films.

In 1932 Franju found work on the sets of Paris music halls while he studied theatre decor. Franju met Henri Langlois in 1934. In that year the two men directed the short *Le Métro*, and in 1935 they started a film magazine and founded *Le Cercle du Cinéma*, a film club. Franju and Langlois founded the Cinémathèque Française (the French film archives) in 1937, and Franju served as executive secretary of the Fédération Internationale des Archives du Film (FLAF), the international federation of film archives, from 1938 to 1945.

In 1949 Franju established himself as a leading figure of the French cinema with the release of his documentary *Le Sang des bêtes* (*The Blood of the Beasts*), the subject of which is a Parisian slaughterhouse. It was followed by at least a dozen highly praised documentary shorts during the next decade, including *Hôtel des Invalides* (1951), *Monsieur et Madame Curie* (1953), *Le Saumon atlantique* (1955; "The Atlantic Salmon"), and *Notre Dame—Cathédrale de Paris* (1957). These documentaries are notable for their intensely personal expression and an emotionally complex presentation of their subjects. Franju's feature films after that—including *La Tête contre les murs* (1958; "Head Against the Wall"), *Judex* (1963), and *L'Homme sans visage* (1974; "The Man Without a Face")—were not as successful as his earlier works.

Frank, member of a Germanic-speaking people who invaded the Western Roman Empire in the 5th century AD. Dominating present-day northern France, Belgium, and western Germany, the Franks established the most powerful Christian kingdom of early medieval western Europe. The name France (Francia) is derived from their name.

The Franks emerged into recorded history in the 3rd century AD as a Germanic tribe living on the east bank of the lower Rhine River. Linguistically, they belonged to the Rhine-Weser group of Germanic speakers. At this time they were divided into three groups: the Salians, the Ripuarians, and the Chatti, or Hessians. These branches were related to each other by language and custom, but politically they were independent tribes. In the mid-3rd century the Franks tried unsuccessfully to ex-

pand westward across the Rhine into Roman-held Gaul. In the mid-4th century the Franks again attempted to invade Gaul, and in 358 Rome was compelled to abandon the area between the Meuse and Scheldt rivers (now in Belgium) to the Salian Franks. During the course of these drawn-out struggles, the Franks were gradually influenced by Roman civilization. Some Frankish leaders became Roman allies (*foederati*) in the defense of the Roman frontier, and many Franks served as auxiliary soldiers in the Roman army.

The Vandals launched a massive invasion of Gaul in 406, and in the ensuing decades the Franks took advantage of the overstrained Roman defenses. They solidified their hold on what is now Belgium, took permanent control of the lands immediately west of the middle Rhine River, and edged into what is now northeastern France. The firm establishment of the Franks in northeastern Gaul by the year 480 meant that both the former Roman province of Germania and part of the two former Belgic provinces were lost to Roman rule. The small Gallo-Roman population there became submerged among the German immigrants, and Latin ceased to be the language of everyday speech. The extreme limit of Frankish settlement at this time is marked by the linguistic frontier that still divides the Romance-speaking peoples of France and southern Belgium from the Germanic-speaking peoples of northern Belgium, The Netherlands, and Germany.

In 481/482 Clovis I succeeded his father, Childeric, as the ruler of the Salian Franks of Tournai. In the following years Clovis compelled the other Salian and Ripuarian tribes to submit to his authority. He then took advantage of the disintegration of the Roman Empire and led the united Franks in a series of campaigns that brought all of northern Gaul under his rule by 494. He stemmed the Alemannic migrations into Gaul from east of the Rhine, and in 507 he drove southward, subduing the Visigoths who had established themselves in southern Gaul. A unified Frankish kingdom in northern Gaul was thus established and secured. Clovis converted to Catholicism, and the mass adoption of orthodox Christianity by the Franks further served to unite them into one people. It also won them the support of the orthodox clergy and the remaining Gallo-Roman elements in Gaul, since most other Germanic tribes had adopted Arianism.

Clovis belonged to the Merovingian dynasty, and under his successors the Merovingians were able to extend Frankish power east of the Rhine. The Merovingian dynasty ruled the Frankish territories until they were displaced by the Carolingian family in the 8th century. The Carolingian Charlemagne (Charles the Great, reigned 768–814) restored the Western Roman Empire in cooperation with the papacy and spread Christianity into central and northern Germany. His empire disintegrated by the mid-9th century.

In succeeding centuries the people of the west Frankish kingdom (France) continued to call themselves Franks, although the Frankish element merged with the older population. In Germany the name survived as Franconia (Franken), a duchy extending from the Rhineland east along the Main River.

Frank, Anne, in full ANNELIES MARIE FRANK (b. June 12, 1929, Frankfurt am Main, Ger.—d. March 1945, Bergen-Belsen concentration camp, near Hannover), young Jewish girl whose diary of her family's two years in hiding during the Nazi occupation of The Netherlands became a classic of war literature.

Early in the Nazi regime of Adolf Hitler, Anne's father, Otto Frank (1889–1980), a German businessman, took his wife and two daughters to live in Amsterdam. In 1941, after German forces occupied The Netherlands,

Anne was compelled to transfer from a public to a Jewish school. Faced with deportation (supposedly to a forced-labour camp), the Franks on July 9, 1942, went into hiding with four other Jews in the back-room office and warehouse of the father's food-products business. With the aid of food and other supplies smuggled in by a few Gentile friends, they lived confined to their secret annex until Aug. 4, 1944, when the Gestapo, acting on a tip from Dutch informers, discovered them.

The family was transported to the concentration camp at Auschwitz in Poland, where Anne's mother died in 1945. Anne and her sister were transferred to Bergen-Belsen and died there of typhus. Otto Frank was found hospitalized at Auschwitz when it was liberated by Russian troops.

Friends who had searched the annex after the family's departure later gave Otto Frank the papers left behind by the Gestapo; among them he found Anne's diary. He had it published in 1947 as *Het Achterhuis* (Eng. trans., *The Diary of a Young Girl*). Precocious in style and insight, it traces her emotional growth amid adversity and records her assertion that "In spite of everything I still believe that people are really good at heart."

The diary has been translated into more than 50 languages and has been widely read. A new English translation, published in 1995, contained material that was edited out of the original version, making the new work nearly a third longer. The Frank family's hiding place on the Prinsengracht Canal in Amsterdam has become a museum.

Frank, Hans (b. May 3, 1900, Karlsruhe, Ger.—d. Oct. 16, 1946, Nürnberg), German politician and lawyer who served as governor-general of Poland during World War II.

Frank fought in World War I, studied economics and jurisprudence, and in 1921 joined the German Workers' Party (which became the Nazi Party). He eventually became the party's chief legal counsel and Hitler's personal lawyer. After the Nazis came to power in Germany in 1933, Frank was appointed to a variety of important posts, including president of the Reichstag and minister of justice in the Nazi government.

After the German invasion of Poland in 1939, Frank was appointed governor-general, becoming the supreme chief of occupied Poland's civil administration. An enthusiastic proponent of Nazi racist ideology, Frank ordered the execution of hundreds of thousands of Poles, the wholesale confiscation of Polish property, the enslavement of hundreds of thousands of Polish workers who were shipped to Germany, and the herding of most of Poland's Jews into ghettos as a prelude to their extermination. Frank remained governor-general until the war's end, although Hitler stripped him of his other posts in 1942. He was captured by U.S. Army troops on May 4, 1945, and was indicted for trial before the International Military Tribunal at Nürnberg. He was found guilty of war crimes and crimes against humanity and on Oct. 1, 1946, was sentenced to hang.

Frank, Ilya Mikhaylovich (b. Oct. 23 [Oct. 10, Old Style], 1908, St. Petersburg, Russia—d. June 22, 1990, Soviet Union?), Soviet winner of the Nobel Prize for Physics in 1958 jointly with Pavel A. Cherenkov and Igor Y. Tamm, also of the Soviet Union. He received the award for his work in explaining the Cherenkov effect.

In 1934 Cherenkov discovered that light is emitted by charged particles traveling at very high speeds. This discovery resulted in the development of new methods for detecting and measuring the velocity of high-speed particles and became of great importance for research in nuclear physics. Frank and Tamm provided the theoretical interpretation of this effect in 1937.

Frank's work also included collaboration with Cherenkov and Tamm in research on electron radiation, for which each was awarded the Stalin Prize in 1946. Frank also specialized in the study of gamma rays and neutron beams. He became head of the department of physics at the University of Moscow in 1944 and was made a member of the Academy of Sciences of the U.S.S.R. in 1946.

Frank, Jacob, original name JACOB LEIBOWICZ (b. 1726, in Berezanka or Korolowka, Galicia, Pol. [now in Ukraine]—d. Dec. 10, 1791, Offenbach, Hessen [Germany]), Jewish false messiah who claimed to be the reincarnation of Shabbetai Tzevi (1626–76). The most notorious of the false messiahs, he was the founder of the antirabbinical Frankist, or Zoharist, sect.

Frank often traveled in the Balkans and there met followers of Shabbetai. An uneducated visionary, he appealed to many who awaited the resurrection of Shabbetai. In about 1751 he proclaimed himself the messiah and four years later, in Poland, formed a sect that held that certain elect persons are exempt from the moral law. This sect abandoned Judaism for a "higher Torah" (Jewish Law) based on the *Zohar*, which was the most important work in the Kabbala, the Jewish mystical movement. Hence its members also called themselves Zoharists. Their practices, including orgiastic, sexually promiscuous rites, led the Jewish community to ban them as heretics in 1756. Protected by Roman Catholic authorities, who saw in them a means of converting the Jews, the Frankists debated with representatives of the rabbinate and claimed that the Talmud, the rabbinical compendium of law and commentary, should be discarded as blasphemous. They were also partly responsible for the revival of the canard that the Jews use Christian blood for Passover rituals.

In the meantime, to preserve his following, Frank publicly committed his supporters to mass baptism and was himself baptized in Warsaw, with Augustus III, king of Poland, acting as his godfather. The Frankists, however, continued their sectarian ways. As a result, the Inquisition imprisoned Frank in the fortress of Czeszochowa (1760).

Freed by the conquering Russians in 1773, he eventually settled in Offenbach, dubbing himself baron. His many followers supported him in a manner befitting the nobility. Upon Frank's death, he was succeeded by his daughter Eve, who eventually spent all the money that the Frankists had given her, leading to her arrest for bankruptcy. She died in 1816. The sect deteriorated rapidly, and descendants of those members who were baptized merged with the Roman Catholic population.

Frank, Karl Hermann (b. Jan. 24, 1898, Karlsbad, Bohemia, Austria-Hungary [now Karlovy Vary, Czech Republic]—d. May 22, 1946, Prague, Czechoslovakia), German Nazi of the Sudetenland who became the virtual ruler of Bohemia and Moravia and ordered the destruction of the Czech village of Lidice.

Frank studied at the University of Prague and was a bookseller before he turned to politics. A Sudeten "irredentist," he agitated for the return to Germany of the German-speaking provinces of Czechoslovakia and joined the Sudeten German Party when it was organized. Rising to the party directorate, he represented the Sudeten Germans in the Czechoslovak parliament (1935–38). After Adolf Hitler annexed the Sudetenland following the Munich agreement of 1938, the party was absorbed by the Nazis, and in 1939 Frank was named state secretary to the Reich protector for Bohemia and Moravia and concurrently held the rank of minister. After Reinhardt Heydrich, then Reich protector, was assassinated by Czechoslovak patriots in 1942, Frank ordered the execution of the male population of the villages of Lidice and Lezaky in ret-

tribution. He held actual power in Bohemia and Moravia, though he was nominally subordinate to the new Reich protector, Wilhelm Frick.

Frank surrendered to the U.S. Army near Pilsen on May 9, 1945. Convicted by a People's Court in Prague for the Lidice massacre as well as for other war crimes, he was hanged in the Pankrac Prison courtyard.

Frank, Leonhard (b. Sept. 4, 1882, Würzburg, Ger.—d. Aug. 18, 1961, Munich, W.Ger.), German Expressionist novelist and playwright who used sensationalism and a compact and austere prose to dramatize a favourite theme—the destruction of the individual spirit by bourgeois society.

After studying painting in Munich in 1904 and working as a commercial artist, Frank turned to literature. In 1914 his open opposition to World War I forced him to flee to Switzerland. The same year he published his first book, *Die Räuberbande* (1914; *The Robber Band*). The story of rebellious young boys who seek to create the ideal society but end up as "good citizens," it embodies the main theme of his writings—the humorous exposure and realistic portrayal of the narrowness of the middle classes. While in Switzerland he also published *Die Ursache* (1915; *The Cause of the Crime*), an attack on repressive educational systems, and *Der Mensch ist gut* (1917; "Man Is Good"), a revolutionary denunciation of war.

Frank returned to Germany in 1918. His belief in the necessity of the overthrow of capitalism and the establishment of socialism was expressed in his novel *Der Bürger* (1924; *A Middle-Class Man*) and in *Das Ochsenfurter Männerquartett* (1927; *The Singers*). During the same period he wrote his masterpiece, *Karl und Anna* (1926; *Carl and Anna*), a realistic, if sentimental, account of a soldier who seduces his comrade's wife.

In 1933 Frank's books were banned and burned by the Nazis, and he immigrated again to Switzerland. From there he went to Paris, where in 1940 he was confined in an internment camp. After several escapes and reinternments, he fled to the United States. He returned to Germany in 1950 and two years later published his last important work, the thinly disguised autobiographical novel *Links, wo das Herz ist* (1952; *Heart on the Left*).

Frank, Robert (b. Nov. 9, 1924, Zürich, Switz.), one of the most influential photog-

"Chicago, 1956," by Robert Frank

Robert Frank from *The Americans*

rappers of the mid-20th century, noted for ironic renderings of American life.

Frank became a professional industrial photographer at the age of 22 and in the 1940s became a successful fashion photographer for *Harper's Bazaar* magazine in Paris. He felt, however, that the scope of the work was too limited. He abandoned fashion photography about 1948 and went to the United States and then to Peru to explore the expressive possibilities of the 35-mm camera.

After photographing in Europe in 1950 and 1953, Frank returned to the United States. There in 1955 and 1956 he made a series of photographs ultimately published as *The Americans* (1959), a photographic book with a text by the American novelist Jack Kerouac. Photographs such as "Chicago, 1956" in *The Americans* reveal Frank's mature style, which is characterized by bold composition and ironic, sometimes bitter, social commentary. Their publication established Frank as a major creative photographer.

After 1959 he turned primarily to cinematography. His first motion picture, *Pull My Daisy* (1959), was based on a play by Kerouac and featured the poets Allen Ginsberg, Gregory Corso, and Peter Orlovsky, as well as the painter Larry Rivers. *Pull My Daisy* was a critical success, but Frank's later films were not so well received.

Frankel, Zacharias (b. Sept. 30, 1801, Praguc, Bohemia, Austrian Empire [now in Czech Republic]—d. Feb. 13, 1875, Breslau, Ger. [now Wrocław, Pol.]), rabbi and theologian, a founder of what became Conservative Judaism.

After graduation from the University of Budapest in 1831, Frankel served as rabbi in several German communities, becoming chief rabbi of Dresden in 1836. During this period he developed a theology that he called positive-historical Judaism. It differed from Orthodoxy in its acceptance of scientific and historical research and in its willingness to make some liturgical changes. It differed from Reform Judaism in that it sought to maintain traditional customs and adhere to the national aspects of Judaism.

In 1854 Frankel was chosen president of the newly organized Jewish theological seminary at Breslau, which became and remained one of the most important modern European institutions for the training of rabbis until the Nazi period. Through the faculty and students of Breslau seminary, Frankel's viewpoint became highly influential in central Europe. In the 20th century it took root in the United States, where, under the name of Conservative Judaism, it attained its greatest growth. Frankel's first major work, *Die Eidesleistung der Juden* (1840; "Oath-Taking by Jews"), attacked discrimination against Jews who testified in courts in Saxony. It effectively helped disprove the notion that Jews were untrustworthy in swearing oaths. Frankel also published *Vorstudien zur Septuaginta* (1841; "Preliminary Studies in the Septuagint"), in which he, the only major 19th-century Jewish scholar who wrote on the Septuagint (the first Greek version of the Old Testament), sought to show the necessary connection between Talmudic and Septuagintic exegesis. It is considered a classic work. Two works he wrote in Hebrew, *Darke ha-Mishnah* (1859; "Introduction to the Mishna") and *Mebo ha-Yerushalmi* (1870; "Introduction to the Palestinian Talmud"), were major contributions to Jewish religious thought.

Frankenstein, the title character in Mary Wollstonecraft Shelley's novel *Frankenstein*, the prototypical "mad scientist" who creates a monster by which he is eventually killed. The name Frankenstein has become popularly at-

tached to the creature itself, who has become the best-known monster in the history of motion pictures.

Shelley's novel, *Frankenstein; or, the Modern Prometheus* (1818), is a combination of Gothic horror story and science fiction. The book tells the story of Victor Frankenstein, a Swiss student of natural science who creates an artificial man from pieces of corpses and brings his creature to life. Though it initially seeks affection, the monster inspires loathing in everyone who meets it. Lonely and miserable, the monster turns upon its creator, who eventually loses his life.

The first Frankenstein film was produced by Thomas Edison in 1910. Two German films, *The Golem* (1914) and *Homunculus* (1916), dealt with a similar theme derived from Jew-

Boris Karloff as the monster in the motion picture *Frankenstein*, 1931

ish folklore. The Hollywood film *Frankenstein* (1931), with Boris Karloff as the monster, was based as much on *The Golem* as on Shelley's novel. This film was a great success and was followed by dozens of variations on the Frankenstein story in films such as *Bride of Frankenstein* (1935) and *Frankenstein Conquers the World* (1969), a Japanese-made version. The character of the monster has also been used as a vehicle for easy humour—as in *Abbott and Costello Meet Frankenstein* (1948) and Mel Brooks's *Young Frankenstein* (1974).

Frankenthal, city, Rhineland-Palatinate Land (state), southwestern Germany. It lies just northwest of Mannheim. First mentioned as Franconodal, a fishing settlement, in 772, it was the site of a powerful Augustinian monastery from 1119 until it passed to the Palatinate in 1562 and was settled by Dutch Protestant refugees. It was chartered in 1577. Although it suffered heavily in the Thirty Years' War and was devastated in 1689, it recovered to become famous for the porcelain manufactured there from 1755 to 1794. Severely damaged in World War II, Frankenthal has been rebuilt. Notable landmarks are the ruins of the 12th-century abbey church and two town gates dating from 1770 and 1772, respectively. The city's economy now relies largely on chemicals and metalworking. Pop. (1995 est.) 47,609.

Frankenthaler, Helen (b. Dec. 12, 1928, New York City), American Abstract Expres-

"Ocean Desert," acrylic on canvas by Helen Frankenthaler, 1975; in the Museum of Fine Arts, Boston

By courtesy of the Museum of Fine Arts, Boston, gift of Mildred and Herbert Lee

sionist painter whose brilliantly coloured canvases have been much admired for their lyric qualities.

Her father, Alfred Frankenthaler, was a New York Supreme Court justice. She studied under the Mexican painter Rufino Tamayo in high school; at the Dalton School, New York City; and at Bennington College, Bennington, Vt. After graduation in 1949, she returned to New York City, where she was impressed by the works of Arshile Gorky and Jackson Pollock. Frankenthaler joined the group of young artists that became known as the second generation of Abstract Expressionists. Her first one-woman show was held in New York City in 1951. In one of her major early works, the seminal "Mountains and Sea" (1952), she created diaphanous colour by means of thinned-down oils that she allowed to soak into the raw (unprimed) canvas. This technique, known as the stain technique, was in strong contrast to the use of impasto that characterized most Abstract Expressionist painting, and it seriously influenced the colour-field painters Morris Louis and Kenneth Noland. In the early 1960s Frankenthaler began to use acrylics, and the areas of raw canvas began to assume much greater spatial significance. Her later exhibitions included lithographs and works on paper. Although not abstractions of nature, many of her paintings, such as "Ocean Desert" (1975), embody a strong feeling of landscape.

From 1958 to 1971 she was married to the American painter Robert Motherwell.

Frankfort, the capital (since 1792) of Kentucky, U.S., and seat of Franklin county. It was founded in 1786 on the Kentucky River by General James Wilkinson. Frankfort is a

State Capitol, Frankfort, Ky.

Art Resource

corruption of the name Frank's Ford, which was derived from an incident in which Stephen Frank, a frontiersman, was killed (1780) in an Indian skirmish at a local fording place on the river. Twice during Frankfort's early history the capitol was burned, and at both times the larger cities of Louisville, 50 miles (80 km) west, and Lexington, 26 miles (42 km) southeast, attempted to usurp the seat of state government; Frankfort was retained, however, because of its central location. During the American Civil War it was occupied briefly (1862) by Confederate general Braxton Bragg. The city was flooded in 1937 and suffered widespread damage.

Frankfort is a trading centre for the Bluegrass region, producing tobacco, corn (maize), and Thoroughbred horses. Its manufactures include bourbon whiskey, candy, furniture, electronic parts, machinery, and textiles. Kentucky State University (1886) was originally founded for blacks. The State Capitol (1910) is crowned by a dome 212 feet (65 m) high. The city's historic buildings include the Old Capitol (1827–30) now housing the Kentucky Historical Society, Liberty Hall (c. 1796), and the Orlando Brown House (1835). The graves of pioneer Daniel Boone and his wife Rebecca are in the Frankfort Cemetery. Inc. city, 1839. Pop. (1994 est.) 28,708.

Frankfort, Henri (b. Feb. 24, 1897, Amsterdam, Neth.—d. July 16, 1954, London, Eng.), American archaeologist who completed a well-documented reconstruction of ancient Mesopotamian culture, established the relation between Egypt and Mesopotamia, and discovered much new information on both civilizations.

Frankfort's university studies in history, hieroglyphics, and archaeology were complemented by excavations in Egypt (1922) and travel through the Balkans and the Middle East (1922, 1924–25). From this period he produced *Studies in Early Pottery of the Near East*, 2 vol. (1924–27). After directing excavations in Egypt at Abydos, Tell el-Amarna, and Armant (1925–29), he led the expedition of the Oriental Institute (University of Chicago) to Iraq (1929–37) and published *Cylinder Seals: A Documentary Essay on the Art and Religion of the Ancient Near East* (1939).

As professor at the University of Chicago and head of the Warburg Institute of the University of London (1938–54), he brought his far-reaching interests to bear on comparative studies of Egypt and Mesopotamia. He approached archaeological materials with a keen regard for anthropological, aesthetic, and philosophical problems as well as a rare understanding of religious phenomena. His other works include *Kingship and the Gods: A Study of Ancient Near Eastern Religion as the Integration of Society and Nature* (1948), *Ancient Egyptian Religion: An Interpretation* (1948), and *The Art and Architecture of the Ancient Orient* (1954).

Frankfurt am Main, Germany FRANKFURT ON THE MAIN, largest city of Hesse (state), western Germany. The city lies along the Main River about 19 miles (30 km) upstream from its confluence with the Rhine River at Mainz.

There is evidence of Celtic and Germanic settlements in the city dating from the 1st century BC, as well as Roman remains from the 1st and 2nd centuries AD. The name Frankfurt ("Ford [Passage, Crossing] of the Franks") probably arose about AD 500, when the Franks drove the Alemanni south, but the first written mention of Franconofurt stems from Charlemagne's biographer, Einhard, in the late 8th century. The Pfalz (imperial castle)

The Römer, the old town hall, Frankfurt am Main, Ger.

The J. Allan Cash Photolibrary, London

served as an important royal residence of the East Frankish Carolingians from the 9th century through later medieval times. In the 12th century the Hohenstaufen dynasty erected a new castle in Frankfurt and walled the town. The Hohenstaufen ruler Frederick Barbarossa was elected king there in 1152, and in 1356 the Golden Bull (the constitution of the Holy Roman Empire) designated Frankfurt as the permanent site of the election of the German kings.

Frankfurt am Main was a free imperial city from 1372 until 1806, when Napoleon I made it the seat of government for the prince-primate of the Confederation of the Rhine. In 1810 the city became the capital of the Grand Duchy of Frankfurt created by Napoleon. From 1815, when Napoleon fell, Frankfurt was again a free city, and in 1848–49 the Frankfurt National Assembly was held there. From 1816 to 1866 the city was the seat of the German Bundestag (Federal Diet) and thus the capital of Germany. After the Seven Weeks' War in 1866, Frankfurt was annexed by Prussia, thereby ending its free-city status. It was only after its integration into a united Germany that Frankfurt developed into a large industrial city.

Until World War II, Frankfurt's Old Town, which had grown up around the imperial castle, was the largest medieval city still intact in Germany. The Old Town was mostly destroyed by Allied bombing campaigns in 1944, however, and was subsequently rebuilt with multistory office buildings and other modern structures. The Römer (the old town hall) and two other gabled houses along Römerberg Square are among the city's most famous old structures. Other historical landmarks include the 155-foot- (47-metre-) tall Eschenheimer Tower (1400–28); the red sandstone cathedral, which was dedicated to St. Bartholomew in 1239; and the Church of St. Paul (Paulskirche), which was the meeting place of the Frankfurt National Assembly.

International trade fairs have been held in Frankfurt since 1240, and the city is now a

leading commercial, financial, and high technology centre. There is an important stock exchange (first established in 1585), and Frankfurt was the site from which the Rothschild family started its international banking empire. Frankfurt's annual book, automobile, and computer fairs are popular events. The city's manufactures include automobiles, machinery, chemical and pharmaceutical products, printing materials, leather goods, and foodstuffs. The city is traditionally known for its production of high-quality sausages (hence *Frankfurters*).

Frankfurt has long been a key stopping point for river, rail, and road traffic from Switzerland and southern Germany northward along the Rhine River to the Ruhr region and across the Main River to north-central Germany. It is still the chief traffic hub for western Germany and has also been an important inland shipping port since the canalization of the Main River in the 1880s. The Rhein-Main airport nearby is the largest airport in Germany and one of the busiest in Europe.

Johann Wolfgang Goethe University of Frankfurt (1914) is one of the largest institutions of higher education in Germany. The Frankfurt am Main City Zoological Garden is one of the nation's finest zoos. Among the city's other attractions are the Städel Art Institute, the Senckenberg museum of natural history, and the Liebighaus museum of sculpture. J.W. von Goethe's birthplace was burned to the ground in World War II but has since been restored. Adjoining it is the Goethe Museum and Library, one of the city's chief attractions. Pop. (1998 est.) 643,469.

Frankfurt an der Oder, city, Brandenburg Land (state), eastern Germany. It lies on the west bank of the Oder River opposite the Polish town of Słubice, which before 1945 was the Frankfurt suburb of Dammvorstadt. An early medieval settlement of Franconian colonists and traders, Frankfurt was chartered in 1253 and joined the Hanseatic League in 1368. In 1379 it received the right to free navigation on the Oder, and later its fairs became important. A university founded there in 1506 was transferred to Cottbus from 1516 to 1539. Dissolved during the Thirty Years' War and later reestablished by Frederick William of Brandenburg, the Great Elector, the school was finally removed to Breslau (now Wrocław, Pol.) in 1811. A new university, European University Viadrina, was established after unification.

Frankfurt was besieged by Soviet forces and seriously damaged in World War II but was afterward reconstructed. The city's notable landmarks include the 15th-century Church of St. Mary (Marienkirche), the town hall (remodeled 1607–09), the Church of St. Nicholas (Nikolaikirche), the old university buildings, and the Kleist Museum, which is now a memorial to the poet Heinrich von Kleist and which contains a large library.

Frankfurt is a busy road and rail transit point for trade with eastern Europe, and it has an inland harbour on the Oder about 6 miles (10 km) north of that river's junction with the Oder-Spree Canal. Machinery, furniture, foodstuffs, shoes, and textiles are manufactured. Pop. (1998 est.) 77,891.

Frankfurt National Assembly, formally GERMAN NATIONAL ASSEMBLY, GERMAN FRANKFURTER NATIONALVERSAMMLUNG, or DEUTSCHE NATIONALVERSAMMLUNG (May 1848–June 1849), German national parliament that tried and failed to create a united German state during the liberal Revolutions of 1848.

A preliminary parliament (*Vorparlament*) met in Frankfurt am Main in March 1848 at the instigation of liberal leaders from all the German states (including Austria), and it called for the election of a national assembly (*Nationalversammlung*). The elections were duly held, though the electoral laws and meth-

ods varied considerably from state to state, and on May 18 the National Assembly met in the Church of St. Paul (Paulskirche) in Frankfurt. Moderate liberals held a majority in the assembly, though the entire political spectrum was represented among its deputies. The liberal Heinrich von Gagern was elected president of the parliament.

The Frankfurt National Assembly spent much time debating various plans for a unified Germany, but it also had to decide on immediate practical problems, such as the nature of the executive power and Germany's territorial extent. Archduke John of Austria, a comparatively liberal uncle of the Austrian emperor Ferdinand, was appointed regent of Germany and head of the assembly's (putative) executive power on June 29. Yet it soon became clear that the executive appointed by the Frankfurt Assembly had no power except such as was granted to it by the governments of the individual states. The Frankfurt Assembly attempted to take over the conduct of a war with Denmark concerning the duchies of Schleswig and Holstein; but Prussia, ignoring the assembly, abruptly concluded the war in August. By this time, Prussia's Frederick William IV had lost all patience with the liberals and had turned increasingly toward ultraconservative advisers. In Austria the emperor Ferdinand had abdicated in favour of his nephew Francis Joseph, who likewise relied on conservative ministers.

The Frankfurt National Assembly was finally able to adopt a proposed constitution for Germany on March 28, 1849. This document provided for universal suffrage, parliamentary government, and a hereditary emperor. Germany was to have a unified monetary and customs system but would maintain the internal autonomy of the constituent German states.

But in the meantime, Austria had proclaimed a new constitution (March 4, 1849), which mandated that either the entire Austrian Empire or none of it would enter the new Germany. This was a blow to those liberals who had hoped for a Germany that would include Austria, or at least its German-speaking provinces. The initiative thus passed to those who wanted to exclude Austria from a Germany that would be under the leadership of Prussia. Accordingly, when the election of an emperor took place in the National Assembly on March 28, 290 votes were cast for Frederick William of Prussia against 248 abstentions. On April 3 the king received a deputation from the assembly that came to offer him the crown. The offer was refused. Frederick William was too deeply conservative to receive a German imperial crown from any hands except those of the other German princes. Prussia also rejected the proposed constitution.

Without the support of either Prussia or Austria, the Frankfurt Assembly could not now survive. By May, Gagern's ministry had broken up, and the majority of the deputies were ordered home by the governments of their respective states. The rump that remained was forced to move to Stuttgart and was finally dispersed on June 18 by Württemberg troops and police. The Frankfurt Assembly and the revolutions that had inspired it were over.

Frankfurt School, group of researchers associated with the Institute for Social Research in Frankfurt am Main, Ger., who applied Marxism to a radical interdisciplinary social theory. The Institute for Social Research (Institut für Sozialforschung) was founded by Carl Grünberg in 1923 as an adjunct of the University of Frankfurt; it was the first Marxist-oriented research centre affiliated with a major German university. Max Horkheimer took over as director in 1930 and recruited many tal-

ented theorists, including T.W. Adorno, Erich Fromm, Herbert Marcuse, and Walter Benjamin.

The members of the Frankfurt School tried to develop a theory of society that was based on Marxism and Hegelian philosophy but which also utilized the insights of psychoanalysis, sociology, existential philosophy, and other disciplines. They used basic Marxist concepts to analyze the social relations within capitalist economic systems. This approach, which became known as "critical theory," yielded influential critiques of large corporations and monopolies, the role of technology, the industrialization of culture, and the decline of the individual within capitalist society. Fascism and authoritarianism were also prominent subjects of study. Much of this research was published in the institute's journal, *Zeitschrift für Sozialforschung* (1932–41; "Journal for Social Research").

Most of the institute's scholars were forced to leave Germany after Adolf Hitler's accession to power (1933), and many found refuge in the United States. The Institute for Social Research thus became affiliated with Columbia University until 1949, when it returned to Frankfurt. In the 1950s the critical theorists of the Frankfurt School diverged in several intellectual directions. Most of them disavowed orthodox Marxism, though they remained deeply critical of capitalism. Marcuse's critique of what he perceived as capitalism's increasing control of all aspects of social life enjoyed unexpected influence in the 1960s among the younger generation. Jürgen Habermas emerged as the most prominent member of the Frankfurt School in the post-war decades, however. He tried to open critical theory to developments in analytic philosophy and linguistic analysis, structuralism, and hermeneutics.

frankfurter, also called **WIENER**, or (in the United States) **HOT DOG**, highly seasoned sausage, traditionally of mixed pork and beef. Frankfurters are named for Frankfurt am Main, Ger., the city of their origin, where they were sold and eaten at beer gardens.

Frankfurters were introduced in the United States in about 1900 and quickly came to be considered an archetypal American food. The first so-called hot-dog stand, selling the sausages as a sandwich on what was to become the standard long hot-dog bun, was opened at Coney Island, New York, in 1916. The hot dog remained popular in the United States throughout the 20th century, being especially associated with barbecues, picnics, and athletic events.

Frankfurters are sold ready-cooked and lightly smoked, either loose, vacuum-packed, or canned, to be heated by grilling, steaming, or gentle, brief boiling (frying makes them tough). The German and Austrian frankfurter also is known as a *wurstchen*, or "little sausage," and many varieties of these sausages exist. In Germany and Austria, frankfurters are eaten warm with sauerkraut and cold, if lightly smoked, with potato salad. Nutritionally, the typical American frankfurter is about 55 percent water, 28–30 percent fat, and 12–15 percent protein. All-beef or turkey frankfurters are also produced, as are versions with reduced fat content. Most commercially marketed frankfurters contain nitrates or nitrites of sodium or potassium, which prevent the growth of the botulism-causing bacterium, *Clostridium botulinum*, and preserve the meat's characteristic reddish colour, which would otherwise be lost in processing.

Frankfurter, Felix (b. Nov. 15, 1882, Vienna, Austria-Hungary—d. Feb. 22, 1965, Washington, D.C., U.S.), associate justice of the United States Supreme Court (1939–62), a

noted scholar and teacher of law, who was in his time the high court's leading exponent of the doctrine of judicial self-restraint. He held that judges should adhere closely to precedent, disregarding their own opinions, and decide only "whether legislators could in reason have enacted such a law."

Frankfurter was the son of a Jewish merchant who left Vienna for New York in 1893. Young Frankfurter was educated at the City College of New York and at the Harvard Law School, where he later taught (1914–39). He served as assistant to Henry L. Stimson when Stimson was U.S. attorney for the Southern District of New York (1906–09) and secretary of war under President William Howard Taft (1911–13). Frankfurter's influence on President Franklin D. Roosevelt was largely responsible for Stimson's return (1940) as head of the War Department during World War II.

Frankfurter was a legal adviser to President Woodrow Wilson at the Paris Peace Conference (1919). During the immediate postwar period he was one of the most active American Zionists, and he helped to found the American Civil Liberties Union (1920). He delivered blistering attacks on the conviction of Nicola Sacco and Bartolomeo Vanzetti—in which he was encouraged by U.S. Supreme Court Justice Louis Brandeis under a secret arrangement that was not revealed until 1982, when their correspondence was published. Brandeis, from his appointment in 1916 until 1939, when Frankfurter himself joined the court, corresponded frequently with Frankfurter, sending him a yearly stipend for legislative research and for such politico-social actions as the defense of Sacco and Vanzetti.

When Franklin D. Roosevelt became president (1933), Frankfurter, who had advised him during his term as governor of New York, advised him on New Deal legislation and other matters. He was appointed by Roosevelt to the Supreme Court on Jan. 5, 1939. Concerned more with the integrity of government than with the victims of legal injustice, Frankfurter evinced toward federal and state legislative action a hands-off attitude similar to that of his friend Justice Oliver Wendell Holmes. His insistence on freedom of expression was partly offset by his disinclination to uphold the civil liberties of political radicals, especially members of the U.S. Communist Party during the "witch hunt" of the 1950s. In *Sweezy v. New Hampshire* (1957), however, he upheld a claim of academic freedom by a socialist college professor subjected to a state investigation.

Frankfurter's belief that decent government depends in part on procedural safeguards for criminal suspects occasionally conflicted with his policy that the Supreme Court should defer to other branches of the federal government and to the states. In the criminal case of *Wolf v. Colorado* (1949), for example, he spoke for the court in condemning illegal seizure of evidence by state officials, but he ruled that the "due process of law" clause of the 14th Amendment (1868) to the U.S. Consti-

Frankfurter

tion did not require a state court to exclude evidence unlawfully obtained. (The Supreme Court repudiated this theory in 1961.) In his last major opinion, a 64-page dissent in *Baker v. Carr* (1962; the first of a series of legislative reapportionment cases in the 1960s), he unsuccessfully asserted that inequitable representation in legislatures is a "political controversy" not subject to the federal judicial power.

Frankfurter retired in 1962. In July 1963 President John F. Kennedy awarded him the Medal of Freedom. Among his books are *The Business of the Supreme Court* (1927; with James Landis); *Mr. Justice Holmes and the Supreme Court* (1938); *The Case of Sacco and Vanzetti* (2nd ed., 1954); and *Felix Frankfurter Reminisces* (1960).

BIBLIOGRAPHY. Liva Baker, *Felix Frankfurter* (1969), is a biography. Michael E. Parrish, *Felix Frankfurter and His Times*, vol. 1, *The Reform Years* (1982), surveys his career before his appointment to the Supreme Court. Helen Shirley Thomas, *Felix Frankfurter: Scholar on the Bench* (1960), analyzes his legal thinking. H.N. Hirsch, *The Enigma of Felix Frankfurter* (1981), is a psychobiographical reappraisal.

Frankfurter Allgemeine Zeitung (German: "Frankfurt General Newspaper"), abbreviation FAZ, daily newspaper published in Frankfurt am Main, one of the most prestigious and influential in Germany.

FAZ was created after World War II by a group of journalists who had worked on the highly respected *Frankfurter Zeitung* before the war. The earlier paper was suppressed by Adolf Hitler in 1943, and under the Allied occupation forces another paper, the *Allgemeine Zeitung*, was started. When control of the press was turned over to the new West German government in 1949, *Frankfurter Allgemeine Zeitung* began publication, pledging truth, objectivity, and fair treatment of opposing viewpoints.

FAZ was the first West German daily of truly national scope, and it quickly won a reputation for responsible reporting. Its sober makeup and sparing use of illustrations give it a serious appearance consonant with its approach to world and national news.

The staff considers the paper's editorial policy to be centrist, but it is widely accounted conservative because of its championship of private enterprise. More than 10 percent of its readers are in other countries of Europe and abroad.

frankincense, also called **OLIBANUM**, aromatic gum resin containing a volatile oil that was valued in ancient times in worship and as a medicine and is still an important incense resin. Frankincense is obtained from trees of the genus *Boswellia* (family Burseraceae), and particularly from the varieties *B. frereana*, *B. bhaw-dajiana*, and *B. carteri*, which are found in Somalia, the Hadhramaut region of Yemen, and Oman. Incisions are made in the trunks of the trees, and the frankincense exudes as a milky juice that hardens on exposure to air.

Frankincense was used by the ancient Egyptians in their religious rites. It constituted part of the Jewish incense of the sanctuary and is frequently mentioned in the Pentateuch. Pliny the Elder described the characteristics of good-quality frankincense and mentioned it as an antidote to hemlock poisoning. The Iranian physician Avicenna recommended it for a wide range of bodily ailments. In China and elsewhere in the East, it was used as both an internal and an external remedy, but, according to modern Western medical theory, it has no special value. Frankincense is used in incense and fumigants and as a fixative in perfumes.

The hardened gum resin, gum thus, from

which spirits of turpentine is produced, is sometimes called common, or American, frankincense.

Frankland, Sir Edward (b. Jan. 18, 1825, Churchtown, Lancashire, Eng.—d. Aug. 9, 1899, Golaa, Nor.), English chemist who was one of the first investigators in the field of structural chemistry.

Frankland
BBC Hulton Picture Library

While apprenticed to a druggist, Frankland learned to perform chemical experiments. Subsequent studies took him to laboratories at the University of Marburg, where he took his Ph.D. (1849). He became the first professor of chemistry at Owens College, Manchester (1851), and succeeded Michael Faraday as professor of chemistry at the Royal Institution of Great Britain, London (1863). In 1865 he began 20 years of service at the Royal School of Mines.

Research beginning about 1850 led him to the idea that an atom of an element can combine only with a certain limited number of atoms of other elements. He thus established a theory of valency (1852), which became the basis of modern structural chemistry.

Appointed a member of the second royal commission on the pollution of rivers (1868), he brought to light an enormous amount of information on the contamination of rivers and on water purification. In 1868 he cooperated with Joseph Norman Lockyer in the studies that led Lockyer to recognize the existence of helium in the Sun's atmosphere. Frankland was knighted in 1897.

Franklin, unofficial state (1785–90) of the United States of America, comprising the eastern portion of what is now Tennessee and extending to "unclaimed" lands to the west.

The short-lived state was established mainly as a result of North Carolina's cession of its western lands to the United States. Settlers in the isolated mountain wilderness, deserted and largely ignored, formed an association that would make and administer laws. They also required an active militia because they were open to Indian attack. When North Carolina acted to rid itself of the unwanted burden of protecting these remote settlements, the settlers elected delegates who met to discuss the establishment of a new state. Patterning their state constitution on that of North Carolina, the Franklanders (as they called themselves) elected officers who would act under the leadership of John Sevier. Personal rivalries and other factors led to the dissolution of the Franklin union, and, when the federal government in 1790 brought into being the Southwest Territory, it effectively reorganized the area, and the Franklin administration ended.

Franklin, city, seat of Venango county, northwest Pennsylvania, U.S., at the junction of French Creek and the Allegheny River, 70 miles (113 km) north of Pittsburgh. The site was early occupied by the Indian village of Venango and after 1750 by forts of the French (Fort-Machault), the British (Fort Venango), and the Americans (Fort Franklin). The U.S. fort, erected in 1787, was named for Benjamin Franklin; a town, laid out in 1795, developed around it. Franklin was the site of Pennsyl-

vania's third oil gusher when in 1860 James Evans, a blacksmith, dug a well for water and found oil instead. Within two years Franklin, with nearby Oil City, emerged as the hub of an oil region producing more than 2,000,000 barrels annually. The boom lasted until about 1900, when the oil-production centre shifted to the American Southwest. Among those attracted by the boom was the magnate John D. Rockefeller; John Wilkes Booth, the assassin of Abraham Lincoln, was the owner of one of the early Franklin wells, and his memorabilia is displayed in the Venango County Museum.

The petroleum industry continues to dominate the city's economy. Manufactures include metals and metal products, oil-well and railroad equipment, and pumps. Inc. borough, 1823; city, 1868. Pop. (1990) 7,329.

Franklin, city, seat of Williamson county, central Tennessee, U.S., on the Harpeth River, 20 miles (32 km) south-southwest of Nashville. Settled in 1799 and named for Benjamin Franklin, it is known for the bloody American Civil War battle fought there on Nov. 30, 1864. Confederate forces under General John B. Hood made a frontal attack on a Union army entrenched by the river under General John Schofield. The Union troops sustained 2,500 casualties and retreated across the river to Nashville, but not before inflicting heavy losses on the Confederates—more than 6,000 dead, including six generals (Adams, Carter, Cleburne, Gist, Granbury, and Strahl). The battle marked the failure of Hood's Tennessee campaign and the disintegration of his army a few weeks later at Nashville. Carter House (1830), which served as the Union command post, commemorates the battle and displays Civil War relics. The Confederate Cemetery remains a grim reminder of the carnage.

The town has survived as a centre for diversified farming (corn [maize], tobacco, wheat, and cheese) with hardwood-timber and phosphate-mining interests. Pop. (1990) 20,098.

Franklin, Aretha, byname **QUEEN OF SOUL** (b. March 25, 1942, Memphis, Tenn., U.S.), American gospel and blues singer-composer who was one of the first performers in "soul music" to achieve widespread popularity with white audiences.

Franklin's family moved to Detroit when she was two years old. Her father was a well-known revivalist preacher, and his church attracted many famous black singers. The Franklin home was host to such luminaries as Mahalia Jackson, James Cleveland, B.B. King, and Dinah Washington.

At the age of 12 she made her first recording, and, after graduating from high school, she decided to become a professional singer. At first she performed only on the gospel and "chitlin" circuits, as the type of music she sang, a combination of gospel, jazz, and blues, had usually been presented to white audiences only in a more diluted form by white singers. In 1967 Franklin became a major singer in the popular-music field with the release of several songs that became hits—"I Never Loved a Man," "Baby, I Love You," and "Respect," the last of which became something of an anthem for the civil-rights movement. For a number of years she was a major force in popular music, winning several Grammy awards and appearing frequently on television.

Franklin, Benjamin, pseudonym **RICHARD SAUNDERS** (b. Jan. 17 [Jan. 6, Old Style], 1706, Boston—d. April 17, 1790, Philadelphia), American printer and publisher, author, inventor and scientist, and diplomat, who is probably best remembered for his role in separating the American colonies from Great Britain and in helping to frame both the Declaration of Independence and the U.S. Constitution. By the time he began his diplomatic career, Franklin had invented the Franklin stove, bifocal spectacles, and the lightning rod.

He had made a small fortune from his various business ventures and contributed to science with his experiments in electricity.

A brief account of the life and works of Benjamin Franklin follows. For a full biography, see **MACROPAEDIA: Franklin**.

The 10th son of 17 children of a soap and candlemaker, Franklin ended his formal education at the age of 10. At 12 he was apprenticed to his brother, a printer, and he worked at that trade first in Philadelphia and later in London. In about 1729 he became the printer of paper currency for the colony of Pennsylvania and some of the other colonies. At that time he began publication of the *Pennsylvania Gazette*, a colonial newspaper, and *Poor Richard's*, a series of almanacs in which he printed numerous proverbs praising prudence, industry, and honesty. Franklin promoted the establishment of such public services as a fire department, a lending library, and an academy that grew to be the University of Pennsylvania. In 1748 he gave up the management of his publications to devote himself to science, but in 1753 he served as deputy postmaster general in charge of the mails in all the northern colonies.

Franklin spent the years from 1757 to 1762 in London representing the colony of Pennsylvania in a dispute over the lands held by the Penn family. In 1764 he was sent back to London, and in March 1775, aware that there might be war between the colonies and Great Britain, he left England. Back in Philadelphia he served as a delegate to the Second Continental Congress, in which he helped draft the Declaration of Independence. In 1776 Franklin went to France to seek military and financial aid for the colonies. There he became a hero to the French people, the personification of the unsophisticated nobility of the New World. At the close of the Revolutionary War, Franklin was one of the diplomats chosen to negotiate peace with Great Britain, and, although his proposal for a one-chamber national legislature was rejected, he was instrumental in achieving the adoption of the U.S. Constitution.

Franklin, Sir John (b. April 16, 1786, Spilsby, Lincolnshire, Eng.—d. June 11, 1847, near King William Island, British Arctic Islands [now Northwest Territories, Can.]), English rear admiral and explorer whose ill-fated expedition (1845) is credited with having proved the existence of the Northwest Passage, a Canadian Arctic waterway connecting the Atlantic and Pacific oceans.

Franklin entered the Royal Navy at the age of 14, accompanied Matthew Flinders on his exploratory voyage to Australia (1801–03), and served in the battles of Trafalgar (1805) and New Orleans (1814). He commanded the *Trent* on Captain David Buchan's Arctic expedition of 1818, which sought to reach the North Pole.

From 1819 to 1822 Franklin conducted an overland expedition from the western shore of Hudson Bay to the Arctic Ocean, and he surveyed part of the coast to the east of the Coppermine River in northwestern Canada. After his return to England he published *Narrative of a Journey to the Shores of the Polar Sea, in the Years 1819, 20, 21 and 22* (1823).

On a second overland expedition to the same region (1825–27), Franklin led a party that explored the North American coast westward from the mouth of the Mackenzie River, in northwestern Canada, to Point Beechey, now in Alaska. A second party followed the coast eastward from the Mackenzie to the Coppermine. These efforts, which added new knowledge of about 1,200 miles (1,932 km) of the northwest rim of the North American coast-

line, were described in *Narrative of a Second Expedition to the Shores of the Polar Sea, in the Years 1825, 1826, and 1827* (1828).

Sir John Franklin, engraving by G.R. Lewis, 1824

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

Knighted in 1829, Franklin served as governor of Van Diemen's Land, now Tasmania, from 1836 to 1843.

Franklin's search for the Northwest Passage began on May 19, 1845, when he sailed from England with two ships, the *Erebus* and the *Terror*, carrying 128 officers and men. The vessels were last sighted by British whalers north of Baffin Island at the entrance to Lancaster Sound in late July. In 1847, when no word had been received, search parties were sent out. For 12 years, various expeditions sought the explorers, but their fate was unknown until 1859. That year, a final search mission, sent in 1857 by Franklin's second wife, Lady Jane Franklin, and headed by Captain Francis Leopold McClintock, reached King William Island, south and west of Lancaster Sound. Found were skeletons of the vessels' crews and a written account of the expedition through April 25, 1848.

Having ascended the Wellington Channel, in the Queen Elizabeth Islands, to 77° N, the *Erebus* and the *Terror* wintered at Beechey Island (1845–46). Returning southward along the western side of Cornwallis Island, they passed through Peel Sound and Franklin Strait. In September 1846 they became trapped in the ice in Victoria Strait, off King William Island (about midway between the Atlantic and Pacific oceans). By April 1848, Franklin and 23 others had perished there. The ships, still gripped by ice, were deserted on April 22, 1848, and the 105 survivors tried to head south across the North American mainland to the Back River, apparently resorting to cannibalism along the way. An old Eskimo woman told McClintock of how the starving men fell down and died as they walked. Franklin himself never proved the existence of the Northwest Passage, but a small party from his expedition may have reached Simpson Strait, which connected with the western coastal waters previously visited by Franklin. Post-mortems conducted on the preserved bodies of several crew members suggest that lead poisoning from eating faultily tinned food may have contributed to the mental and physical decline of the expedition.

BIBLIOGRAPHY. Franklin's life and achievements are portrayed in Richard J. Cyriax, *Sir John Franklin's Last Arctic Expedition* (1939); Paul Nanton, *Arctic Breakthrough: Franklin's Expeditions, 1819–1847* (1970, reissued 1981); Leslie H. Neatby, *The Search for Franklin* (1970); and Roderic Owen, *The Fate of Franklin* (1978). More recent revisionist theories of the expedition's fate are reported in Owen Beattie and John Geiger, *Frozen in Time* (1987), detailing the forensic study of the exhumed bodies of three expedition sailors; and David C. Woodman, *Unravelling the Franklin Mystery: Inuit Testimony* (1991).

Franklin, John Hope (b. Jan. 2, 1915, Rentiesville, Okla., U.S.), American historian and

educator noted for his scholarly reappraisal of the American Civil War era and the importance of the black struggle in shaping modern American identity. He also helped fashion the legal brief that led to the historic Supreme Court decision outlawing public school segregation (1954).

Franklin was the son of a lawyer. After attending Fisk University, Nashville, Tenn. (A.B., 1935) and Harvard University (A.M., 1936; Ph.D., 1941), he continued his career in education at a number of schools, among them Howard University, Washington, D.C. (1947–56), Brooklyn (N.Y.) College (1956–64), the University of Chicago (1964–82), and Duke University, Durham, N.C. (1982–85; emeritus thereafter).

Franklin first gained international attention with the publication of *From Slavery to Freedom* (1947; 6th ed., 1988). His other works

John Hope Franklin, 1990

Amplex Photography

treating aspects of the American Civil War include *The Militant South, 1800–1861* (1956), *Reconstruction: After the Civil War* (1961), and *The Emancipation Proclamation* (1963). *George Washington Williams: A Biography* (1985) and *Race and History: Selected Essays, 1938–1988* (1989) are among his later publications.

Franklin, Rosalind, in full ROSALIND ELSIE FRANKLIN (b. July 25, 1920, London, Eng.—d. April 16, 1958, London), British scientist who contributed to the discovery of the molecular structure of deoxyribonucleic acid (DNA), a constituent of chromosomes that serves to encode genetic information.

Franklin studied physical chemistry at Newnham College, Cambridge, graduating in 1941. She then joined the British Coal Utilisation Research Association, where she contributed to studies that explained the absorption properties of coals. From 1947 to 1950 she worked with Jacques Mering at the State Chemical Laboratory in Paris, studying X-ray diffraction technology. That work led to her research on the structural changes caused by the formation of graphite in heated carbons—work that proved valuable for the coking industry.

In 1951 Franklin joined the Biophysical Laboratory at King's College, London. There she applied X-ray diffraction methods to the study of DNA. She is credited with discoveries that established the density of DNA, its helical conformation, and other significant aspects.

From 1953 to 1958 Franklin worked in the Crystallography Laboratory at Birkbeck College, London. While there she completed her work on coals and on DNA and began a project on the molecular structure of the tobacco mosaic virus. She collaborated on studies showing that the ribonucleic acid (RNA) in that virus was embedded in its protein rather than in its central cavity and that this RNA was a single-strand helix, rather than the double helix found in the DNA of bacterial viruses and higher organisms.

BIBLIOGRAPHY. Anne Sayre, *Rosalind Franklin and DNA* (1975), is a biography.

Franklin-Bouillon Agreement: see Ankara, Treaty of.

Franklin Institute, in Philadelphia, Pa., one of the foremost American science and technology centres. Founded in 1824, the institute embraces the Bartol Research Foundation, the Franklin Research Center, the Franklin Institute Research Laboratory, Inc., the Franklin Institute Science Museum and Planetarium, and the Benjamin Franklin National Memorial.

The institute hosted the first International Electrical Exhibition in the United States (1884). It also offered the first public demonstration of transcontinental telephony (1916). Named after Benjamin Franklin, the institute moved into its present building in the early 1930s. The institute has a vast technical library on science and technology.

Franklin stove, type of wood-burning stove, invented by Benjamin Franklin (c. 1740), that was used to warm frontier dwellings, farmhouses, and urban homes for more than 200 years. See stove.

franklinia, also called FRANKLIN TREE (*Franklinia*, or *Gordonia alatumaha*), small tree of the tea family (Theaceae), native to the southeastern United States. It was first identified in 1765 by the botanist John Bartram along the Altamaha River near Fort Barrington, Georgia, and named in honour of Benjamin Franklin. The tree or small shrub is now known only in cultivation, no longer being found in the wild. It grows up to 9 m (30 feet) in height, has large leaves, and produces large, nearly stalkless, cupped white flowers from midsummer to frost. All the franklinias now in existence were propagated from the seeds and plants collected by Bartram.

The franklinia is sometimes known as mountainbay (*Gordonia alatumaha*) because of its similarities to loblolly-bay (*G. lasianthus*).

frankpledge, system in medieval England under which all but the greatest men and their households were bound together by mutual responsibility to keep the peace. Frankpledge can be traced back to the laws of King Canute II the Great of Denmark and England (d. 1035), who declared that every man, serf or free, must be part of a hundred, a local unit of government, that could put up a surety in money for his good behaviour. By the 13th century, however, it was the unfree and landless men who were so bound. While a freeholder's land was sufficient pledge, the unfree had to be in frankpledge, generally an association of 12, or in tithing, an association of 10 householders. Frankpledge existed more commonly in the area under the Danelaw, from Essex to Yorkshire, whereas tithing was found in the south and southwest of England. In the area north of Yorkshire, the system does not appear to have been imposed.

Franks, Sir Augustus Wollaston (b. March 20, 1826, Geneva, Switz.—d. May 21, 1897, London, Eng.), the first keeper (curator) of British and medieval antiquities and ethnography at the British Museum (1866–96), who greatly enriched its holdings through careful acquisition and the donation of his own vast and valuable collections.

Franks's early life was spent on the European continent, mainly in Rome and Geneva. Educated at the University of Cambridge (B.A., 1849; M.A., 1852), he worked first for the Royal Archaeological Institute. Assistant in the antiquities department of the British Museum (1851–66), he became the foremost authority on British medieval antiquities and an expert on post-Roman art, pottery, glass, and the material culture of early humans. He also sought to make the collection of Japanese and Chinese porcelain as comprehensive as possible. His friendliness won the good will and benefactions of many collectors, includ-

ing banker-ethnologist Henry Christy, whose large collection entered the museum in 1883. Franks did much to classify and arrange the museum collections and published many catalogs, guides, and papers. He was knighted in 1894.

Franschetti-Klein syndrome (congenital disorder): *see* mandibulofacial dysostosis.

Františkovy Lázně, German FRANZENBAD, spa town, *Západočeský kraj* (region), Czech Republic. It lies on a flat plateau near the German border. Since medieval times, it has been known for its springs, which are rich in carbon dioxide and Glauber's salt (a sulfate of sodium) and some of which are radioactive. In the 16th century, the alchemist Paracelsus attempted to analyze the waters, and barrels of water from the best-known spring, Frantisek Spring, were sold in nearby Cheb; but not until the end of the 18th century did Františkovy Lázně become established as a spa. Named in 1793 for Francis II, the last Holy Roman emperor, it became a town in 1865. It owes much of its reputation to a rich sulfurous-ferrous mud (cut from the moor at nearby Soos) that is used for mud baths and packs in the treatment of gynecological disorders. Prior to 1939, its inhabitants were almost entirely German, but the resettled population is mainly Czech. Pop. (latest est.) 5,932.

Franz (German personal name): *see under* Francis, except as below.

Franz, Robert (b. June 28, 1815, Halle, Saxony [Germany]—d. Oct 24, 1892, Halle, Ger.), German musician who is considered to have been one of the foremost composers of songs in the tradition of Franz Schubert and Robert Schumann.

Franz studied organ at Dessau from 1835 to 1837. Later he returned to Halle, where he became a friend of Wilhelm Osterwald, many of whose poems he set to music. About the time he published his first songs (1843) he began to become deaf; nonetheless, he became organist at the Ulrichs Church, then conductor of the city's Singakademie, and, finally, musical director at Halle University, where he was made a doctor of music in 1861. Increasing deafness and nervous disorders caused him to retire in 1868, and he was supported for the rest of his life by a singer, Arnold von Pilsach. Franz Liszt, Joseph Joachim, and other prominent musicians arranged concerts for his benefit in 1872. In his later years Franz arranged works by Johann Sebastian Bach, George Frideric Handel, Wolfgang Amadeus Mozart, and Schubert.

His songs, of which there are about 350, are remarkable for their sensitive musical prosody. About a quarter are to texts by Heinrich

Robert Franz
By courtesy of the Royal College of Music, London

Heine. Most of his songs are strophic, with the music repeated after each verse, and were written for a mezzo-soprano of limited range. Among them are "Lullaby," "Stormy Night,"

and "Dedication." He also wrote a few choral and religious works.

Franz Ferdinand: *see* Francis Ferdinand, archduke of Austria-Este.

Franz Josef Land, Russian ZEMLYA FRANTSJA-IOSEFA, archipelago of 191 islands in the northeastern Barents Sea, the northernmost territory of Russia. It falls administratively into Arkhangelsk *oblast* (province). The islands, with a land area of 6,229 square miles (16,134 square km), consist of three groups. The easternmost includes Rudolf Island, whose Fligeli Cape is the northernmost point in Russia, and the large islands of Zemlya Vilcheka and Greem-Bell (Graham Bell). This group is separated from the central group, which contains most of the islands, by the Avstriysky (Austrian) Strait. The western group, divided from the rest of the archipelago by the Britansky Channel (British Channel), contains two large islands, Zemlya Georga (the largest, with an area of about 1,120 square miles [2,900 square km]) and Zemlya Aleksandry.

Franz Josef Land is mainly low-lying; the highest point, on Viner-Nyoyshtadt Island, reaches 2,034 feet (620 m). It comprises a series of lowland plateaus, 85 percent of whose surface is covered by ice. The islands are formed from marine deposits of Early and Middle Jurassic age (208 to 163 million years old) and are covered by thick basaltic crusts. Elsewhere are Late Cretaceous deposits (97.5 to 66.4 million years ago) with occasional lignite also overlain by basalt. During the Early Jurassic, Franz Josef Land was a single landmass; it was dislocated during the Quaternary Period (1.6 million years ago to the present) by severe faulting. As a result, the straits between the islands are often very deep, up to 1,650 feet (500 m) deeper than the surrounding Barents Sea.

The climate is severe, the average winter temperature being -8°F (-22°C), the av-

Franz Josef Land

erage summer temperature 35°F (2°C), though summer temperatures of up to 54°F (12°C) have been recorded. Vegetation consists primarily of lichens, mosses, and about three dozen species of Arctic flowering plants. Fauna include polar bears and the Arctic fox, with numerous bird species, of which perhaps 15 nest in the islands. Marine fauna include the walrus, seal, and bearded seal.

Franz Josef Land was discovered by an Austro-Hungarian expedition under Julius von Payer and Karl Weyprecht in 1873; it was named after the Austrian emperor. The Soviet Union annexed the islands in 1926 and maintained permanent weather stations there.

Franz Joseph (Austrian emperor): *see* Francis Joseph.

Franzén, Frans Mikael (b. Feb. 9, 1772, Uleåborg, Swedish Finland [now Oulu, Fin.]—d. Aug. 14, 1847, Härnösand, Sweden), Finnish-Swedish poet, educator, and cleric who was a forerunner of the Romantic movement in Sweden.

Franzén, oil painting by J.G. Sandberg, 1828; in Gripsholm Castle, Sweden
By courtesy of the Svenska Portrattarkivet, Stockholm

Franzén studied at Åbo, Fin., where in 1798 he became professor of philosophy. After the annexation of Finland by Russia, Franzén went to Sweden (1811). In 1831 he was appointed bishop of Härnösand, where he lived until his death.

Franzén was a master of a new poetic style in Swedish literature. William Shakespeare, John Milton, and Thomas Gray made a deep impression on him. His work consists chiefly of simple, idyllic lyrics, and his best poems embody the imaginative spirit of the Romantic era.

Frascati, town and episcopal see, Roma *provincia*, Lazio (Latium) *regione*, central Italy. It lies on the northern slopes of the

Alban Hills, 16 miles (21 km) southeast of Rome.

The town of Frascati seems to have arisen on the site of a large villa in the 9th century and expanded after the destruction in 1191 of the ancient city of Tusculum (*q.v.*), 1.5 miles (2.4 km) northeast, whose inhabitants sought refuge there. A medieval papal possession, it was a favourite summer residence of the Roman nobility from the time of the Renaissance; notable villas include the Falconieri, Torlonia, Lancellotti, Aldobrandini, and Mondragone. The town's cathedral contains a memorial to Charles Edward the Young Pretender (the last serious Stuart claimant to the British throne), whose body rested there for a time; his brother Henry Stuart, cardinal duke of York, was bishop

of Frascati and left a library, the Biblioteca Eboracense. During World War II the town was the German army headquarters of Field Marshal Albert Kesselring and suffered severe damage from Allied bombings. Restorations of the churches and villas have been carried out wherever possible. Linked with Rome by railway and bus service, Frascati is residential in character and is mainly concerned with tourism and wine production. Pop. (2000 est.) mun., 20,674.

Frasch, Herman (b. Dec. 25, 1851, Gaildorf, Württemberg [now in Germany]—d. May 1, 1914, Paris, France), American chemist who devised the sulfur-mining process named in his honour. The Frasch process, patented in 1891, was first used successfully in Louisiana and in East Texas. It made possible the exploitation of extensive sulfur deposits otherwise obtainable only at prohibitive expense.

Emigrating to the United States in 1868, Frasch worked as a chemist in Philadelphia and in Cleveland, Ohio, and in 1885 he organized the Empire Oil Company, Petrolia, Ont. For this firm he devised a method (also called the Frasch process) of removing sulfur from crude oil. He also patented processes for manufacturing white lead, sodium carbonate, and carbon for the filaments in electric light bulbs. The Union Sulphur Company, of which he was president, became the world's leading sulfur-mining firm.

Frasch process, method of mining deeplying sulfur invented by the German-born U.S. chemist Herman Frasch; it consists of forcing superheated water, above the temperature at which sulfur melts (about 116° C, or 241° F) into the deposit. The liquid sulfur, which is more than 99 percent pure, is pumped to the surface. The liquid mixture of sulfur and water brought up is discharged into bins, where the sulfur is allowed to solidify.

Frasch first successfully mined sulfur by this process at Sulfur Mine, Louisiana, in 1894. In 1895 the Union Sulphur Company was organized with his help to produce Frasch-process sulfur. Other companies soon began production from deposits located near the Gulf of Mexico in Texas and Louisiana.

Fraser (of North Cape), Bruce Austin Fraser, 1st Baron (b. Feb. 5, 1888, Acton, near London, Eng.—d. Feb. 12, 1981, London), British admiral in World War II and chief of the naval staff (1948–51).

Fraser entered the Royal Navy in 1902 and served as a gunnery officer in World War I. He continued his interest in gunnery after the war and in 1933 became director of naval ordnance. At the start of World War II he was controller of the navy and was in large part responsible for directing its expansion during the 1939–41 period. Fraser then became commander in chief of the Home Fleet and was chiefly concerned with the protection of convoys to the U.S.S.R. On Dec. 26, 1943, aboard his flagship "Duke of York," he fought and sank the German battleship "Scharnhorst" off Norway's North Cape in an engagement conducted largely at night with the aid of radar. As admiral in 1944 he was appointed commander in chief of the British Pacific fleet and on Sept. 2, 1945, signed the Japanese surrender papers for Great Britain in Tokyo Bay.

Fraser was made a peer in 1946 and admiral of the fleet in 1948, and from 1948 to 1951 he was first sea lord of the Admiralty.

Fraser, Dawn (b. Sept. 4, 1937, Balmain, near Sydney, Austl.), Australian swimmer, the first woman swimmer to win gold medals in three consecutive Olympics Games (1956, 1960, 1964). From 1956 to 1964 she broke the women's world record for the 100-metre freestyle race nine successive times. Her mark

of 58.9 seconds, established on Feb. 29, 1964, at North Sydney, was unbroken until Jan. 8, 1972, when Shane Gould, a fellow Australian, achieved 58.5 at Sydney.

In the 1956 Olympic Games in Melbourne, Fraser captured gold medals in the 100-metre freestyle event and in the 400-metre freestyle relay race. She repeated her triumph in the 100-metre freestyle in the 1960 and 1964 Games, in Rome and Tokyo respectively, and added silver medals in the 400-metre freestyle (1956), the 400-metre freestyle relay (1960, 1964), and the 400-metre medley relay (1960). Her performances in the 1964 Olympics were especially noteworthy because she had been injured seriously in an automobile accident in March of that year.

In 1957 Fraser won the United States women's freestyle championship at 110 yards (nearly equivalent to 100 metres). In addition to her unusually long-lived world record for 100 metres, she set world standards (all broken by the early 1970s) in freestyle swimming at five other distances up to 220 yards. Fraser later represented her native Balmain in the parliament of New South Wales, in 1988–91. Her autobiographies were *Below the Surface* (1965; also published as *Gold Medal Girl*) and *Dawn: One Hell of a Life* (2001).

Fraser, (John) Malcolm (b. May 21, 1930, Nareen, Vic., Austl.), Australian politician and leader of the Liberal Party, who served as prime minister of Australia from 1975 to 1983.

Fraser attended Magdalen College, Oxford, and was elected a Liberal member of Parliament in 1955. He held cabinet posts in the coalition government of the Liberal and National Country (since 1982 National) parties as minister for the army (1966–68), as minister for education and science (1968–69, 1971–72), and as minister for defense (1969–71).

In March 1975 Fraser won the leadership of the Liberal Party, and in November he was named prime minister after the Labor government—which had been in power since 1972—had been dismissed; his appointment received electoral approval in December, when the Liberal and National Country parties won by large majorities, and he set up another coalition government. As prime minister Fraser attempted to curb inflation by such orthodox measures as trimming government spending and discouraging union demands for large wage increases. He was also a firm supporter of Australia's defense commitments within the ANZUS Pact alliance. Fraser's government was again successful in elections held in 1977 and 1980, but it was defeated by the Labor Party in an election held in March 1983. Fraser immediately resigned as party leader and shortly thereafter resigned his seat in Parliament.

Fraser, Peter (b. Aug. 28, 1884, Fearn, Ross, Scot.—d. Dec. 12, 1950, Wellington, N.Z.), statesman, labour leader, and prime minister (1940–49) whose leadership during World War II increased New Zealand's international stature.

Peter Fraser

By courtesy of the High Commissioner for New Zealand

While working in London in 1908, Fraser joined the Independent Labour Party, but unemployment led him to emigrate to New Zealand in 1910, where he worked on the wharves in several ports and was active in union organizing in Auckland and in the harshly repressed Waihi and Wellington strikes of 1912–13. He helped organize the Social Democratic Party in 1913 and its successor, the Labour Party, in 1916. He was imprisoned for sedition (1916–17) when he opposed conscription for World War I.

In 1918 he entered Parliament, and soon became secretary of the Labour Party. When Labour came into power in 1935, he became minister of education, health, marine, and police. He was responsible for legislation that revised the educational system, especially at the secondary level, and for the Social Security Act (1938), which created a national health service and improved pensions.

Fraser succeeded Michael Joseph Savage as prime minister in 1940 and led the country's mobilization for war. He won a voice for New Zealand in Allied military strategy in the Pacific and presided over a successful wartime price stabilization program organized by his minister of finance, Walter Nash. As one of the architects of the United Nations (1945) and a contributor to the UN Charter, Fraser was a spokesman for the rights of small nations, arguing unsuccessfully both against veto power for the great powers and for guaranteed aid to nations facing aggression.

Union unrest and discontent with economic controls and with Fraser's legislation for peacetime conscription led to Labour's defeat in 1949 after 15 years in office. Fraser then led the opposition in Parliament until his death the following year.

Fraser, Simon: see Lovat, Simon Fraser, 11th Lord.

Fraser, Simon (b. 1776, Bennington, N.Y.—d. April 19, 1862, St. Andrews, Canada West), Canadian fur trader and explorer who discovered the Fraser River in British Columbia.

Fraser, whose loyalist father had died in a war prison in Albany, N.Y., moved with his family to Canada in 1784. He was apprenticed as a clerk to the North West Company in 1792 and was made a partner of the fur company in 1801. In 1805 he was put in charge of operations of the partnership west of the Rockies and set out to cross them in search of better trading routes, especially an outlet to the Pacific. He built a post at Trout Lake (Fort McLeod) west of the mountains and in 1806 embarked upon a second journey, to explore the Columbia River. After building a post at Fraser Lake, he continued down the Fraser River (mistakenly assuming it to be the Columbia); he reached its mouth in 1808 and found the treacherous, turbulent river entirely unsuitable for trade. He also realized that its latitude was far north of the Columbia.

In 1810 Fraser assumed charge of the Athabasca department. At this time, the North West Company was meeting competition from the Hudson's Bay Company, whose new head, Lord Selkirk, was introducing settlers into the Red River Valley in the North West Company's trading territory. Fraser, who took charge of the Red River department in 1811, was arrested by Selkirk in 1817 for alleged participation in a June 1816 attack against settlers, known as the Seven Oaks massacre. He and four others were sent to Montreal for trial, but all were acquitted.

Fraser Canyon, deep chasm cut by the Fraser River in British Columbia, Canada, between Lytton and Yale. The river there flows through wild, rugged, spectacular scenery, including mountains rising more than 3,000 feet (914 m). Hell's Gate is in this section of the river. As part of a transportation improvement program since 1955, the Alexandra North Arch

was constructed in Fraser Canyon. North of Hope, the canyon has seven highway tunnels, up to 2,000 feet (610 m) long, cut through solid rock.

Fraser Island, also called GREAT SANDY ISLAND, island off the southeastern coast of Queensland, Australia, separated from the mainland and the port of Maryborough by Hervey Bay and Great Sandy Strait. About 75 miles (120 km) long, it has an area of 625 square miles (1,620 square km). Sand hills rise to nearly 800 feet (250 m), and there are many freshwater lakes stocked with fish. The southwestern part of the island is a tourist resort. Part of Fraser Island has been a forest reserve since 1908, about one-fourth of the island was declared a national park in 1971, and in 1976 Great Sandy National Park was named and extended to occupy one-third of the island. It yields kauri and hoop pine, blackbutt, and satinay timber. Sand mining was carried out on the island until 1977, when the Commonwealth government banned exports of the mineral sands. The island was sighted in 1770 by British explorer Captain James Cook, who believed it to be a promontory; the first landing was made by navigator Matthew Flinders in 1802. It was named for Captain James Fraser, who, with several of his party, was killed there by Aborigines in 1836.

Fraser River, major river of western North America, draining a huge, scenic region of some 92,000 square miles (238,000 square km) in central British Columbia. About 70 percent of the region drained is over 3,000 feet (900 m) high, and human exploitation of this rather isolated area has been relatively recent. The natural beauties of the river course (particularly its spectacular canyon section) and the surrounding countryside have nevertheless remained relatively unspoiled. The river was named for Simon Fraser, who first descended it to the Pacific Ocean in 1808. The Cariboo gold rush, which began in 1858, took place in the Fraser River basin.

From its source in Yellowhead Lake on the British Columbia-Alberta border, the Fraser flows 851 miles (1,370 km) to its mouth on the Strait of Georgia. From its mountain source, the river's course is initially northward, descending by gentle gradients along the Rocky Mountain trench. Near latitude 54° N the river makes a great bend southward to traverse the Interior Plateau and then the Coast Mountains. Entrenchment and gradients increase progressively downstream, and through the Coast Mountains the raging waters traverse a canyon about 5,000 feet (1,500 m) deep. Below this canyon the Fraser turns westward to flow placidly across an alluvial plain to its debouchment near Vancouver, B.C. The Thompson River, which enters the Fraser about 145 miles (235 km) from its mouth, is the most important of numerous tributaries, many of which rise in extensive mountain lakes. Navigation is important only in the tidal estuary where New Westminster serves deep-sea ships.

The economy of the Fraser River basin is based mainly on forestry. Coniferous forests cover most of the Interior Plateau, except in the dry, southern valleys, which are covered with narrow strips of grassland on the lower slopes. Prior to 1940 small sawmills cut a little lumber along the three railway lines that crossed the basin. After 1950, however, the northward extension of the Pacific Great Eastern Railway (subsequently called the British Columbia Railway) and the improvement of highway facilities increased the accessibility of the forests. Forest products are either transported to Vancouver for overseas markets or are taken eastward by rail to central Canada and the midwestern United States. The turbulent Fraser River itself is not actually used in the forestry industry, even for the transport of logs to the sawmills.

Agriculture has not developed greatly within the river basin, except for cattle ranching on the grasslands and upper level parklands in the Chilcotin Plateau, west of the Fraser River, and the Nicola Valley, south of the Thompson River. Ranching was established in the 1860s to supply the gold mining camps and then, after gold mining declined, to supply meat to the growing city of Vancouver.

The Fraser River is the major producer of salmon in British Columbia, and its tributaries and headwater lakes are the spawning grounds of several species of salmon. These salmon ascend the river in late summer to spawn and then go downstream the following year to spend the next two or three years in the ocean. Because of these migratory habits, salmon fishing takes place mainly off the Fraser River mouth, and only Indians have fishing rights in the river basin itself. Hydroelectric exploitation of the river system may eventually threaten salmon migration.

Fraser Hill (West Malaysia): see Bukit Fraser.

Frasnian Stage, all those rocks deposited worldwide during the Frasnian Age (374 to 367 million years ago). The Frasnian Stage and the overlying Famennian Stage together constitute the Upper Devonian Series.

The stage's name is derived from the town of Frasnies in the Ardennes region of southern Belgium, which has served historically as the type district. Under the authority of the International Commission on Stratigraphy, the name has been retained, but the global stratotype section and point (GSSP) defining the base of this unit was reestablished in 1987 on a hillside exposure at Col du Puech de la Suque, 1.1 km (0.7 mile) southeast of Saint-Nazaire-de-Ladarez in the Noires Mountain region of southern France. The boundary point of the Frasnian is defined on the basis of the first occurrence of the conodont *Ancyrodella roundiloba*, which coincided with the base of the conodont *Polygnathus asymmetricus*' biozone. The former species is part of a well-defined lineage, transitional between *A. binodosa* and four successor species of *Ancyrodella*. The goniatite genera *Koenenites*, *Probeloceras*, and *Manticoceras* also have their first occurrences within the lower portion of the *P. asymmetricus* biozone. The top of the Frasnian Stage records the extinction of many marine invertebrates, especially among the colonial rugose corals; stromatoporoids; orthid, pentamerid, and atrypid brachiopods; and trilobites. Also affected were many key conodonts. This major extinction event defines the top of the stage, as well as the base of the overlying Famennian Stage.

Fratellini FAMILY, European circus family best known for the Fratellini Brothers, a clown trio—Paul, François, and Albert (respectively, b. 1877—d. 1940; b. 1879—d. 1951; b. 1886—d. 1961)—whose wit, charm, and superb acting techniques were widely admired and brought about a resurgence of interest in the circus in post-World War I Paris.

Their father, Gustavo Fratellini (1842–1905), a Florentine follower of the Italian patriot Giuseppe Garibaldi, was a circus trapeze artist and acrobat, and their elder brother, Louis (1867–1909), worked as a clown with Paul. François and Albert also began their careers as a pair. When Louis died in 1909, he left a family without support and Paul without a partner. To solve both problems, the remaining brothers formed a unique triple act: François retained his traditional role as the elegant, pompous, white-faced clown; Albert, as the hapless, ragged *Auguste*, designed grotesque new makeup with high black brows, an exaggerated mouth, and a bulbous red nose (a makeup style that influenced countless subsequent clowns); and Paul joined the act in a new role, the *notary*, with little makeup and a

comic style midway between those of his brothers.

The Fratellinis toured Europe and Russia before joining the Cirque Medrano in Paris during World War I. By 1923 they were the toast of Paris, admired by the general public and by such intellectuals as the playwrights Raymond Radiguet and Jean Cocteau, both of whom created characters based on the Fratellinis.

Many of the Fratellini Brothers' children also became circus performers, notably Paul's son Victor (1901–79) and Victor's daughter Annie (1932–97), who continued the family tradition as successful clowns in France. Albert's memoirs, *Nous, les Fratellini*, appeared in 1955.

fraternity and sorority, in the United States, social, professional, or honorary societies, for males and females, respectively. Most such organizations draw their membership primarily from college or university students. With few exceptions, fraternities and sororities use combinations of letters of the Greek alphabet as names.

The basic function of the social fraternity is to serve as a collegiate "home" and dormitory for its members, but the emphasis varies from school to school. At some universities Greek-letter societies are the nucleus of campus political and social life, while at others fraternities and sororities are barely tolerated or barred altogether.

The membership of professional fraternities is limited to students and faculty members engaged in a particular field of specialization. Membership qualifications are broader than for the social groups and emphasize activities designed to develop professional competency rather than social life. The first professional fraternity, Kappa Lambda, was founded in 1819 for medical students.

Perhaps the leading honorary society today is Phi Beta Kappa, which began as a social fraternity at the College of William and Mary, Williamsburg, Va., in 1776. Membership is now based on general scholarship and is open to both men and women. The oldest social fraternity still in existence as such is Kappa Alpha, begun in 1825 at Union College, Schenectady, N.Y.

Fratres Arvales (Roman brotherhood): see Arval Brothers.

Fratres Militiae Christi: see Brothers of the Sword, Order of the.

fraud, in law, the deliberate misrepresentation of fact for the purpose of depriving someone of a valuable possession. Although fraud is sometimes a crime in itself, more often it is an element of crimes such as obtaining money by false pretense or by impersonation.

European legal codes and their derivatives often broadly define fraud to include not only intentional misrepresentations of fact, clearly designed to trick another into parting with valuable property, but also misunderstandings arising out of normal business transactions. Thus, any omission or concealment that is injurious to another or that allows a person to take unconscionable advantage of another may constitute criminal fraud. In Anglo-American legal systems, this latter type of fraud may be treated as deceit, subject to action in civil rather than criminal law.

A common type of criminal fraud is the obtaining of property by giving a check for which there are insufficient funds in the signer's account. Another is the so-called confidence game (*q.v.*), which involves not only a misrepresentation of fact but also the betrayal of confidence induced by the offender in the victim. The fraud of impersonation is the false representation by one person that he is another or that he occupies the position of another. See also embezzlement; theft.

Frauenfeld, capital (since 1803) of Thurgau *kanton* ("canton"), northern Switzerland, on the Murg River, close to its junction with the Thur River, northeast of Zürich. First mentioned in 1246, it was founded by the count of Kyburg and the abbot of Reichenau on land belonging to the abbot. Frauenfeld ("Field of Our Lady") passed to the Habsburgs in 1264 and was seized by the Swiss Confederates (Eidgenossen) in 1460, later becoming the seat of the federal Diet from 1712 to 1798. Two great fires (1771 and 1788) destroyed the whole town except the 13th-century castle (now housing the cantonal museum), one house, and the Evangelical church, with 14th-century stained-glass windows. A road and rail junction, Frauenfeld produces textiles, metal products, and food preserves. The population is German speaking and about three-quarters Protestant. Pop. (1986 est.) 18,944.

Frauenlob, byname of HEINRICH VON MEISSEN (b. c. 1260, Meissen, Thuringia [Germany]—d. Nov. 29, 1318, Mainz, Franconia [Germany]), late Middle High German poet. He was the original representative of the school of middle-class poets who succeeded the knightly minnesingers, or love poets, adapting the minnesinger traditions to poems dealing with theological mysteries, scientific lore, and philosophy. His nickname, meaning "extoller of ladies," supposedly derives from his championship of the title *Vrowe* (lady) over *Wip* (woman) in a contest with a rival poet.

Well-educated and precocious—a record exists of his participation in a poetic debate at 13—he became a wandering court minstrel, dwelt for some time in Prague, and settled in Mainz (c. 1312), where he founded the first meistersinger school. Though it is unlikely that this school had the rigid structure of the meistersinger *Singschulen* of the 15th century, the strained ingenuity and mannered conceits that characterize Frauenlob's verses make him the true model of the meistersingers. His best-known poem, *Marienleich* ("Mary's Song"), is an impressive display of virtuosity in which the Virgin is praised in complex language that combines traditional religious imagery, double meanings, and esoteric philosophical allusions.

Fraunhofer, Joseph von (b. March 6, 1787, Straubing, Bavaria [Germany]—d. June 7, 1826, Munich), German physicist who first studied the dark lines of the Sun's spectrum, now known as Fraunhofer lines. He also was the first to use extensively the diffraction grating, a device that dispenses light in much the same way a prism does. His work set the stage for the development of spectroscopy.

Fraunhofer, detail of an engraving
Historia-Photo

Fraunhofer worked as an optician at the Untzschneider Optical Institute at Benedictbeuern, near Munich, of which he became manager in 1818. While measuring the light-bending properties of various kinds of glass, he noticed dark lines in the light spec-

trum of a sodium flame, and he continued looking for such lines in the spectra of other elements. Fraunhofer plotted hundreds of spectral lines, and by measuring their wavelengths he found that the relative positions of the lines in the spectra of elements are constant, whether the spectra are produced by the direct rays of the Sun or by the reflected light of the Moon and planets, by a gas, or by a heated metal in the laboratory.

Fraunhofer lines, in astronomical spectroscopy, any of the dark (absorption) lines in the spectrum of the Sun or other star, caused by selective absorption of the Sun's or star's radiation at specific wavelengths by the various elements existing as gases in its atmosphere. The lines were first observed in 1802 by the English physicist William Hyde Wollaston but are named for the German physicist Joseph von Fraunhofer, who from about 1814 plotted more than 500 of them and designated the brightest by the letters A through G, a system of identification still in use. About 25,000 Fraunhofer lines are now known to exist in the solar spectrum, between the wavelengths of 2,950 and 10,000 angstroms. (One angstrom equals 10^{-8} cm.)

fravashi, in Zoroastrianism, the preexisting external higher soul or essence of a person (according to some sources, also of gods and angels). Associated with Ahura Mazda, the supreme divinity, since the first creation, they participate in his nature of pure light and inexhaustible bounty. By free choice they descend into the world to suffer and combat the forces of evil, knowing their inevitable resurrection at the final glory. Each individual's *fravashi*, distinct from his incarnate soul, subtly guides him in life toward the realization of his higher nature. The saved soul is united after death with its *fravashi*. Cosmically, the *fravashis* are divided into three groups—the living, the dead, and the yet unborn. They are the force upon which Ahura Mazda depends to maintain the cosmos against the demon host. Protecting the empyrean (sacred fire), they keep darkness imprisoned in the world.

In the popular religion, the *fravashis* of the righteous dead and of ancestors are invoked for protection. In the Parsi festival Fravartigan, the last 10 days of each year, each family honours the *fravashis* of its dead with prayers, fire, and incense.

fraxinella: see gas plant.

Fray Bentos, city, western Uruguay. Founded in 1859, Fray Bentos became important when the first large-scale meat-packing plant in Uruguay was established there in 1861. The industry grew rapidly and, with the expansion of refrigeration and cold-storage facilities, Fray Bentos developed a significant share of the nation's meat-packing trade, exporting the produce of its stock-raising hinterland. The city has a television station. Its modern port is the deepest on the Uruguayan side of the Uruguay River. The Puerto Unzué bridge, built in 1969 by a United States firm, and an Argentine-Uruguayan company, has facilitated trade between Uruguay and Argentina. Fray Bentos has rail, road, and air connections with Montevideo, the national capital. Pop. (1985) 20,135.

Frazier, Sir James George (b. Jan. 1, 1854, Glasgow, Scot.—d. May 7, 1941, Cambridge, Cambridgeshire, Eng.), British anthropologist, folklorist, and classical scholar, best remembered as the author of *The Golden Bough*.

From an academy in Helensburgh, Dumbar-ton, Frazier went to Glasgow University (1869), entered Trinity College, Cambridge (1874), and became a fellow (1879). In 1907 he was appointed professor of social anthropology at Liverpool, but he returned to Cambridge after one session, remaining there for the rest of his life.

Frazier, 1933

T & R Annan & Sons, Ltd. Glasgow

His outstanding position among anthropologists was established by the publication in 1890 of *The Golden Bough: a Study in Magic and Religion* (reissued in 12 vol., 1907–15; abridged edition in 1 vol., 1922). The underlying theme of the work is Frazier's theory of a general development of modes of thought from the magical to the religious and, finally, to the scientific. His distinction between magic and religion (magic as an attempt to control events by technical acts based upon faulty reasoning, religion as an appeal for help to spiritual beings) has been basically assumed in much anthropological writing since his time. Although the evolutionary sequence of magical, religious, and scientific thought is no longer accepted and Frazier's broad general psychological theory has proved unsatisfactory, his work enabled him to synthesize and compare a wider range of information about religious and magical practices than has been achieved subsequently by any other single anthropologist.

The Golden Bough directed attention to the combination of priestly with kingly office in the "divine kingships" widely reported from Africa and elsewhere. According to Frazier, the institution of divine kingship derived from the belief that the well-being of the social and natural orders depended upon the vitality of the king, who must therefore be slain when his powers begin to fail him and be replaced by a vigorous successor.

In making a vast range of primitive custom appear intelligible to European thinkers of his time, Frazier had a wide influence among men of letters; and, though he traveled little himself, he was in close contact with missionaries and administrators who provided information for him and valued his interpretation of it. His other works include *Totemism and Exogamy* (1910) and *Folk-Lore in the Old Testament* (1918). He was knighted in 1914.

BIBLIOGRAPHY. Robert Ackerman, *J.G. Frazier: His Life and Work* (1987).

Frazier, E(dward) Franklin (b. Sept. 24, 1894, Baltimore, Md., U.S.—d. May 17, 1962, Washington, D.C.), American sociologist whose work on black social structure provided insights into and solutions to many of the problems affecting the black community.

Frazier received his A.B. from Howard University (1916) and his A.M. in sociology from Clark University (1920). After being awarded a fellowship to the New York School of Social Work (1920–21), he accepted an American-Scandinavian Foundation grant to study folk high schools and the Cooperative Movement in Denmark (1921–22). He taught sociology at Morehouse College, Atlanta, where he organized the Atlanta University School of Social Work (for blacks), later becoming its director. With the controversy surrounding the publication (1927) of "The Pathology of Race Prejudice" in *Forum*, Frazier was forced to leave Morehouse. He received a fellowship from the University of Chicago (1927), where he took his Ph.D. (1931). Publication of his thesis, *The Negro Family in Chicago* (1932), sustained the university's interest in his work on the black

family. He taught at Fisk University (1929–34) and then at Howard University (from 1934). He served as director of the Division of Applied Social Sciences UNESCO (1951–53), where he worked on the Tension and Social Change Project, assessing the interactions between people of different races and cultures and the effect of these interactions on each community. His writings include *The Negro Family in the United States* (1939), among the first sociological works on blacks researched and written by a black. He also wrote *Negro Youth at the Crossways* (1940) and *Race and Culture Contacts in the Modern World* (1957), which dealt with African studies.

Frazier, Joe, byname of JOSEPH FRAZIER (b. Jan. 12, 1944, Beaufort, S.C., U.S.), American world heavyweight-boxing champion from Feb. 16, 1970, when he knocked out Jimmy Ellis in five rounds in New York City, until Jan. 22, 1973, when he was beaten by George Foreman at Kingston, Jam.

After winning the Olympic Games heavyweight championship in 1964 in Tokyo, Frazier, a resident of Philadelphia, began his professional career in August 1965. In 1967 Muhammad Ali lost universal recognition as champion because he had refused to submit to U.S. military conscription. On March 4, 1968, in a title bout sanctioned by the New York State Athletic Commission and similar bodies in other states, Frazier knocked out Buster Mathis in 11 rounds. The following month, Ellis won a championship tournament (in which Frazier declined to participate) approved by the World Boxing Association. Frazier successfully defended his New York title four times before defeating Ellis.

On March 8, 1971, Frazier scored a 15-round decision over former champion Ali. Including this triumph, Frazier had, until his defeat by Foreman, won all 27 of his professional bouts, 23 by knockout. He retired in 1976 but staged an unsuccessful comeback attempt in 1981. A chunky man (5 feet 11 inches, 205 pounds) with an aggressive style and a powerful left hook, he was likened to an earlier heavyweight champion, Rocky Marciano.

Fréchet, (René-)Maurice (b. Sept. 2, 1878, Maligny, Fr.—d. June 4, 1973, Paris), French mathematician known chiefly for his contribution to real analysis. He is credited with being the founder of the theory of abstract spaces, which generalized the traditional mathematical definition of space as a locus for the comparison of figures; in Fréchet's terms, space is defined as a set of points and the set of relations in which those points are involved.

Fréchet was professor of mechanics at the University of Poitiers (1910–19) before moving to the University of Strasbourg, where he was professor of higher calculus (1920–27). Joining the faculty of the University of Paris,

he served as lecturer on the calculus of probabilities (1928–33), professor of general mathematics (1933–35), professor of differential and integral calculus (1935–40), and professor of the calculus of probabilities (1940–48).

In addition to his pioneering work on the theory of abstract spaces, Fréchet studied topology (the branch of mathematics dealing with the properties of a geometric figure that remain unchanged upon elastic deformation) and contributed notably to statistics and to differential and integral calculus.

His major works include *Les Espaces abstraits* (1928; "Abstract Spaces"); *Récherches théoriques modernes sur la théorie des probabilités* (1937–38; "Modern Theoretical Researches on the Theory of Probabilities"); *Les Probabilités associées à un système d'événements compatibles et dépendants* (1939–43; "The Probabilities Associated with a System of Compatible and Dependent Events"); *Pages choisies d'analyse générale* (1953; "Chosen Pages of General Analysis"); and *Les Mathématiques et le concret* (1955; "Mathematics and the Concrete").

Fréchette, Louis-Honoré (b. Nov. 16, 1839, Lévis, Que.—d. May 31, 1908, Montreal), pre-eminent French-Canadian poet of the 19th century, noted for his patriotic poems.

Fréchette studied law at Laval University, Quebec, and was admitted to the bar in 1864. Discharged as a journalist for liberal views, he went to Chicago (1866–71). There, he wrote *La Voix d'un exilé* (1866–68; "The Voice of an Exile"), a poem attacking the political and clerical dealings in Quebec in that period of Canadian confederation and voicing a patriotic idealization of the French republic. Returning to Lévis in 1871, Fréchette entered politics, representing that city in the federal House of Commons (1874–78) and from 1889 until his death acting as clerk of the provincial Legislative Council in Quebec City.

Fréchette made literary history when *Les Fleurs boréales* (1879; "The Northern Flowers") and *Les Oiseaux de neige* (1879; "The Snow Birds") were awarded the Prix Montyon in 1880, the first time the work of a Canadian had been honoured by the French Academy.

Fréchette

By courtesy of the Archives Nationales du Québec

A controversial representative of liberal nationalism, Fréchette then wrote *La Légende d'un peuple* (1887; "The Story of a Race"), his famous cycle of poems that was an epic chronicle of Canadian history. Other works include *Poésies choisies* (1908; "Selected Poems"); the prose stories in *Originaux et détraqués* (1892; "Eccentrics and Lunatics") and *Le Noël au Canada* (1899; *Christmas in French Canada*); the dramas *Félix Poutre* (1871), *Papineau* (1880), and *Véronica* (1908); and the polemic *Lettres à Basile* (1872).

freckle, also called EPHELIS, plural EPHELIDES, a small, brownish, well-circumscribed, stain-like spot on the skin, occurring most frequently in red- or sandy-haired individuals. In genetically predisposed individuals who have been exposed to the ultraviolet radiation of sunlight, production of the pigment melanin increases

in the pigment cells of the skin (melanocytes); the number of melanocytes does not increase. Freckles do not form on surfaces that have not been exposed to the sun. The freckles usually appear after the age of five and tend to fade somewhat in adults. Apart from avoiding sunlight, there is no known way of preventing them. They may, on occasion, be confused with pigmented nevi.

freckled duck (*Stictonetta naevosa*), rare Australian waterfowl, characterized by dark dots scattered over its metallic-gray plumage; in breeding season the drake's bill turns red. The freckled duck is a surface feeder. It lacks alarm calls, courtship display, and demonstrative pair bonds. It may constitute a separate tribe, *Stictonettini*, family Anatidae (*q.v.*; order Anseriformes). The duck has been classified as endangered by the Australian government, which has taken measures to protect it.

Fredegarius (fl. 7th century AD), the supposed author of a chronicle of Frankish history composed between 658 and 661. All the extant manuscripts of this chronicle are anonymous, and the attribution of it to "Fredegarius" dates from the edition of it by Claude Fauchet in 1579. The author set a fairly detailed history of his own times in the framework of a universal chronicle, drawing, for early Merovingian times, on information derived from the *Historia Francorum* of Gregory of Tours, which ends at the year 591, three years before Gregory's death. After 584 the so-called Fredegarius is an original source for events in the Frankish kingdoms until 642. Though written in barbarous Latin and excessively dull, it is of great importance because the author was writing of contemporary happenings and the chronicle is almost the sole literary source for this period. Differing hypotheses have been put forward concerning the nationality and career of the author; most students of the text consider him to be of Burgundian origin, but some suggest that he spent much of his life in Austrasia or at any rate that his sympathies were with the Austrasian mayors of the palace; others believe that he became an important official at the Neustrian court of Clotaire II.

Fredegund, French FRÉDÉGONDE (d. 597, Paris), queen consort of Chilperic I, the Merovingian Frankish king of Soissons.

Originally a servant, Fredegund became Chilperic's mistress after he had murdered his wife and queen, Galswintha (c. 568). Galswintha, however, was also the sister of Brunhild, the wife of Chilperic's half-brother Sigebert I, king of the eastern kingdom of Austrasia. Galswintha's murder engendered a violent animosity between Fredegund and Brunhild and an irreconcilable feud of more than 40 years' duration between the respective families. Fredegund was certainly responsible for the assassination of Sigebert in 575 and made attempts on the lives of Guntram (her brother-in-law and the king of Burgundy), Childebert II (Sigebert's son), and Brunhild.

After the mysterious assassination of Chilperic (584), Fredegund seized his riches and took refuge in the cathedral at Paris. Both she and her surviving son, Chlotar II, were at first protected by Guntram, but, when he died in 592, Childebert II, who had taken over his throne, attacked Chlotar, albeit unsuccessfully. From Childebert's death (595) until her own, Fredegund intrigued on Chlotar's behalf against Brunhild, who sought to rule through Childebert's sons, Theodebert II of Austrasia and Theodorik II of Burgundy. Ruthlessly murderous and sadistically cruel, Fredegund can have few rivals in monstrosity.

Frederic, Harold (b. Aug. 19, 1856, Utica, N.Y., U.S.—d. Oct. 19, 1898, Henley-on-Thames, Oxfordshire, Eng.), American jour-

nalist, foreign correspondent, and author of several historical novels.

Interested at an early age in photography and journalism, Frederic became a reporter and by 1882 was editor of the *Albany Evening Journal*. In 1884 he went to London as the correspondent for *The New York Times*. He remained there for the rest of his life. In 1884 he made a hazardous tour investigating outbreaks of cholera in southern France and Italy. In 1891 he visited Russia to investigate the persecution of the Jews.

His historical novels range from the American Revolution (*In the Valley*, 1890) to the American Civil War (*The Copperhead*, 1893, and *Marsena and Other Stories*, 1894). Of

Frederic, engraving

his New York State novels, *The Damnation of Theron Ware* (1896; English title *Illumination*), the story of the decline and fall of a Methodist minister, brought him his greatest fame. Three other novels, *March Hares* (1896), *Gloria Mundi* (1898), and *The Market Place* (1899), are about English life.

Fredericia, city and port, *Vejle amtskommune* (county commune), eastern Jutland, Denmark, on the Little Strait, there bridged to Fyn (Funen) island. Founded and chartered in 1650 by Frederick III as a fortress to defend Jutland, it enjoyed special privileges, including freedom of worship and exemption from taxes. After a destructive siege in 1849, the Danes drove off the allied Prussians and Schleswig-Holsteiners, leading to a truce; the original earthen ramparts remain, and the common grave of the defenders is in the cemetery of Trinitatis Church (1689). In contrast to other Danish cities, all streets in the old part of Fredericia are laid out in a grid. Still a garrison town, Fredericia is a rail junction and exports silverware, frozen fish, textiles,

Section of the earthen ramparts surrounding Fredericia, Den.

Le-Be

tobacco, and machinery. The establishment of an oil industry in the 1960s extended the city's industrial base. It is the site of the annual Danish industries fair. Pop. (1985 est.) city, 28,198; (1986 est.) mun., 45,803.

BOHEMIA

- **Frederick I:** see Frederick V (Palatinate).

BRANDENBURG

- **Frederick I** (b. between August and November 1371, Nürnberg [Germany]—d. Sept. 20, 1440, Cadolzburg, near Nürnberg), elector of Brandenburg from 1417, founder of the Brandenburg line of Hohenzollern.

He was the second son of Frederick V, burgrave of Nürnberg. After his father's death, in 1398, he obtained Ansbach and, in 1420, on the death of his elder brother John, the principality of Bayreuth. In 1410 Sigismund, younger son of the Holy Roman emperor Charles IV, had appointed Frederick his representative in the election for the German throne, authorizing him to cast the Brandenburg vote. Frederick succeeded in having Sigismund elected German king and as a reward was appointed a governor of Brandenburg (July 8, 1411). He was formally given the electorate and margravate by Sigismund in 1417. In 1425 Frederick handed over the control of Brandenburg to his eldest son, John the Alchemist, returned to Franconia, and devoted the rest of his life to imperial affairs. Active in the negotiations with the Hussites as a champion of religious moderation, he helped bring about the pacts of Prague (1433) and Iglau (1436). He took part in the election of Frederick III as German king in 1440.

- **Frederick III:** see Frederick I (Prussia).

DENMARK

- **Frederick I** (b. Oct. 7, 1471, Denmark—d. April 10, 1533, Gottorp, Schleswig), king of Denmark (1523–33) and Norway (1524–33) who encouraged Lutheranism in Denmark but maintained a balance between opposing Lutheran and Roman Catholic factions. This equilibrium crumbled after his death.

The younger son of Christian I, king of Denmark and Norway, Frederick divided the duchies of Schleswig (now in Germany and Denmark) and Holstein (now in Germany) in 1490 with his older brother John, who succeeded to the Danish throne in 1481. After failing to win sovereignty over half of Norway and parts of Denmark, Frederick settled in Gottorp, where he reformed the territory's administration. He remained hostile to King John and to the king's son Christian II, who succeeded to the Danish throne in 1513.

Frederick accepted an offer of the crown from the Jutland nobles who led a revolt against Christian II in 1522. He was crowned the following year and carefully attempted to appease both the higher nobles and the peasants. He was also accepted as king of Norway in 1524 but continued to live in Gottorp, claiming his Danish revenues were inadequate.

Although Frederick at first agreed with the Catholic nobles to fight the Lutheran "heresy," he gave increasing support to Lutheran preachers in Denmark, particularly to Hans Tavsén, who became the king's chaplain. His pro-Lutheran policy, which increased his popularity among the peasants, was probably designed to increase royal power at the expense of the Danish church.

Frederick I, detail of an oil painting by Jacob Binck, 1539; in Frederiksborg Castle, Denmark

Frederick nevertheless retained the support of the Rigsråd (state council) against the exiled Christian II, who invaded Norway in 1531 and threatened to reclaim the Danish realm with the aid of the Holy Roman emperor Charles V. Frederick imprisoned Christian, reached a diplomatic settlement with Charles V, and maintained peace until his death. The Roman Catholic cause was clearly on the wane, however, and was thoroughly defeated in 1536.

- **Frederick II** (b. July 1, 1534, Haderslev, Den.—d. April 4, 1588, Antvorskov), king of Denmark and Norway (1559–88) who failed in his attempt to establish complete Danish hegemony in the Baltic Sea area in the Seven Years' War of the North (1563–70) but main-

Frederick II, detail from a portrait by Hans Knieper, 1581

tained enough control over the Baltic trade to guide Denmark to a period of prosperity in the later years of his reign.

After joining his uncles John and Adolphus, dukes of the Danish provinces of Schleswig and Holstein, in June 1559 in conquering the peasant republic of Dithmarschen (now in Germany), Frederick succeeded his father, Christian III, in 1559 as king of Denmark and Norway. His competition with Sweden for supremacy in the Baltic broke out into open warfare in 1563, the start of the Seven Years' War of the North. Frederick hoped to take over Sweden and resurrect the Kalmar Union of Denmark, Norway, and Sweden. He was unable to gain any military advantage in the war, however, and reluctantly signed the Peace of Stettin with Sweden in 1570. Sweden remained independent and shared control of Baltic coastal territories with Denmark.

In the postwar years of his reign, Frederick concentrated on rebuilding Denmark's damaged economy and defenses. His chief adviser, Peder Okse, taxed the nobles and successfully maintained the toll Denmark imposed on shipping through The Sound (Øresund) to the Baltic Sea, a route crucial to the economies of the major north European nations. The toll revenues provided a key support for the Danish economy, which then also benefited from reduced competition from the trading

centres of the Hanseatic League (a north German trading confederation). Maintaining Danish control of the Baltic waters, Frederick cleared pirates from the seas adjacent to Denmark and built Kronborg Castle at Elsinore to guard The Sound. Also a great patron of science and the arts, he granted the Danish astronomer Tycho Brahe the island of Ven, near Copenhagen, and gave him the means to found an observatory there.

• **Frederick III** (b. March 18, 1609, Haderslev, Den.—d. Feb. 9, 1670, Copenhagen), king of Denmark and Norway (1648–70) whose reign saw the establishment of an absolute monarchy, maintained in Denmark until 1848.

In his youth Frederick served successively as bishop coadjutor (*i.e.*, assistant bishop with the right of succession) of the German dioceses of Bremen, Verden, and Halberstadt. He commanded Danish forces in Schleswig-Holstein during Denmark's disastrous war with Sweden (1643–45) and succeeded to the throne shortly after the death (1648) of his father, Christian IV, agreeing to a charter that reduced the royal prerogatives.

Frederick III, detail from a portrait by Karel van Mander III

In 1655 the Swedish king Charles X Gustav went to war with Poland, and in 1657 Frederick launched an invasion of Sweden. His plans for regaining the Danish territories lost in 1645 were shattered when Charles suddenly seized the Danish province of Jutland and threatened Sjælland. Shortly afterward Frederick signed the Treaty of Roskilde (Feb. 26, 1658), by which Denmark ceded to Sweden the provinces of Skåne, Blekinge, and Halland, the island of Bornholm, and the Norwegian province of Trondheim.

Within five months Charles again invaded Denmark. The tide of the war turned in favour of Denmark when the inhabitants of Copenhagen resisted a Swedish siege. Assisted by a Dutch squadron, the Danish fleet was then able to drive the Swedes away from The Sound (Øresund), and by the Treaty of Copenhagen (1660) Denmark recovered Bornholm and Trondheim.

Frederick called a meeting of the Estates in September 1660 to meet the debts incurred in the war. The clergy and the townsmen forced the Rigsråd (state council) and nobility to give up their fiscal privileges, to negotiate with the King for a new constitution, and to recognize Frederick as hereditary sovereign, nullifying his royal charter. In January 1661 the government issued a decree conferring absolute power on the king. The new constitution was signed in November 1665, but the King's Law, or Kongeloven, written by Peder Schumacher, later Count Griffenfeld, confirming the king's absolute authority, was not made public until 1709.

With the aid of his adviser Hannibal Se-

hested, Frederick introduced sweeping reforms of the state administration. These included a reorganization of the government into five departments, or "colleges," with policy recommendations being made by the Privy Council, the members of which were usually selected from the heads of the colleges. The bourgeoisie gained greatly in power, buying the major part of the royal estates and, for the first time, holding important government positions.

• **Frederick IV** (b. Oct. 11, 1671, Copenhagen—d. Oct. 12, 1730, Odense, Den.), king of Denmark and Norway (1699–1730), who succeeded his father, King Christian V. He

Frederick IV, detail of an oil painting by Hyacinthe Rigaud; in Frederiksborg Castle, Denmark

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

continued the Danish efforts to sever the House of Gottorp's link with Sweden, but his first attempt to do so, in 1700 at the outbreak of the Great Northern War, was checked by Charles XII of Sweden. Frederick then accepted the Treaty of Traventhal (1700), but he reentered the war in 1709, and at the Peace of Frederiksborg (1720) Denmark obtained English and French guarantees for the sole possession of the Duchy of Schleswig by the Danish crown, though remaining administratively separate. At home the King introduced reforms. A local militia was instituted in 1701. Serfdom in Sjælland was partially abolished after 1702. On the crown estates Frederick reorganized defense measures and established 240 elementary schools. His private life, however, often aroused indignation. Having married Louise of Mecklenburg-Güstrow in 1695, he entered into twomorganatic marriages during her lifetime. The second of these, in 1712, was with Anna Sophie, daughter of the chancellor, Conrad, Count Reventlow, and after Louise's death (1721), despite opposition within the royal family, he raised Anna Sophie to the dignity of queen.

• **Frederick V** (b. March 31, 1723, Copenhagen—d. Jan. 14, 1766, Copenhagen), king

Frederick V, detail from an oil painting by C.G. Pilo, 1751

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

of Denmark and Norway (1746–66) from the death of his father, Christian VI. The reign of this likable but ineffective king was marked by Danish neutrality in the Seven Years' War (1756–63) and a consequent improvement in the nation's foreign trade; by a narrow escape from war with Russia (1762); and by government-sponsored reforms in farming methods (from 1757, when an agricultural commission was established). In addition, the arts flourished without pietistic restraint. Real power was exercised in Frederick's name by two outstanding ministers, Adam Gottlob, Count Moltke, and J.H.E. von Bernstorff.

In 1743 Frederick married Louisa, a daughter of King George II of England. After her death (1751) the King in 1752 married Juliana Maria of Brunswick-Wolfenbüttel.

• **Frederick VI** (b. Jan. 28, 1768, Christiansborg Castle, Denmark—d. Dec. 3, 1839, Copenhagen), king of Denmark from 1808 to 1839 and of Norway from 1808 to 1814.

The son of the mentally incompetent king Christian VII and Queen Caroline Matilda, Frederick was reared largely by his father's stepmother, the queen dowager Juliana Maria, who, with her son Prince Frederick and Ove Høegh-Guldberg, virtually ruled Denmark until 1784. In April of that year the Crown Prince brought about changes in the government that transferred the real power to him.

Frederick VI, detail from a portrait by C.W. Eckersberg

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

Frederick supported reform measures to grant personal liberty and legal protection to the peasants and instituted several other social and economic reforms. Married in 1790 to Maria Sophia Frederica, daughter of the landgrave Charles of Hesse, Frederick acceded to the throne upon his father's death on March 13, 1808.

After his accession he inclined more to personal rule, and the cabinet's influence decreased. Initially neutral in the Napoleonic Wars, Frederick supported Napoleon after the English bombardment of Copenhagen in 1807. An indifferent diplomat, he supported Napoleon too long and failed to take advantage of Sweden's difficulties in 1809. At the Peace of Kiel (January 1814), he had to cede Norway to Sweden and Heligoland to England. In the lean years following the Congress of Vienna, Frederick proved himself an energetic, responsible, and upright "father of his country." Under the influence of the July Revolution of 1830 in France, Frederick, in 1834, set up four consultative provincial assemblies. This action marked the beginning of parliamentary life in Denmark.

• **Frederick VII** (b. Oct. 6, 1808, Amalienborg Castle, Denmark—d. Nov. 15, 1863, Glücksburg Castle), king of Denmark from 1848 who renounced absolute rule and adopted a representative government.

The son of the future king Christian VIII and Charlotte of Mecklenburg-Schwerin, Frederick in 1839 was appointed governor of the island of Fyn. As a crown prince, he had two un-

Frederick VII, detail of an oil painting by D. Monies, 1847; in Frederiksborg Castle, Denmark

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

happy marriages: first, in 1828, to his second cousin Wilhelmina Maria, a daughter of Frederick VI (dissolved in 1837); then, in 1841, to Caroline of Mecklenburg-Strelitz (dissolved in 1846).

On Jan. 20, 1848, Frederick succeeded his father. After the popular demonstrations of March 1848, he appointed a Liberal ministry and on June 5, 1849, he signed the Danish constitution, which provided for a bicameral legislature. The constitutional issue, however, was overshadowed by the Schleswig-Holstein question. Frederick rejected a proposal for partitioning Schleswig (1848) and ceding the southern portion to Prussia. Instead, he incorporated it into the Danish state. The Schleswig Germans then sought and received Prussian aid in a rebellion against Danish rule, which Denmark put down between 1848 and 1850.

Frederick's third wife, Louise Christine Rasmussen, whom he married morganatically in 1850, sided with the Bondevenner (Friends of the Peasants Party). Frederick himself came increasingly into conflict with the National Liberals, who from 1854 held more Cabinet posts. The conflict centred on the succession to the throne (the childless King named Christian of Glücksburg as his successor) and around the constitutional problem of Frederick's favouring a joint constitution for all the lands under the crown.

Just two days before Frederick died, a joint constitution for Denmark and the Duchy of Schleswig was ratified by the Rigsråd, a decision that precipitated war with the German powers in 1864.

• **Frederick VIII** (b. June 3, 1843, Copenhagen—d. May 14, 1912, Hamburg), king of Denmark in 1906–12.

Frederick VIII, detail from a portrait by Otto Bache, 1911

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

Frederick served in the disastrous Danish-German War of 1864, which lost the duchies of Schleswig, Holstein, and Lauenburg for Denmark. He then assisted his father, Christian IX, in affairs of state. In 1907, as king, he formed a commission to draft a partial home rule bill for Iceland, but nothing came of it. Frederick VIII's popularity was based on his sincerity in politics, his congeniality, and his simple life-style.

• **Frederick IX** (b. March 11, 1899, Sorgenfri Castle, near Copenhagen—d. Jan. 14, 1972, Copenhagen), king of Denmark (1947–72) who gave encouragement to the Danish resistance movement against the German occupation during World War II and, along with his father, Christian X, was imprisoned by the Germans (1943–45). A highly popular monarch, he maintained the ties of affection between the people and the royal house.

The eldest son of the future king Christian X and Alexandrine of Mecklenburg-Schwerin, Frederick became crown prince in 1912 and joined the Danish Navy in 1917. He rose to the rank of commander by 1935 and in 1946 became rear admiral. He married Ingrid (also in 1935), the only daughter of the crown prince Gustaf Adolf of Sweden; their children were Margrethe, Benedikte, and Anne-Marie.

Frederick IX, detail from an oil painting by Johannes Glob, 1954

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

Frederick acted as regent for his father in 1942 and 1947 and succeeded to the throne on his father's death on April 20, 1947. In June 1953 he signed a new constitution that provided for female succession to the throne and reduced Parliament to one house. In 1964 his daughter Anne-Marie married King Constantine II of Greece, who was exiled in 1967. On his death in January 1972, Frederick was succeeded by his daughter Margrethe.

GERMAN EMPIRE

• **Frederick III**, also called (until 1888) CROWN PRINCE FREDERICK WILLIAM, German KRONPRINZ FRIEDRICH WILHELM, in full FRIEDRICH WILHELM NIKOLAUS KARL (b. Oct. 18, 1831, Potsdam, Prussia—d. June 15, 1888, Potsdam), king of Prussia and German emperor for 99 days in 1888, during which time he was a voiceless invalid, dying of throat cancer. Although influenced by liberal, constitutional, and middle-class ideas, he retained a strong sense of the Hohenzollern royal and imperial dignity.

The son of the future king and emperor William I and Augusta of Saxe-Weimar-Eisenach, he was the first Prussian prince to attend a university; he received a thorough military education as well. In 1858 he married the British princess royal, Victoria (1840–1901; from 1888 called the "empress Frederick"). Despite the influence of his wife's liberal ideas, he favoured a strong central government and at times exceeded the prime minister and chancellor, Otto von Bismarck, in willingness to exert pressure on the allied German princes.

As crown prince from 1861, Frederick spent

Frederick III, 1884

By courtesy of the Staatsbibliothek, Berlin

27 years chiefly in waiting to do something. Thanks to his chief of staff, Leonhard von Blumenthal, he was a successful commander in the Danish War of 1864, the Seven Weeks' War of 1866, and the Franco-German War of 1870–71. Although Frederick supported Bismarck in the war of 1866, in general the "blood and iron" aspects of Bismarck's domestic and international policies were alien to him.

In 1887 Frederick showed symptoms of cancer of the throat. Although the disease was correctly diagnosed as such by German doctors, the British specialist Sir Morell Mackenzie advised against an operation (scheduled for May 21, 1887, and cancelled). A tracheotomy in February 1888 was too late. The Crown Prince, who became emperor on March 9, by this time was able to do little. His only significant official act was to dismiss the minister of the interior, Robert von Puttkamer, an extreme conservative.

Frederick was succeeded by his son and heir, William II.

GERMANY/HOLY ROMAN EMPIRE

• **Frederick I**, byname FREDERICK BARBAROSSA (Italian: Redbeard) (b. c. 1123—d. June 10, 1190, Kingdom of Armenia), duke of Swabia (as Frederick III, 1147–90) and German king and Holy Roman emperor (1152–90), who challenged papal authority and sought to establish German predominance in western Europe. He engaged in a long struggle with the cities of northern Italy (1154–83),

Frederick I as a crusader with (right) Henry of Schäftlarn dedicating to him a copy of the *History of the First Crusade* by Robert of St. Remy; miniature from a manuscript in the Vatican Library (Vat. Lat. 2001)

By courtesy of the Biblioteca Apostolica Vaticana

sending six major expeditions southward. He died while on the Third Crusade to the Holy Land.

Early years. Frederick was the son of Frederick II, duke of Swabia, and Judith, daughter of Henry IX, duke of Bavaria, of the rival dynasty of the Welfs. After succeeding his father as duke of Swabia, Frederick was elected German king on March 4, 1152, in Frankfurt, succeeding his uncle, Emperor Conrad III. Frederick's contemporaries believed that, because he united in himself the blood of the Welfs and the Hohenstaufen, he would solve the internal problems of the kingdom. The announcement of his election, which he sent to Pope Eugenius III, made it plain that Frederick I was not ready to recognize the preeminence over the emperors that the popes had won during the quarrel over the right of investiture of bishops and abbots. Frederick, moreover, filled several vacant episcopal sees, thereby violating the Concordat of Worms of 1122. Nevertheless, he was to learn that he could not prevail against the papacy as easily as the earlier emperors, Otto I and Henry III, had done because the political balance of the West had changed. Under the powerful emperor Manuel I Comnenus, the Byzantine Empire had grown to be a political factor in the Mediterranean and in Italy. Southern Italy and Sicily were united in the Norman kingdom of Roger II. The cities of the Lombards, which had been little more than a nuisance to the earlier emperors, had now become invincible.

Frederick started his struggle for the old goal of the predominance of the Empire over the European monarchies with great political skill. By not recognizing the treaty of alliance between his predecessor, Conrad III, and Manuel I Comnenus of Byzantium against Roger II of Sicily, Frederick forced Pope Eugenius III to sign the Treaty of Constance (1153) with him because the Pope was more exposed to pressure from the Norman kingdom to the south as well as from Arnold of Brescia in Rome. Frederick promised not to make peace with the Roman commune, headed by Arnold (whom he hanged) or with the Normans without the agreement of the Pope. He also promised not to concede any Italian land to the Byzantine Emperor and, finally, to maintain the position of the papacy (*honor papatus*). Eugenius III, on his part, promised that Frederick would receive the imperial crown and that the rights of the empire would be maintained. When Manuel of Byzantium offered Frederick a Byzantine princess as wife and attempted to induce him to fight against the Norman kingdom, Frederick refused. The successor of Eugenius III, Pope Adrian IV, honoured the Treaty of Constance and crowned Frederick emperor on June 18, 1155, in Rome.

The German princes refused to give Frederick the support necessary to attack the Sicilian kingdom, which, under Roger's son William I (reigned 1154-66), was passing through a crisis. Although Manuel now formed an allegiance with the rebellious Norman barons, the city of Genoa, and the Pope, Adrian still would not accept the Byzantine offer of help against William I of Sicily. After William had brought his crisis to an end, he was able to force the Pope to sign the Concordat of Benevento in 1156 by which Adrian gave William Sicily and the Norman principalities on the mainland as far north as Naples and Capua and granted him special rights for the Sicilian church. This new treaty was in violation of the Treaty of Constance. Cardinal Roland (later Pope Alexander III) was supposed to explain the Pope's new policy to the princes and to the Emperor at the imperial Diet of Besançon 1157. A letter from the Pope, which was translated in an inflammatory manner by the imperial chancellor Rainald of Dassel, caused a critical argument between the papal delegation and the German princes over whether

or not the empire was dependent upon the papacy. Adrian explained later that he meant the word *beneficium*, which had caused all the trouble, to mean benefit and not fief.

Attempt to regain imperial rights. In 1158, after Frederick had solved several decisive domestic problems (see below), he began his second campaign in Italy, seeking the complete restoration of the imperial rights. After laying siege to and conquering Milan, which had attempted to oppose him, Frederick opened the Diet of Roncaglia. The goal of this Diet was to define and guarantee the rights of the emperor, which would bring the empire an estimated 30,000 pounds of silver per year. Frederick attempted, beginning in 1158 and especially after 1162, not only to achieve the granting of these rights but also to put a systematic financial administration into effect. His goal was to reduce imperial Italy to a system of well-controlled castles, palaces, and cities, with the self-government of the cities controlled by imperial officials. What the Emperor saw as a restoration of the imperial rights, however, was considered by the cities as a curtailment of their freedom. A tax called the *fodrum* was levied on all the inhabitants of imperial Italy; in return the Italian nobles and communes were excused from service in Frederick's armies and were guaranteed his protection. A portion of the Italian money went to the German princes; this enabled Frederick to win their support without making too many political concessions to them in Germany. The ecclesiastical princes of the empire, however, still had to render full service for Italy; the archbishopric of Mainz suffered severe financial losses because Archbishop Christian was active for a long time in Italy as imperial legate. The Italian taxes allowed Frederick to enlist mercenaries (Brabantini) in order to free himself militarily, to a certain extent, from the fief holders. The money of Italy was not, however, the only motive of Frederick's Italian policy.

The Pope, as well as the cities, felt threatened by a tightly organized imperial state in Italy. In 1159 Cardinal Octavian was elected Pope Victor IV with the support of Frederick, and Cardinal Roland was elected Pope Alexander III in a tumultuous and disputed voting session. Alexander, supported by many cardinals, was also immediately recognized by William of Sicily as the true pope. At the council of 1160 in Pavia, convened by the Emperor, only Victor IV was present and was declared the rightful pope, thereby earning Alexander's hostility.

Relations with Pope Alexander III. Alexander III, one of the greatest lawyers of the church, wanted to found a papacy that would be independent of the Emperor; he excommunicated Frederick in 1160. France, England, Spain, Hungary, the Lombards, and even Emperor Manuel joined Alexander's party; Alexander retired to France in 1161, where he remained until 1165. John of Salisbury asked at that time: "Who made the Germans judges of the nations?" Barbarossa's attempt to persuade King Louis VII of France to try to heal the schism when they met at Saint-Jean-de-Losne on the Saône was of no avail. Alexander attempted to bring Frederick back into the church but with no success. At Alexander's urging, the Byzantine emperor Manuel Comnenus now prepared to form an alliance with France and was ready to recognize the Pope. In 1162 Milan was destroyed by Frederick.

When Victor IV died in 1164, Paschal III (reigned 1164-68) was quickly elected as the new imperial pope on the urging of Rainald of Dassel, perhaps against the will of the Emperor. Because of friction between Louis VII and Henry II of England and because the latter was embroiled in an argument with Thomas Becket, Barbarossa decided to form an alliance with Henry II. At the Diet of 1165 in Würzburg, Frederick swore not to recog-

nize Alexander III. The promises made by the English delegates that Frederick's political wishes would be recognized were denied by Henry II, who preferred to keep Alexander under pressure, thus making things more difficult for Becket.

Following the death of William I of Sicily in 1166, Frederick felt that the time had come to strike a decisive blow against Alexander III, who had returned to Rome, and against Sicily. The Lombard League was formed to defend against the Emperor's fourth expedition to Italy. Frederick's expedition ended in disaster, however, when malaria broke out in his army. Rainald of Dassel died in Rome at this time, causing a change in the imperial strategy. When Frederick negotiated peace between Louis VII and Henry II and then sent the Bishop of Bamberg in 1170 to Alexander III and envoys to Byzantium, a détente resulted that even Alexander could not escape. In his fifth Italian campaign (1174) Frederick did not defeat the Lombards militarily, but they were forced to subject themselves to him in the Armistice of Montebello. Because Duke Henry the Lion of Saxony refused to come to his aid, however, Frederick lost the Battle of Legnano against the Lombards. He was now ready to deal with the Pope, and in 1176 they signed the Treaty of Anagni. In the Peace of Venice (1177) Barbarossa acknowledged Alexander III as the true pope. In front of the Church of St. Mark's, Barbarossa received the kiss of peace from the Pope. At Venice the imperial delegates had been able to improve the Emperor's position. Above all was the fact that, although a truce had been negotiated with the Lombards, they were not included in the peace treaty. A treaty with the Lombards was finally confirmed in the year 1183.

Barbarossa meanwhile had also initiated sweeping changes in his empire, where Duke Henry the Lion of Saxony was the strongest prince next to him. When Barbarossa took office, Henry had laid claim to Bavaria, the domain of the margrave Henry II Jasomirgott of Austria. Barbarossa bestowed Bavaria on Henry the Lion, and as compensation he elevated the margravate to a dukedom, with special rights. The Emperor also left the dukedom of Saxony and Mecklenburg under Henry the Lion's control, and in 1154 the Duke received the privilege of investing bishops in the colonial land east of the Elbe. The year 1158 was of great importance for the empire; Barbarossa founded the imperial territory of Pleißenland (south of Leipzig), elevated Duke Vladislav II of Bohemia to king, and granted the Archbishop of Bremen important privileges, restoring the Bishop's lost political power. Also in 1158 Frederick promised to enfeoff Waldemar I the Great of Denmark—that is, make him his vassal with certain rights.

Meanwhile, Henry the Lion founded the cities of Munich and Lübeck (1158). The founding of Lübeck brought German merchants to the Baltic Sea. The Duke closed a contract between the Germans and the inhabitants of Gotland and sent envoys to Scandinavia and Russia. A trade agreement was closed in 1189 with Novgorod. About 1180 German merchants reached Riga; their advance was protected by Henry's conquest of Mecklenburg (1177). By 1148 Henry had the county and the town of Stade, the most important harbour on the Elbe, in his control.

Deposition of Henry the Lion. At the same time German colonists had settled in Brandenburg under the margrave Albert I the Bear and in Silesia. Barbarossa had restored the dependence of the Polish dukes during two expeditions to Poland in 1157 and 1172. Henry the Lion, the most powerful prince in northern Germany, made Brunswick his res-

idence. He had repeatedly challenged other princes in feuds, but Archbishop Wichmann of Magdeburg, Albrecht of Brandenburg, Landgrave Louis III of Thuringia, and Archbishop Rainald of Cologne offered repeated resistance. It is not completely certain that Duke Henry's refusal of aid to Frederick in 1176 was the sole cause of his downfall. Apparently his manifold breach of the peace of the land caused the Emperor to accuse him, to conquer Lübeck, and, in 1180, through a council of the princes in Gelnhausen, to depose him. Henry lost his dukedom; Westphalia was given to the Archbishop of Cologne, and Bavaria was granted to Otto of Wittelsbach. Henry, who was married to Mathilde of England, went in exile to King Henry II of England. As a result of Henry the Lion's trial, the feudal system was made a still stronger basis of the imperial constitution. Thereafter, only those princes who had received their land directly from the Emperor were admitted to the exclusive circle of imperial princes (*Reichsfürsten*). Barbarossa elevated the princes of Pomerania to dukes, and the counts of Andechs became the dukes of Merania (in the neighbourhood of Trieste). Steiermark became a dukedom. Another important measure of Barbarossa was the elevation of the Bishop of Würzburg to duke of Franconia in 1168.

Barbarossa had attempted to hold the increasing power of the princes in check. By 1152 he had found a solution for the area of Burgundy, which also belonged to the empire. He made Duke Berthold IV of Zähringen his representative for the dukedom of Burgundy as far as the Mediterranean and married Béatrix, the daughter of Count Rainald of Burgundy (1156). Barbarossa attempted to build his own imperial territory between the areas controlled by the princes. This territory was composed of castles, cities, landholdings, ministerial seats, and single rights that were more or less thickly scattered from Swabia to Thuringia. This large territory was ruled by imperial ministerials (*ministeriales imperii*). These men had great power because many of them belonged to the Emperor's circle. The most famous of them was Kuno of Münzenberg, whose castle is preserved in the Wetterau north of Frankfurt and who founded the town of Friedberg. The territorial "peace laws" belong to his efforts to keep the Emperor in power.

Chivalry gave Barbarossa's time a special stamp. He expressed his enthusiasm for knight-hood as the ideal way of life at the festival of Pentecost at Mainz in 1184, where he dubbed his sons knights. This festival was surpassed by the "Diet of Jesus Christ" in 1188, when the margrave of Namur was transformed into an imperial principality. More important was Barbarossa's call to the Third Crusade in the spring of 1189 to free Jerusalem from Saladin's army, which had captured it in 1187. Before his departure he returned the former possessions of the Countess Mathilde of Tuscany, a part of the papal state, to the Pope. In 1190 the Emperor drowned while trying to cross the Saleph River.

Assessment. Frederick Barbarossa had attempted to continue the imperial policy of the rulers of the Saxon and Salian lines. His state was still founded upon the noble, the high noble, and above all the newly founded rank of the imperial servants. The imperial cities in Germany were governed by royal officials (*advocatis sculteti*), and the citizens had their part in the government. The cities played no role in politics. Frederick had to recognize that the church, after the quarrel of investiture, had become a firmly controlled institution, with its powers strictly defined by law. The church had joined itself to the struggle for freedom of the economically powerful states in upper Italy. Pope Alexander III was

able to force the kings of Europe (especially Louis VII of France) not to enter into a political agreement with Barbarossa. Only Philip II Augustus of France signed a treaty with Barbarossa in order to free himself from the pressures created by the Anglo-Norman occupation on the mainland. There was no chance that a continuation and increase of the imperial policy in the territories controlled by the empire would have broken the power of the princes. Germany developed into a system of territorial states after Barbarossa's death, while France developed during the time of Philip II Augustus into a centralized monarchical state. Barbarossa had a strong feeling for law and imperial prestige. His steadfast opposition to the popes and to Henry the Lion made him the symbol of German unity in the romantic glorification of the 19th century. People since the 14th century believed he was sleeping in the imperial castle of Kyffhäuser and hoped for his return. A monument to him was erected there during the years 1890-96.

(H.Pa.)

BIBLIOGRAPHY. The chief contemporary source of Frederick's life is *Otonis episcopi frisingensis Gesta Frederici*, I, ed. by Georg Waitz and B. von Simson (1912; *The Deeds of Frederick Barbarossa*, by Otto of Freising and His Continuator, Rahewin, 1953). H. Simonsfeld, *Jahrbücher des deutschen Reiches unter Friedrich I.*, vol. 1—until 1158 only (1908), documents all that is known about Barbarossa. Peter Munz, *Frederick Barbarossa* (1969), is a good English-language biography, although some points are subject to dispute. Alfred Haverkamp, *Herrschaftsformen der Frühstaufer in Reichsitalien*, 2 vol. (1970-71), is an important book on the constitutional and financial history of Frederick in Italy.

• **Frederick II** (b. Dec. 26, 1194, Jesi, Ancona, Papal States—d. Dec. 13, 1250, Castel Fiorentino, Apulia, Kingdom of Sicily), king of Sicily (1197-1250), duke of Swabia (as Frederick VI, 1228-35), German king (1212-50), and Holy Roman emperor (1220-50). A Hohenstaufen and grandson of Frederick I Barbarossa, he pursued his dynasty's imperial policies against the papacy and the Italian city states; and he also joined in the Sixth Crusade (1228-29), conquering several areas of the Holy Land and crowning himself king of Jerusalem (reigning 1229-43).

Early years. In 1196, Frederick, at the age of two, was elected king by the German princes at Frankfurt. His father, however, failed in his attempt to gain the princes' support to make Frederick's succession hereditary. Just before embarking on a crusade to the Holy Land,

Emperor Henry died in September 1197 after a brief illness, only 32 years old. Though the medieval Roman Empire was at the height of its strength, the Emperor's death brought it close to dissolution.

After the death of her husband, Empress Constance had young Frederick brought to Sicily, where in May 1198 he was crowned king of Sicily. Before her death later that year, Constance loosened the bonds that joined Sicily to the empire and to Germany by appointing Pope Innocent III her son's guardian as well as regent of the Kingdom of Sicily, which was already under papal suzerainty. In Germany two rival kings were elected, Frederick's uncle Philip of Swabia and Otto of Brunswick, as Otto IV.

Even the Pope, however, did not succeed in protecting Sicily from many years of anarchy. German and papal captains, local barons, and Sicilian Saracens, as well as the cities of Genoa and Pisa, fought for mastery of the country. The situation was not stabilized until the imperial chancellor conquered Palermo in November 1206 and governed in Frederick's name. In December 1208 Frederick, then 14, was declared of age.

In 1209 he married the much older Constance of Aragon, who brought him an urgently needed troop of knights with whose help he gained control of Sicily, defeated a conspiracy of the barons, and was partially successful in regaining the crown properties that had been lost during his minority. At this time his relations with the Pope began to show signs of strain.

Frederick's Sicilian efforts were seriously endangered when at the end of 1210 Otto IV invaded the realm on the mainland and in 1211 even threatened Sicily itself. Otto withdrew, however, when in September 1211 a number of German princes deposed him and elected Frederick king.

Before leaving for Germany in March 1212, Frederick had his one-year-old son Henry VII crowned king of Sicily and granted various privileges to the Holy See. Having rapidly conquered south Germany, where he met almost no opposition, Frederick was elected once again king of Germany by a large majority of princes at Frankfurt in December 1212 and crowned a few days later. In the same year he concluded an alliance with France against Otto, who was decisively defeated at the Battle of Bouvines in July 1214.

Consolidation of the empire. In April 1220 Frederick's nine-year-old son Henry VII was elected king by the German princes, thus negating Frederick's promise to Pope Innocent that he would relinquish control of Sicily in favour of Henry, for it meant that Sicily and Germany would eventually be united under one ruler. Although Frederick sought to exonerate himself with Pope Honorius III by claiming that the election had been held without his knowledge, he had to pay for it by surrendering extensive royal prerogatives to the German ecclesiastical princes.

Crowned emperor by the Pope in St. Peter's Church, in Rome, on Nov. 22, 1220, Frederick confirmed on the same day the legal separation of the empire from the Kingdom of Sicily while continuing the existing personal union. In addition, he granted important privileges to the Italian ecclesiastics and issued laws against heretics, and it seemed indeed that harmony had been reestablished between the Emperor and the Pope for some years to come. Frederick spent the following years consolidating his rule in Sicily. He broke the resistance of the barons to revocation of certain of their privileges and defeated the rebellious Saracens (1222-24), whom he later resettled in Apulia where they became his most faithful subjects, providing him with a loyal bodyguard immune against papal influence.

In addition to erecting a chain of castles and border fortifications, he had enlarged the har-

Frederick II, with a falcon, miniature from his treatise, *De arte venandi cum avibus*; in the Vatican Library (MS. Palat. Lat. 1071)

By courtesy of the Biblioteca Apostolica Vaticana, Rome

bours of his kingdom and established a navy and a fleet of merchant vessels. He instituted measures designed to bring trade under state control and make the manufacture of certain products the monopoly of the state. Finally, he created a civil service for which candidates were trained at the first European state university, in Naples, which he himself founded in 1224.

Years as a crusader. In the meantime, the Pope was reminding the Emperor of the crusading vows he had taken at his coronations in 1212 and 1220. Frederick, however, was inclined to postpone such a venture until the Italian problems had been resolved. He claimed the Kingdom of Jerusalem for himself through his marriage to Isabella (Yolande) of Brienne, the heiress of the titular king of Jerusalem, who had become his wife in 1225 after Constance had died in 1222. Before embarking for the Holy Land, Frederick convened an imperial diet for Easter 1226 in Cremona, in northern Italy, in order to reinforce certain imperial rights in Italy and to prepare for the crusade. The cities of Lombardy, however, reconstituted themselves, under the leadership of Milan, as the Lombard League, and not only sabotaged the diet at Cremona but effectively opposed Frederick's reorganization of northern Italy.

In September 1227, when Frederick was at last ready to embark from Brindisi for the Holy Land, an epidemic broke out among the crusaders. The new pope, Gregory IX, a passionate man who belonged to the intellectual world of Francis of Assisi—his personal friend whom he canonized as early as 1228—brushed aside Frederick's justification and excommunicated him for his failure to carry out the crusade.

In June 1228, ignoring the excommunication, Frederick set sail from Brindisi. In the Holy Land, following complex negotiations, he obtained Jerusalem, Bethlehem, and Nazareth from the Sultan al-Kāmil of Egypt. It was certainly the impact of Frederick's personality on the Arab world, and not armed might, that made this treaty possible. On March 18, 1229, the excommunicated emperor crowned himself king of Jerusalem in the Church of the Holy Sepulchre. This was the high point as well as the turning point of Frederick's conception of sovereignty. Eschatological prophecies concerning his rule were now made, and the Emperor considered himself to be a messiah, a new David. His entry into Jerusalem was compared with that of Christ on Palm Sunday, and, indeed, in a manifesto the Emperor, too, compared himself to Christ.

In the meantime, however, papal troops had penetrated into the Kingdom of Sicily. Frederick returned at once and reconquered the lost areas but did not in turn attack the Papal States. His diplomacy was rewarded: after the Treaty of San Germano (July 1230) he was absolved from excommunication the following month at Ceprano.

In August 1231, at Melfi, the Emperor issued his new constitutions for the Kingdom of Sicily. Not since the reign of the Byzantine emperor Justinian in the 6th century had the administrative law of a European state been codified. Frederick's codes contained many ideas that anticipated enlightened absolutism and the centralization of the state. During the same time, however, Frederick could not prevent his son, the German king Henry VII, from making a number of important concessions to the German princes. These concessions, confirmed by Frederick in 1232 at the diet of Cividale, strengthened the rule of the princes at the expense of the central power of the empire. These and other steps set back the development of communal self-government in Germany and furthered the independence of the principalities. In the meantime, relations between Frederick and Henry VII deteriorated steadily. Henry had been ruling independently

in Germany since 1228, when in December 1234 he entered into an alliance with the Lombard League. This action amounted to high treason in the eyes of the Emperor. On Frederick's arrival in Germany, his son's rebellion collapsed; he died in a prison in Calabria in 1242.

His second wife having died in 1228, Frederick in July 1235 married Isabella of England. Shortly thereafter, he issued an edict of imperial peace, which also called for the appointment of a chief justice of the imperial court in order to protect the sovereign rights of the emperor from further erosion.

After some military successes in Lombardy against the Lombard League, the Emperor returned to Germany in 1236 to remove the rebellious duke Frederick of Austria and Styria from rule. In February 1237 he had his nine-year-old son Conrad IV elected king of Germany in Vienna. After several more months in Germany—it was to be his last visit—he descended into northern Italy. He defeated the Lombard League at Cortenuova, but, misjudging his strength, he rejected all Milanese peace overtures and insisted on unconditional surrender. It was a moment of grave historic importance when Frederick's hatred coloured his judgment and blocked all possibilities of a peaceful settlement.

Struggle with the papacy. Milan and five other cities held out, and in October 1238 he had to raise the siege of Brescia. In the same year the marriage of Frederick's natural son Enzo with the Sardinian princess Adalasia and the designation of Enzo as king of Sardinia, in which the papacy claimed suzerainty, led to the final break with the Pope. Gregory IX deeply distrusted Frederick both in religious and political matters: Frederick was supposed to have jested that Moses, Christ, and Muhammad were three impostors who had themselves been hoodwinked; and in the political arena the Pope was fearful that the Papal States were about to be isolated and encircled, particularly because a pro-imperial party had been formed in Rome. Under the pretext that the Emperor intended to drive him from Rome, Gregory excommunicated Frederick for the second time on Palm Sunday, March 20, 1239. This was the beginning of the last phase of the gigantic struggle between the papacy and the empire; it ended with the death of the Emperor and the downfall of his house.

Frederick countered the excommunication with a number of important manifestos, most of them composed by Pietro della Vigna, a member of the imperial chancery, who had outstanding literary gifts. The manifesto emphasized that the cardinals were meant to participate in the leadership of the church, and Frederick even tried to evoke solidarity among the secular princes. He also, however, intensified his military activities in northern Italy. In order to finance his constantly growing need for arms, he instituted a thorough administrative reorganization of imperial Italy (among others, the formation of 10 vice regencies) and of the Kingdom of Sicily. In addition, he decreed the rigorous surveillance of the population. In central Italy he took the offensive, occupying the March of Ancona and the Duchy of Spoleto, and in February 1240 his army marched into the Papal States and threatened Rome. At the last moment, however, the Pope won the support of the Romans.

Following the defeat of a Genoese fleet bringing delegates for a papal council to Rome, more than 100 high-ranking ecclesiastics—cardinals and bishops among them—were taken as Frederick's prisoners to Apulia. This military victory proved, however, to be a political disadvantage: it provided material for propaganda depicting Frederick as an oppressor of the church.

While still encamped before Rome, Freder-

ick received the news of Pope Gregory's death and thereupon withdrew to Sicily. In the meantime, the Mongols had invaded Europe. They were temporarily halted in the extremely bloody Battle of Liegnitz in Silesia on April 9, 1241, but probably only the sudden death of their leader, the great khan Ögödei, prevented further Mongol advances at that time.

Celestine IV's brief pontificate was followed by a long interregnum. When in 1243 Innocent IV was elected, Frederick, at the urging of the German princes and of King Louis IX of France, opened negotiations with the new pope. Agreement between the Pope and the Emperor seemed close on the evacuation of the Papal States, when in June 1244 Innocent fled the city. In Lyon he convened a council for 1245 and in July of that year deposed the Emperor, the obstacle to reconciliation apparently being the status of the Lombard communes.

The battle between the Emperor and the papacy then raged in full fury; on the papal side the Emperor was branded as the precursor of the anti-Christ; on the imperial side he was hailed as a messiah. The Emperor supported the contemporary demand that the church return to the poverty and saintliness of the early Christian community and again appealed to the princes of Europe to join in a defensive league against the power-hungry prelates. Most of the princes, however, remained neutral, and, although two successive German antikings received little support, the Emperor steadily lost ground in Germany.

In May 1247 Frederick's planned journey to Lyon in order to plead his own case before the papal council was interrupted by the revolt of the strategically placed city of Parma. In the wake of this debacle much of central Italy and the Romagna was lost. The following year the Emperor was to suffer further blows of fate; Pietro della Vigna, for many years the Emperor's confidant, was accused of treason and committed suicide in prison. In May 1249 King Enzo of Sardinia, Frederick's favourite son, was captured by the Bolognese and was kept incarcerated until his death in 1272.

The Emperor's position, both in Italy and—in Germany, was improving when he died unexpectedly in 1250. He was buried in the cathedral of Palermo near his first wife, his parents, and his Norman grandfather.

When the news of his death was published, all Europe was deeply shaken. Doubts arose that he was really dead; false Fredericks appeared everywhere; in Sicily a legend grew that he had been conveyed to the Aetna volcano; in Germany that he was encapsuled in a mountain and would return as the latter-day emperor to punish the worldly church and peacefully reestablish the Holy Roman Empire. Yet he was also thought to live on in his heirs. In fact, however, within 22 years after his death, all of them were dead: victims of the battle with the papacy that their father had begun.

Assessment. Frederick's character was marked by sharp contradictions, undoubtedly the result of his insecure and emotionally barren childhood. Enchanting amiability and gaiety were paired with cruelty; harshness and rigidity existed side by side with superior intelligence and a keen sense of reality; tolerance and intolerance went hand in hand; impulsive sensuality did not stand in the way of genuine piety; imbalance and inner discord pervaded his personality and his achievements.

Frederick cannot be considered the first modern man on the throne, nor a pioneer of the Renaissance, as some historians have maintained. Though his gifted personality heralded some of the intellectual trends of later times, he was, all in all, a man of the Middle

Agas. He had indeed had the good fortune to have grown up in Sicily in a mixed culture that uniquely combined elements of antiquity, Arabic and Jewish wisdom, the Occidental spirit of the Middle Ages, and Norman realism. The intellectual life of his court reflected this heritage. A courtly "republic of scholars," it nurtured and fostered the natural sciences as well as philosophy, poetry, and mathematics, and translations as well as original writing, both in Latin and in the vernacular. The pursuit of knowledge without special respect for traditional authorities was characteristic of Frederick and his court.

Witness to the intellectual vigour and distinction of Frederick himself and those around him are the content and style of his great legal codices and manifestos, many of them serving as examples to later generations; the edifices he erected, particularly the classic style of the Castello del Monte—a fusion of poetry and mathematics in stone; and, most outstanding, his own work *De arte venandi cum avibus*, a standard work on falconry based entirely on his own experimental research.

Frederick's concept of the emperor's function was rooted in the ideology of the late Greco-Roman period and the Judeo-Christian philosophy of the Middle Ages, emphasizing the sacredness and universal character of the office. In the light of it, Frederick claimed pre-eminence for the emperor over all other secular rulers—undoubtedly an ill-timed claim in an age when separate nation-states were developing. Thus, Frederick's policies, full of intellectual and political promise, were in actuality dogged by tragedy. (Gu.W.)

• **Frederick (III)**, byname **FREDERICK THE FAIR**, German **FRIEDRICH DER SCHÖNE** (b. c. 1286—d. Jan. 13, 1330, Gutenstein, Austria), German king from 1314 to 1326, also duke of Austria (as Frederick III) from 1308, the second son of the German king Albert I.

After his father's murder (1308) Frederick became the head of the House of Habsburg and duke of Austria but did not succeed him as king, the count of Luxembourg being elected instead, as Henry VII. Frederick and his brothers made a treaty with Henry at Speyer in 1309, whereby they renounced the Habsburg claim to Bohemia in return for a sum of 50,000 Marks. Frederick's quarrel with his cousin Louis IV of Upper Bavaria concerning the wardship of Henry III of Lower Bavaria ended with Frederick's defeat at Gammelsdorf on Nov. 9, 1313.

Henry VII's death (August 1313) led to a double election. Four electors chose Frederick as German king at Sachsenhausen, near Frankfurt, on Oct. 19, 1314, and he was crowned by the correct archbishop, namely the archbishop of Cologne, but at the wrong place, Bonn (instead of Aachen), on November 25. On the other hand, five electors chose Louis of Bavaria outside Frankfurt on October 20, and Louis was crowned at the correct place but by the wrong archbishop (Mainz) on November 25 likewise. The resultant war between the two rivals lasted nearly eight years. Finally, Frederick was decisively defeated by Louis on Sept. 28, 1322, at Mühldorf in Bavaria and was imprisoned in the castle of Trausnitz (Upper Palatinate). In March 1325 he was freed after taking an oath to recognize

Louis as king and to see to it that his brother Leopold did so too. When he proved unable to do so he returned voluntarily to prison, though the Pope had freed him from his oath. In September 1325 Louis accepted Frederick as co-ruler, but after Leopold's death (February 1326) Frederick's power was confined to Austria.

• **Frederick III** (b. Sept. 21, 1415, Innsbruck, Austria—d. Aug. 19, 1493, Linz), Holy Roman emperor from 1452 and German king from 1440 who laid the foundations for the greatness of the House of Habsburg in European affairs.

Frederick III, engraving by Pieter Van Sompel, 1644, from a drawing by Pieter Soutman

By courtesy of the Bild Archiv, Österreichische Nationalbibliothek, Vienna

Frederick, the son of Duke Ernest of Austria, inherited the Habsburg possessions of Inner Austria (Styria, Carinthia, Carniola, and Gorizia) on his father's death in 1424. By 1439 he had become the senior member of the dynasty and the following year was elected German king; yet he was to be plagued by conflicts with his relatives and a powerful, rebellious nobility throughout his reign. As guardian of Ladislav Posthumus, son of his cousin the German king Albert II, Frederick attempted to exploit his ward's claims to the Bohemian and Hungarian thrones to his own advantage; but rebellious nobles forced him to release Ladislav prematurely (1452). On the boy's death in 1457, the House of Habsburg temporarily lost possession of both domains; Bohemia elected George of Poděbrady and Hungary elected Matthias I Corvinus as kings.

Revolts of the Austrian nobility, disputes with the German princes, and inability to carry out governmental reforms caused Frederick to withdraw almost completely from German affairs. This heightened German dissatisfaction and resulted in the rise of a number of claimants to the throne, including Frederick's own brother Albert VI. With Albert's death in 1463, however, and the cession of Tirol by Frederick's cousin Sigismund to Frederick's son Maximilian, the Austrian heritage, partitioned between two rival branches of the House of Habsburg in 1379, was once again united.

Frederick maintained somewhat better relations with the church. Travelling to Italy, he received the Lombard crown (1452) and, on March 19, 1452, became the last emperor to be crowned in Rome by a pope.

Frederick was never able to pacify the eastern borders of his realm. The Ottomans took Constantinople in 1453 and advanced into Styria and Carinthia, unopposed by the financially and militarily weak emperor. It was from his reign onward, however, that the Habsburgs saw themselves as Christian Europe's first line of defense against Islām, a role they were to play for more than three centuries. Frederick had to suffer the humiliation of seeing Matthias I Corvinus of Hungary conquer much of Austria and enter Vienna

in 1485, but Matthias' death in 1490 allowed Frederick's son Maximilian to recapture Austria (1490–91).

Frederick's greatest achievement was marrying his son in 1477 to Mary, daughter of Charles the Bold, duke of Burgundy, a union that gave the House of Habsburg a large part of the Burgundian domains and made the Austrians a European power.

After 1486, when, on the insistence of the German princes, Maximilian became king of the Romans and co-regent, the Emperor assumed a less active role in affairs of state.

Like many men in the late Middle Ages, he occupied his time with astrology, magic, and the attempted manufacture of gold from base metals; but he also travelled as far as the Holy Land (1437), associated with Humanists, and collected books and precious stones.

PALATINATE

• **Frederick III**, byname **FREDERICK THE PI- OUS**, German **FRIEDRICH DER FROMME** (b. Feb. 14, 1515, Simmern, Ger.—d. Oct. 26, 1576, Heidelberg, Rhenish Palatinate), elector Palatine of the Rhine (1559–76) and a leader of the German Protestant princes who worked for a Protestant victory in Germany, France, and the Netherlands.

Frederick III the Pious, detail of a portrait by an unknown artist, c. 1576; in the Historisches Museum der Pfalz, Speyer, Ger.

By courtesy of the Historisches Museum der Pfalz, Speyer, Ger.

Frederick adopted Lutheranism in 1546 and Calvinism somewhat later. His Calvinism and his opposition to the Habsburg emperors made his electoral position insecure, because the Peace of Augsburg (1555) covered relations only between Catholics and Lutherans, and the German Protestant princes were unwilling to venture an attack on the emperor. Frustrated in Germany, Frederick sent his sons to aid foreign Protestants, John Casimir to the French Huguenots and Christopher to Holland. By the time Frederick died, the Palatinate had become the centre of German Calvinism.

• **Frederick IV**, byname **FREDERICK THE RIGHTEOUS**, German **FRIEDRICH DER AUFRICHTIGE** (b. March 5, 1574, Amberg, Palatinate—d. Sept. 19, 1610, Heidelberg), elector Palatine of the Rhine, only surviving son of the elector Louis VI.

Frederick's father died in October 1583, when the young elector came under the guardianship of his uncle John Casimir, an ardent Calvinist. In January 1592, on the death of John Casimir, Frederick undertook the government of the Palatinate and continued his uncle's policies of hostility to the Catholic Church and the Habsburgs and cooperation with foreign Protestants. He was often in communication with Henry of Navarre, afterward Henry IV of France, and like him was unremitting in his efforts to conclude a league

among the German Protestants. After many delays the Union of Evangelical Estates was actually formed in May 1608, under the leadership of the elector, and he took a prominent part in directing the operations of the union until his death. Frederick was very extravagant, and liked to surround himself with pomp and luxury.

• **Frederick V** (b. Aug. 26, 1596, Amberg, Upper Palatinate—d. Nov. 29, 1632, Mainz, Ger.), elector Palatine of the Rhine, king of Bohemia (as Frederick I, 1619–20), and head of the Protestant union against Catholic Austria at the beginning of the Thirty Years' War.

After receiving a French education, Frederick succeeded his father, the elector Frederick IV, in 1610. When the Protestant Bohemian estates revolted against the Catholic emperor Ferdinand II and offered the crown to the young elector, he accepted and was crowned

Frederick I, engraving, 1701

Archiv für Kunst und Geschichte, Berlin

sent to the Netherlands (1688) to protect William of Orange's continental lands against expected French attacks when William crossed the Channel to accept the English crown. By this act Frederick hoped to gain the Dutch stadholdership for himself or his descendants, but he was eventually frustrated. Although, in the wars of the Grand Alliance against Louis XIV (1689–97), Prussia's contingents in the imperial army distinguished themselves everywhere, Prussia emerged practically unwarded at the Treaty of Rijswijk (1697). On Nov. 16, 1700, however, Austria and Prussia signed a secret treaty that permitted Frederick to crown himself king in Prussia, thus finally realizing his long-cherished ambition. Austria agreed to this elevation primarily to gain Prussian aid in the threatening war against France over the succession to the Spanish throne. In return, Frederick promised to send 8,000 troops beyond the normal Prussian contingent to the imperial army, to give preference to Habsburg candidates in imperial elections, and to vote with Austria on all important matters in the German Diet as far as Prussian interests permitted. Thus, when Frederick crowned himself in Königsberg on Jan. 18, 1701, Prussia was saddled with weighty obligations. Only his son, Frederick William I, and his grandson, Frederick II the Great, were able to exploit Prussia's enhanced position to the full and transform the new kingdom into a great European power.

During the War of the Spanish Succession (1701–14), Frederick remained a loyal ally to Austria, and Prussia's military contribution proved outstanding; but again, at the Treaty of Utrecht (1713), Frederick's territorial rewards were small, consisting of the Swiss canton of Neuchâtel and a few enclaves on the lower Rhine.

Prussia's elevation to a monarchy gave greater cohesion to the diverse and dispersed Hohenzollern lands, which now were turned into provinces. Frederick also freed the new kingdom from imperial judicial suzerainty and increased its revenues. An influx of Dutch and French Protestants was instrumental in the creation of new industries, the reclamation of land, and the stimulation of intellectual life. The founding of the University of Halle (1694), the Academy of the Arts (1696), and the Academy of the Sciences (1700), of which the eminent philosopher Gottfried Wilhelm Leibniz became the first president, further contributed to Prussia's growing cultural importance.

• **Frederick II**, byname **FREDERICK THE GREAT**, German **FRIEDRICH DER GROSSE** (b. Jan. 24, 1712, Berlin—d. Aug. 17, 1786, Potsdam, near Berlin), king of Prussia (1740–86), a brilliant military campaigner who, in a series of diplomatic stratagems and wars against Austria and other powers, greatly enlarged Prussia's territories and made Prussia the foremost military power in Europe. An enlight-

ened absolute monarch, he favoured French language and art and built a French Rococo palace, Sans Souci, near Berlin.

A brief account of the life and works of Frederick II follows; for a full biography, see **MACROPAEDIA: Frederick the Great**.

Subjected to a Spartan regimen from infancy, Frederick tried to escape to England in 1730; when the attempt failed he submitted in terror to his father, who placed him on probation in the civil administration. Frederick acceded to the throne on his father's death (1740). As king he liberalized laws regarding censorship, religion, and torture and reinvigorated Prussian society and its institutions. Although he governed as an absolute ruler, Frederick's domestic policies reflected his view that the state exists for the welfare of the individual. He conquered Silesia (1740–45), undermining the Habsburg hold on the imperial throne in Vienna. The Seven Years' War (1756–63) confirmed his hold on Silesia and marked the beginning of Prussia's leadership of the German states. In 1785 he founded the League of Princes to defend these states against imperial incursions.

SAXONY

• **Frederick I**, byname **FREDERICK THE WARLIKE**, German **ERIEDRICH DER STREITBARE** (b. April 11, 1370—d. Jan. 4, 1428, Altenburg, Thuringia), elector of Saxony who secured the electorship for the House of Wettin, thus ensuring that dynasty's future importance in German politics.

An implacable enemy of the Bohemian followers of Jan Hus, church reformer and accused heretic, Frederick aided the Holy Roman emperor Sigismund against them from 1420 on. When the last Saxon elector of the Ascanian dynasty, Albert III, died in 1422, the emperor Sigismund, ignoring the claims of the elector Frederick I of Brandenburg, in whose hands he did not wish to see another electorate, awarded that dignity to Frederick the Warlike.

Recurrent territorial conflicts between Frederick and his relatives were resolved by the Naumburg treaty, which made Wettin lands inalienable.

• **Frederick II**, byname **FREDERICK THE GENTLE**, OF **MILD**, German **ERIEDRICH DER SANETMÜTIGE** (b. Aug. 22, 1411, Leipzig—d. Sept. 7, 1464, Leipzig), Saxon elector (1428–64) and eldest son of Frederick the Warlike; he successfully defended his electorship against the Ascanian Saxe-Lauenburg line and instituted regular diets in his territories.

Frederick settled his disputes with the Bohemian followers of Jan Hus, church reformer and condemned heretic, in 1432, and relations were cemented in 1464, when his son Albert married the daughter of the Bohemian leader George of Poděbrady. The burgrave of Meissen, acquired in 1439, added considerable land and income. From 1446 to 1451 Frederick fought the *Bruderkrieg* (Brothers' War) against his brother William over territorial claims.

• **Frederick III**, byname **FREDERICK THE WISE**, German **FRIEDRICH DER WEISE** (b. Jan. 17, 1463, Torgau, Saxony—d. May 5, 1525, Lochau, near Torgau), elector of Saxony who worked for constitutional reform of the Holy Roman Empire and protected Martin Luther after Luther was placed under the imperial ban in 1521.

Successing his father, the elector Ernest, in 1486, Frederick allied himself with Berthold, archbishop of Henneberg, to promote imperial reforms that would increase the power of

Frederick V, detail of a portrait by an unknown artist, c. 1620, in the Historisches Museum der Pfalz, Speyer, Ger.

in Prague in November 1619. Abandoned by his allies, however, Frederick was routed in the Battle of the White Mountain, near Prague (Nov. 8, 1620), by the armies of the Catholic League under Johann Tserclaes, Graf von Tilly.

Two armies, raised by Ernst von Mansfeld and Christian of Brunswick in 1621, fought for Frederick's cause in western Germany, but they were defeated within two years. Spanish and Bavarian troops occupied the Palatinate, Frederick's electoral dignities were transferred to Maximilian I of Bavaria (1623), and in 1628 Bavaria annexed the Upper Palatinate. As more Protestant princes entered the widening conflict, one of their aims was the restoration of Frederick, but this was never accomplished. He fled to The Hague in 1622 and for the rest of his life lived on money supplied by the Dutch and English. When Sweden joined the anti-Habsburg coalition, Frederick followed Gustavus II Adolphus in his march across Germany (1630–32), but he died before he was able to reclaim his throne.

PRUSSIA

• **Frederick I** (b. July 11, 1657, Königsberg, Prussia—d. Feb. 25, 1713, Berlin), elector of Brandenburg (as Frederick III), who became the first king in Prussia (1701–13), freed his domains from imperial suzerainty, and continued the policy of territorial aggrandizement begun by his father, Frederick William, the Great Elector.

In 1688 Frederick succeeded to the electorate and at once set out, assisted by the capable Eberhard von Danckelmann, his boyhood tutor, now prime minister, on the course that was to yield him a monarch's crown 13 years later. Frederick maintained a large, splendid court and an army out of proportion to his territories and position to further his pretensions.

In European politics, he allied himself with Austria and the sea powers (England and Holland) against France. Prussian troops were

the nobles at the expense of the Holy Roman emperor. In 1500 he became president of the Reichsregiment (Imperial Governing Council), which, however, because of lack of funds was soon disbanded. He was instrumental in securing the election of the emperor Charles V in 1519 after refusing the crown himself.

Frederick appointed Luther and his colleague Philipp Melancthon to the University of Wittenberg and refused to carry out a papal bull against Luther in 1520. After the ban was imposed on Luther the next year, Frederick welcomed him to the Wartburg, where Luther translated the Bible into German.

A patron of the artists Albrecht Dürer and Lucas Cranach the Elder and a friend of the Humanist Georg Spalatin, Frederick also collected a large number of religious relics and founded the University of Wittenberg in 1502. Never having married, he died without legitimate heirs.

SICILY

• **Frederick I:** *see* Frederick I (Germany/Holy Roman Empire).

• **Frederick II (or I):** *see* Frederick II (Germany/Holy Roman Empire).

• **Frederick III (or II)** (b. 1272—d. June 25, 1337, Paterno, Sicily), king of Sicily from 1296, who strengthened the Aragonese interest there against the Angevins of Naples.

Appointed regent of Sicily by his brother, James II of Aragon, in 1291, Frederick was elected king by the Sicilian parliament (Dec. 11, 1295), to prevent the island's return to the rule of the Angevin Charles II of Naples; he was crowned on March 25, 1296. To revive the Ghibelline tradition of the Holy Roman emperors Frederick I and II, he called himself Frederick III, though he was in fact only the second Frederick to reign in Sicily. A war with Naples and the papacy followed. By the Peace of Caltabellotta (Aug. 31, 1302), it was agreed that Frederick should retain Sicily with the title of "king of Trinacria" until his death, when the island would revert to the Angevins.

When hostilities broke out again in 1310, Frederick reassumed the title "king of Sicily" and had his son Peter designated as his successor, thus ensuring the continuance of Aragonese rule in Sicily.

during the 18th-century Age of Freedom, a period of parliamentary government.

Frederick was the eldest surviving son of the landgrave of Hesse-Kassel. He fought bravely for England during the War of the Spanish Succession (1701–14). His marriage in 1700 to Louise of Prussia ended with her death in 1705, and in 1715 he married Ulrika Eleonora, sister of Charles XII of Sweden, after first proposing in 1708. She succeeded to the Swedish throne at the death of Charles XII in 1718, but, devoted to Frederick, she abdicated in his favour in 1720, and he was elected king as Frederick I with the aid of anti-absolutist parliamentary forces that had earlier been instrumental in the election of Ulrika, who then inaugurated the Age of Freedom.

During his 31-year reign, Frederick I was virtually powerless, devoting his time to hunting and love affairs. He had several children by his mistress Hedvig Taube, his marriage with Ulrika being childless.

Frederick, city, seat (1748) of Frederick county, north central Maryland, U.S., on a tributary of the Monocacy River, 45 mi (72 km) west of Baltimore. Settled in 1733 and laid out in 1745 as Frederick Town, it was supposedly named for Lord Baltimore's son, Frederick Calvert. The British Stamp Act received its first repudiation from jurists in the

Syd Greenberg—Photo Researchers/EB Inc

County Court House (Nov. 23, 1765). During the Revolution, Frederick sent two companies of minutemen to Boston and supplied 1,700 men to support George Washington at Valley Forge.

Although victorious at the Battle of Monocacy (July 9, 1864), fought to the south at Frederick Junction, Confederate forces were delayed long enough for Union reinforcements to reach the city of Washington. Following the battle, Confederate Gen. Jubal Early levied a \$200,000 ransom on the city to avoid its destruction; the last bond on this debt was not redeemed until Oct. 1, 1951.

The city is an agricultural trading and small manufacturing centre nationally known for its lime-cement products and brushes. Fort Detrick U.S. Army Research Laboratory (1943) is also an important economic factor. Institutions include Hood College (1893), Frederick Community College (1957), and the Maryland School for the Deaf (1867).

Francis Scott Key, author of "The Star Spangled Banner," was born nearby and was buried in Mt. Olivet Cemetery. Chief Justice Roger Brooke Taney, who delivered the Dred Scott Case decision (1857) that made slavery legal in the territories, lived in Frederick, and his house (1799) contains Taney and Scott Key

mementos. Barbara Fritchie's reputed taunting of "Stonewall" Jackson's "rebel hordes" marching through Frederick has been eternalized in John Greenleaf Whittier's poem "Barbara Fritchie"; her house has been reconstructed as a museum. Inc. 1833. Pop. (1990) 40,148.

Frederick Augustus, German FRIEDRICH AUGUST, name of electors and kings of Saxony, grouped below chronologically and indicated by the symbol •.

• **Frederick Augustus I** (elector): *see* Augustus II under Augustus (Poland).

• **Frederick Augustus II** (elector): *see* Augustus III under Augustus (Poland).

• **Frederick Augustus I** (b. Dec. 23, 1750, Dresden, Saxony—d. May 5, 1827, Dresden), first king of Saxony and duke of Warsaw, who became one of Napoleon's most loyal allies and lost much of his kingdom to Prussia at the Congress of Vienna.

Succeeding his father in 1763 as the elector Frederick Augustus III, he brought order and efficiency to his country's finances and administration. In foreign policy, he was neutralist but drifted toward Prussia, whose side he took in the Bavarian succession dispute (1778–79), when it prevented Bavaria's cession to Austria. For his cooperation he received substantial financial compensation from Prussia. In 1785, Frederick Augustus joined the Prussian-sponsored Fürstentum (League of Princes), but remained neutral during the Austro-Prussian dispute in 1790. Offered the Polish crown in 1791, he declined. The next year Saxony reluctantly joined the coalition against Revolutionary France but was defeated by 1796. Again entering the struggle on Prussia's side in 1806, after the decisive defeat at Jena in the same year, Frederick Augustus made peace with Napoleon, which secured the title of king of Saxony for him. A year later, Napoleon secured the grand duchy of Warsaw for him. Frederick Augustus remained a loyal ally to France even after the disastrous Russian campaign (1812–13). Although he had started half-hearted negotiations with Austria, he broke them off after the French victory at Lützen (May 1813). In the Battle of Leipzig (October 1813), however, his troops went over to Prussia and he was taken prisoner. At the Congress of Vienna in 1815, Frederick Augustus lost three-fifths of his territory to Prussia. He spent the rest of his life attempting to rehabilitate his truncated state.

• **Frederick Augustus II** (b. May 18, 1797, Dresden, Saxony—d. Aug. 9, 1854, the Tirol, Austria), reform-minded king of Saxony and nephew of Frederick Augustus I, who favoured German unification but was frightened into a reactionary policy by the revolutions of 1848–49.

Frederick Augustus II of Saxony, detail from an engraving, 1854

By courtesy of the Staatsbibliothek West Berlin

Frederick Augustus shared the regency with his uncle, King Anton, from 1830 to 1836, when he succeeded to the throne. The constitution of 1831, granting a measure of representative government, was partly his work. He continued to advocate reform after his accession but, lacking resolution, accomplished very little. Frederick Augustus sympathized with the plan for German unity espoused by the Frankfurt National Assembly in 1848, though he refused to accept that body's liberal draft constitution. This refusal led to the Dresden revolt in May 1849, which was crushed only with the aid of Prussian troops. Thereafter, F.F. von Beust, a reactionary enemy of Prussia and friend of Austria, brought Saxony wholly into the Austrian camp. After the abortive revolution, Frederick Augustus became less and less active in the government of his state. Always an enthusiastic amateur botanist, who had travelled extensively in Europe pursuing this hobby, he died as the result of an accident on one of his expeditions to the Tirol.

Frederick Charles, PRINCE OF PRUSSIA, by name **THE IRON PRINCE**, German FRIEDRICH KARL, PRINZ VON PREUSSEN, OF DER EISERNE PRINZ (b. March 20, 1828, Berlin—d. June 15, 1885, Klein Glienicke, near Potsdam, Ger.), Prussian field marshal, victor in the Battle of Königgrätz (Sadowa) on July 3, 1866.

Frederick Charles, 1875

By courtesy of the Staatsbibliothek West Berlin

The eldest son of Prince Charles of Prussia and nephew of the future German emperor William I, Frederick Charles was educated from childhood for a military career. He became a colonel in 1852 and a major general in 1854, in which year he married Princess Marie Anne of Anhalt.

In 1861 he was made a general of cavalry

and in 1864 fought capably against Denmark. At Königgrätz on the Bohemian front in the Seven Weeks' War, he commanded the Prussian 1st Army, which had the major responsibility for the decisive victory over Austria.

During the Franco-German War of 1870–71, Frederick Charles commanded the 2nd Army. In the early fighting he drove Marshal A.F. Bazaine's French forces back into Metz, and on Oct. 27, 1870, he received the capitulation of that city. He was promoted to field marshal the following day. Subsequently he captured Orléans, thoroughly disrupted the French Army of the Loire, and broke up Gen. A.E.A. Chanzy's part of that force at Le Mans.

Despite the success of the Metz operations, they were costly in German manpower and were otherwise open to criticism. The Prince's forceful character and tactlessness, moreover, resulted in friction with Gen. K.F. von Steinmetz, commander of the 1st Army. Whatever his personal shortcomings, Frederick Charles is remembered for his genuine military ability.

Frederick Henry, PRINCE OF ORANGE, COUNT OF NASSAU, Dutch FREDERIK HENDRIK, PRINS VAN ORANJE, GRAAF VAN NASSAU (b. Jan. 29, 1584, Delft, Holland—d. March 14, 1647, The Hague), the third hereditary stadholder (1625–47) of the United Provinces

Frederick Henry, detail of a painting by Gerrit van Honthorst; in the Mauritshuis, The Hague

By courtesy of the Mauritshuis, The Hague

of the Netherlands, or Dutch Republic, the youngest son of William I the Silent and successor to his half-brother Maurice, prince of Orange. Continuing the war against Spain, Frederick Henry was the first of the House of Orange to assume semimonarchical powers in foreign as well as domestic policies.

Early life. Frederick Henry was born less than half a year before the murder of his father, William the Silent, the principal leader of the Dutch struggle for independence from Spain.

As a younger son, he was destined by his mother, a daughter of the Huguenot leader Gaspard de Coligny, for a career in her native France; but his half brother, Maurice of Nassau—who had succeeded their father as stadholder—as well as the States General, insisted that Frederick Henry serve his country. He was accordingly educated at the University of Leiden and made a member of the council of state at the age of 17. He began to take part in most of Maurice's military expeditions and was sent on various foreign missions. During the politico-religious crisis of the years 1617–19, precipitated by a doctrinal conflict within the Reformed (or Calvinist) Church, Frederick Henry, like his mother, kept cautiously to the middle of the road.

Until the age of 40, Frederick Henry was reputed to be "too fond of women to tie himself permanently to one of them" but under strong pressure from Maurice, who had no legitimate offspring, and, almost at the latter's

deathbed, he married. His wife, a lady-in-waiting to the exiled queen of Bohemia, soon acquired a fair amount of political influence as well as a universal reputation for venality, but she also managed to endow The Hague in the 17th century with some semblance of Baroque court life.

Stadholder. At Maurice's death, in 1625, Frederick Henry became stadholder in five of the seven United Provinces; a sixth, Groningen, was added in 1640. Even in Friesland, the eventual succession to the office of stadholder was assigned to Frederick Henry's son, William (born 1626). Although in theory no more than the appointed "servants" of the different assemblies of the estates, provincial and general, the princes of Orange, by establishing hereditary succession to the various stadholderships, were clearly on their way to acquiring the status of sovereigns. In view of Frederick Henry's anomalous, somewhat awkward position as a minor princeling at the helm of the government of a federation of oligarchic republics, anachronistically flourishing in a world drifting toward absolutism, his ambition was normal.

As a strategist, Frederick Henry proved himself to be the foremost disciple of his brother, Maurice, and the Dutch was against the Spanish continued to be considered a kind of military academy for young European noblemen. The Prince's universally recognized strength lay in capturing fortified "places"; once he was even heard to exclaim: "God deliver us from pitched battles," and every one of his yearly campaigns had the conquest of some important town or fortress as its aim. Hence, the borderline between the modern kingdoms of Belgium and The Netherlands came to be drawn largely according to Frederick Henry's successes and failures.

By far the most spectacular of these sieges was that of Hertogenbosch, but if the capitulation of this city marked Frederick Henry's proudest moment, it also demonstrated the inherent weakness of his position. Although his contemporaries present the prince as little short of omnipotent in the Dutch Republic, his power was based on the delicate balancing of various elements. To counterbalance the oligarchy in Holland, which contributed more than 58 percent to the federal budget, the prince needed the support of the six minor members of the United Provinces and that of the Puritan masses of the country, including those in Holland.

Although not irreligious, Frederick Henry was, like his father, a champion of as far-reaching a religious tolerance as circumstances allowed. In this respect he displayed, paradoxically, a much closer affinity with his political opponents, the Holland oligarchy, than he did with his traditional supporters. Yet as far as policymaking was concerned, this affinity was of little avail; for the Hollanders remained stubbornly opposed to a costly war, which, moreover, if waged too successfully, threatened to reintegrate the port of Antwerp as a formidable rival for Amsterdam into the political body of the free Netherlands. To make his yearly campaigns politically acceptable absorbed almost more of Frederick Henry's energies than the campaigns themselves. Clever tactician that he was, he managed, however, unlike his brother, Maurice, before and his son, William II, after him, to avoid an open conflict with the assembly of Holland.

Until about 1640, Frederick Henry alone was responsible for the United Provinces' foreign policy. From the dynastic point of view, his activities were crowned by the marriage in 1641 between his heir, William II, and Mary, the eldest daughter of Charles I of Great Britain. Consequently, during the English Civil War, the stadholder sided unconditionally with the

King, whereas the Holland oligarchy favoured Parliament.

French alliance. More important was Frederick Henry's French policy, culminating (1635) in the so-called treaty of partition between the two countries and stipulating a partitioning of the southern Netherlands, first conquered by arms from the Spanish. The treaty further provided for the yearly payment of a considerable French subsidy, thus enabling the prince to continue the war in spite of the reluctance of the war-tired assembly of Holland to finance it. But the very first campaign of the French and Dutch armies combined under Frederick Henry's command nearly ended in disaster, and, in spite of his conquests of the cities of Breda and Hulst, the alliance never regained its momentum. The trend toward peace with Spain became more and more irresistible, and, largely through the influence of his wife, even Frederick Henry was eventually won over to the peace party. Prematurely aged after long years of suffering from gout, he did not live to see the peace officially concluded in January 1648. He died in March 1647 and was interred with great pomp in the family vault at Delft.

Frederick Louis, PRINCE OF WALES, German FRIEDRICH LUDWIG (b. Jan. 6, 1707, Hannover, Hanover—d. March 20, 1751, London), eldest son of King George II of Great Britain (reigned 1727-60) and father of King George III (reigned 1760-1820); his bitter quarrel with his father helped bring about the downfall of the King's prime minister, Sir Robert Walpole, in 1742.

After his grandfather became king of Great Britain as George I in 1714, Frederick was betrothed to Wilhelmina Sophia Dorothea, daughter of Frederick William I, king of Prussia, but the match was prevented by the ill will between the parents. On the accession of George II (1727) Frederick returned to England, was created duke of Cornwall, and in 1729 became prince of Wales.

The relations between father and son deteriorated rapidly, the chief bone of contention being the King's refusal to make Frederick an adequate allowance. In 1735 the Prince wrote or inspired the *Histoire du Prince Titi*, which

Frederick Louis, detail of a portrait by Philip Mercier, c. 1736-38; in the National Portrait Gallery, London

contained offensive caricatures of both the King and Queen. After Frederick married Augusta, daughter of Frederick II, duke of Saxe-Gotha, in April 1736, George II proposed to give his son an allowance of £50,000 a year, but this Frederick considered inadequate. The breach became irreparable when Frederick allowed his opposition friends to raise the matter, unsuccessfully, in Parliament (1737). He went to the length of refusing to allow his first child to be born under the parental roof, carrying off his wife, almost in labour, from Hampton Court.

After this insult, Frederick was banned from the court, and foreign ambassadors were told not to visit him. His new home, Leicester House, became a centre for political opposition. Frederick hated Sir Robert Walpole in particular; after Walpole's downfall he was formally reconciled with his father but continued until his death to intrigue against all George's ministers. In 1745 George refused to allow him to command the army against the Jacobites.

Frederick having died in 1751, his eldest son, George, succeeded to the throne as George III in 1760.

BRANDENBURG

● **Frederick William, byname THE GREAT ELECTOR**, German DER GROSSE KURFÜRST (b. Feb. 16, 1620, Kölln, near Berlin—d. May 9, 1688, Potsdam, near Berlin), elector of Brandenburg (1640-88), who restored the Hohenzollern dominions after the devastations of the Thirty Years' War—centralizing

Frederick William, the Great Elector, portrait by Adriaan Hanneman; in the castle at Dessau, Ger.

Foto Marburg—Art Resource

the political administration, reorganizing the state finances, rebuilding towns and cities, developing a strong army, and acquiring clear sovereignty over ducal Prussia. All these measures contributed to the foundation of the future Prussian monarchy.

Frederick William was the eldest son of the elector George William and Elizabeth Charlotte of the Palatinate, a granddaughter of William the Silent, prince of Orange.

He grew up amid the chaos of the Thirty Years' War, in which Brandenburg suffered particularly heavily, and was forced to spend his childhood years far from the Berlin court in the fortress of Küstrin, where he was educated in the Calvinist faith. His stay in Holland between his 14th and 18th years, the time divided between the University of Leiden and the court of his future father-in-law, Frederick Henry of Orange, at The Hague, left him with lasting impressions. The future elector was, above all, impressed by Holland's imposing maritime and commercial power, as well as by its pioneering achievements in military technology and organization. He retained a marked preference for Dutch architecture and agriculture and a strong desire to open

Brandenburg to international commerce and maritime trade.

Early years of reconstruction. When Frederick William, completely inexperienced in politics, succeeded his father as elector in December 1640, he took over a ravaged land occupied by foreign troops. Under his father's powerful favourite, Graf Adam von Schwarzenberg, Brandenburg had changed sides from the Swedes to the Habsburgs and had thus been drawn into the struggle on both sides. Residing until 1643 not in Brandenburg, the heartland of his domain, but rather in Königsberg (now Kaliningrad, Russia), the capital of the remote Duchy of Prussia, the Elector at first pursued a policy of cautious neutrality in order to escape the pressure of the rival powers. He discharged the Brandenburg troops in the service of the Habsburg emperor and concluded an armistice with Sweden.

He soon recognized, however, that without an army he could never become master in his own house. In 1644, at the beginning of negotiations to conclude the Thirty Years' War, he had already started to organize his own military force. Though his army was small, Brandenburg could not support it without requisitioning funds from the Duchy of Cleves, in the west, and from the Duchy of Prussia. For the first time Brandenburg's territories, united only by their allegiance to the person of the Elector, were drawn together for a political purpose. The standing army was the first institution used by the increasingly absolutist rulers of Brandenburg to combat the privileges of the estates of the individual territories. It was never entirely disbanded and became the core of the 18th-century Prussian army.

This army was not big enough to allow Frederick William to conduct an independent foreign policy. Moreover, his marriage in 1646 to Louise Henriette of Orange failed to bring the anticipated Dutch support. Lacking the support of friendly great powers at the peace congress of Westphalia in 1648, he did not attain his aim of acquiring all of Pomerania, with the Oder estuary and the important harbour of Stettin (since 1945 Szczecin). He had to be content with eastern Pomerania, the secularized dioceses of Minden and Halberstadt, and the promise of the archbishopric of Magdeburg, all of which were, however, important as links to his western German possessions.

After seven years of peaceful reconstruction, Frederick William saw his political and military ability put to a difficult test with the outbreak of the First Northern War (1655-60). By invading Poland, King Charles X Gustav of Sweden sought to expand the power in the Baltic that Sweden gained by the Peace of Westphalia. Frederick William, as duke of Prussia, owed fealty to the Polish king, but, when offered an alliance by Sweden in return for control over the East Prussian ports, the Elector chose armed neutrality. When Charles Gustav rapidly overran Poland and advanced against East Prussia, Frederick William had to exchange Polish for Swedish suzerainty and provide armed support to Charles Gustav. In the three-day Battle of Warsaw in July 1656, the untried army of Brandenburg, under the Elector's command, passed its test of fire. To keep the Elector on his side, the Swedish king granted him full sovereignty over the Duchy of Prussia. This did not prevent Frederick William, when Sweden's military position deteriorated, from entering into negotiations with Poland, which now renounced suzerainty over East Prussia. With his new allies, Poland and the Habsburg emperor, the Elector drove the Swedes from western Pomerania. French intervention, however, forced Frederick William once again to give up his Pomeranian conquests. Ratified in the Treaty of Oliva in 1660, this renunciation was balanced by confirmation of the Elector's full sovereignty over the Duchy of Prussia.

The Elector's ability to gain his ends arose not only from the ease with which he changed sides but also from his success in forcing the provincial estates to support the standing army independently of tax appropriations by the diets. In the second half of his reign, he removed control of taxation and finances from the estates altogether, thereby laying the groundwork for the powerful bureaucracy of later Prussian absolutism, with its standing army, fixed taxes, and an officialdom dependent on the sovereign alone.

Attempts to establish balance of power. The year 1661, in which Louis XIV assumed the reins of government in France, ushered in an era of vast power struggles in Europe. In the conflict erupting between Austria and Spain, on the one side, and France and Sweden, on the other, the Elector hoped to maintain the balance of power by preventing either side from achieving predominance. He sought not a simple policy of neutrality but rather, as he recommended to his successor in his political testament of 1667, to advance the interests of his house by always joining the weaker power against the stronger. Here lies the basis for the continual shifts in his policy of alliances: "Brandenburg's intermittent fever," which became proverbial in the 17th century.

In 1672, when Louis XIV prepared for the invasion of Holland, Frederick William, still true to his policy of supporting the weaker power, allied himself with the Dutch states-general. Their sole European ally, he concluded an aid agreement with them, fully aware of the danger from France to his territories of Cleves on the lower Rhine. But after the unexpectedly rapid collapse of the Netherlands forced him to make a separate peace with France in 1673, the Elector adopted a policy of neutrality, which he abandoned only when the Holy Roman Empire declared war against France. In July 1674 he joined the alliance of the Habsburg emperor, Spain, and the Netherlands. Frederick William's military expectations were disappointed by the slow progress of the allies on the upper Rhine. He also suffered a more serious personal loss with the death of the gifted young heir to the throne, Karl Emil.

When the Swedes invaded Brandenburg, the Elector turned northward, and under his command his army, in June 1675, scored its first independent victory. In a contemporary folk song Frederick William was for the first time called the "Great Elector." In the same year, allied with the Emperor and with Denmark, he once more began to retrieve the spoils of the Thirty Years' War from the Swedes. For the second time he gained western Pomerania by the sword, only to lose it again under French pressure. Abandoned by his allies, he had to yield the fruits of his victory in the Peace of Saint-Germain-en-Laye in 1679.

Later policies. Frederick now decided to gain in alliance with France what he could not obtain by opposing it. In 1679 he concluded a secret pact with France, committing himself, in return for large subsidies, to support French candidates in the next elections for king of Poland and for emperor. The alliance endured as long as the Elector believed that Louis XIV would help him gain possession of western Pomerania. When he realized that this hope was vain, Frederick William changed political partners, for the last time, in 1685. The Elector's disillusionment with Louis XIV coincided with the assumption by William of Orange (later King William III of Great Britain) of his historical role as founder of the Grand Alliance, against Louis XIV. The Elector, impressed that William was a prince of Orange and his own nephew, concluded a defense pact with the Netherlands in 1685. He drew still closer to William's side with the issuance of the Edict of Potsdam on Nov. 8, 1685, in which he granted asylum to all Huguenots expelled from France by Louis XIV after the

revocation of the Edict of Nantes. Thus, at the end of his life, the Great Elector returned to the political ties of his early years. He did not live to witness the great shift in the European balance of power that his nephew was to effect through his landing in England and his succeeding the Catholic Stuart King James II. But he was aware of William's plans when he died in 1688, the year of England's Glorious Revolution.

Legacy. The Great Elector bequeathed to his son Frederick (after 1701, Frederick I, king of Prussia) a well-organized state, widely respected for its sound finances and efficient army. Frederick William had gone far toward integrating his inherited and acquired territories by establishing national institutions and central administrative bodies. He did, however, endanger the further integration by endowing the children of his second marriage, contracted in 1668 with Dorothea of Holstein-Glücksburg, with semi-autonomous principalities. Many of his ambitious plans were not realized. Just as he was unable to provide a pathway to the Baltic for his country, his attempt to establish a colony on the Guinea coast of Africa remained only an episode in Brandenburg-Prussian history. He was far more successful in the economic field. The systematic colonization of the sparsely populated country, the improvement of trade routes through canal construction, and the establishment and operation of factories after the mercantilist model were begun under Frederick William. In this area, too, the Elector established a tradition that was broadened by his 18th-century successors.

Frederick William adopted the so-called government in council form of monarchical rule, whereby the ruler exercised his power with the aid of his principal council and functioned almost as a president. He always listened to his advisers' opinions but made all important decisions himself.

The political views of all rulers of that period were rooted in religion. For the Great Elector royal power was a God-given duty, a common Christian viewpoint that was given a special character by the Elector's Calvinist beliefs, which bind the ruler, just as the least of his subjects, to prove himself visibly in his daily duties. Here lies the religious basis of Frederick William's ambition for political power and of his immense, yet restrained, energy, which is still evident today in Andreas Schlüter's famous equestrian statue of the Great Elector in Berlin. (S.Sk.)

(1939), the standard biography, now in need of revision; Ferdinand Schevill, *The Great Elector* (1947), the best account in English; Francis Ludwig Carsten, *The Origins of Prussia* (1954), deals with the social and economic problems of the Elector's reign; Gerhard Oestreich, "Friedrich Wilhelm (Grosser Kurfürst)," in *Neue Deutsche Biographie*, vol. 5 (1961), contains a very complete bibliography.

HESSE-KASSEL

• **Frederick William** (b. Aug. 20, 1802—d. Jan. 6, 1875, Prague), elector of Hesse-Kassel from 1847 after 16 years' co-regency with his father; he was noted for his reactionary stand against liberalizing trends manifested during the revolutionary events of 1848. In 1850 he re-instated an unpopular adviser, Hans Daniel Hassenpflug, who called on the German Confederation to restore by force the authority of the elector. At the end of the Seven Weeks' War (1866), in which he sided with Austria, he was deposed, and his lands were seized by the victorious Prussians.

PRUSSIA

• **Frederick William I** (b. Aug. 15, 1688, Berlin—d. May 31, 1740, Potsdam, Prussia), second Prussian king who transformed his

country from a second-rate power into the efficient and prosperous state that his son and successor, Frederick II the Great, made the dominant military power on the Continent.

The son of the elector Frederick III, later Frederick I, king of Prussia, Frederick William grew up at a glamorous court, but his own temperament was ascetic, and he disapproved of the court's dissolute atmosphere. In 1706 he was married to Sophia Dorothea, the daughter of George Louis, elector of Hanover (later George I of England). His experiences in the War of the Spanish Succession (1701-14) decisively shaped his future; he realized that the army was his vocation, and he met Prince Leopold I of Anhalt-Dessau, who became his lifelong friend and principal adviser in military matters.

Frederick William I, detail from a portrait by Antoine Pesne, c. 1733; in Sanssouci Palace, Potsdam, Ger. Foto Marburg—Art Resource/EB Inc

Frederick William was to spend the rest of his life building the Prussian Army into Europe's best fighting instrument. Realizing that Prussia's military and financial weakness made it dependent on the relations between the great powers, Frederick William resolved to make his state financially independent.

In 1713 Prussia's armed forces numbered 38,000 men, supported in large part by foreign subsidies. When Frederick William died in 1740, he left his son an army of about 83,000 out of a population of 2,200,000, a war chest of more than 8,000,000 taler, and a Prussia that had become the third military power on the Continent, after Russia and France.

The canton system of recruitment and replacement, a mild form of draft introduced in 1733, provided one-half the manpower of Frederick William's army. The rest of the soldiers were recruited from all over Europe. Frederick William also created from his fractious nobility the loyal Prussian officer corps. Prince Leopold of Anhalt-Dessau, a brutal, if efficient, drillmaster, provided the instrument wielded by these officers—the Prussian infantry, which could outmarch and outshoot all others.

The need for funds, coupled with Frederick William's genuine concern for his subjects, led to a number of sweeping reforms and innovations. A thrifty, practical Protestant, the King on his accession all but dissolved his extravagant court. Prussia's eastern territories, depopulated by the plague of 1709, were resettled and made prosperous once again. The lot of the peasantry improved. In his own domains, which eventually comprised one-third of all the land, Frederick William freed the serfs completely (1719) and abolished hereditary leases. In 1717 a yearly tax replaced the aristocracy's feudal war service. Against considerable opposition, he levied additional taxes in Prussia and Lithuania. Prussia's commercial policies were strictly mercantilist, encouraging industry and manufacture, especially the wool industry, which clothed the King's army. Con-

vinced that an efficient state could not afford illiterate subjects, Frederick William instituted compulsory primary education in 1717. In 1723 he centralized his administration under a general directory through which his ministers executed his orders. Near the end of his reign, he initiated a program of extensive legal codification. Thus, Frederick William left his heir an efficient, centralized state with sound finances and an excellent army.

Frederick William's foreign policy proved to be much less effective than his domestic programs. He acquired Swedish Pomerania by the Treaties of Stockholm (1719–20), but his lifelong ambition, the incorporation of the duchies of Jülich and Berg on the lower Rhine, remained unfulfilled. Relations with Austria and England cooled considerably and by 1739 Prussia's only ally was France.

• **Frederick William II** (b. Sept. 25, 1744, Berlin—d. Nov. 16, 1797, Berlin), king of Prussia from Aug. 17, 1786, under whom, despite his lack of exceptional military and political gifts, Prussia achieved considerable expansion.

The son of Frederick the Great's brother Augustus William, he became heir presumptive on his father's death in 1758. He was intellectually receptive and devoted to the arts, but when he succeeded Frederick the Great as king, he was unable to perpetuate his uncle's system of personal government; the direction of the Prussian state fell to a few favourites. Nevertheless Prussia grew: it acquired Ansbach and Bayreuth when the margrave Charles Alexander renounced his territories (1791), and it gained Danzig (Gdańsk), Thorn (Toruń), and a large part of central Poland (including Warsaw) in the Second (1793) and Third (1795) Partitions of that country.

In foreign affairs Frederick William cooperated with the Holy Roman emperor Leopold II and entered into an Austro-Prussian alliance (Feb. 7, 1792), chiefly because of a common opposition to the French Revolution. In the War of the First Coalition, Frederick William's preoccupation with getting his share of Poland led him to conduct the war halfheartedly, and in 1795 he withdrew from the coalition by concluding the separate Treaty of Basel. In domestic affairs the King gained easy popularity by abolishing the state monopoly on coffee and tobacco, although the loss of revenue had to be made good by increasing the excise duty on beer, flour, and sugar. Frederick William's most notorious domestic measure was the *Religionsedikt* ("Religious Edict") of 1788, largely the work of his favourite, Johann Christoph von Wöliner. It gave legal recognition to the principle of toler-

ation while restricting the freedom of religious instruction and binding the clergy to a narrow Protestantism. Although it was zealously enforced (Immanuel Kant was reprimanded and several important journals moved abroad to avoid censorship), the act proved ineffective. A notable law code (*Allgemeines Preussisches Landrecht*) including various liberal statutes, however, was promulgated (1794).

Under Frederick William cultural activities flourished, mostly in Berlin. Painting, architecture, and the theatre were encouraged, and especially music: Mozart and Beethoven visited the King and dedicated chamber music to him, and Frederick William himself played the cello.

He contracted two dynastic marriages, the first of which was dissolved. During the lifetime of both his royal consorts he also contracted two morganatic marriages. His son by the second of these wives, Sophia Juliana, Gräfin Dönhoff, was the future statesman Friedrich Wilhelm, Graf von Brandenburg.

• **Frederick William III** (b. Aug. 3, 1770, Potsdam, Prussia—d. June 7, 1840, Berlin), king of Prussia from 1797, the son of Frederick William II. Neglected by his father, he never mastered his resultant inferiority complex, but the influence of his wife, Louisa of Mecklenburg-Strelitz, whom he married in 1793, occasionally moved him outside his essentially pedestrian character.

His policy of neutrality in the Wars of the Second and Third Coalitions accelerated the decline of Prussia's prestige. Domestic reforms before the Battle of Jena foreshadowed later reforms without, however, altering the absolutist structure of the state. Until 1807 he clung to the traditional cabinet government, influenced by mediocre personages. After the military collapse of 1806–07 and the loss of all provinces west of the Elbe River, he finally realized that Prussia would have to make decisive changes. He therefore sanctioned the reforms proposed by Prussian statesmen such as Karl Stein and Karl von Hardenberg, but these amounted only to a reform of the higher bureaucracy, not of the royal prerogative. The King never lost his fear that reform might lead to "Jacobinism," and he could not tolerate outstanding men as advisers. Through the War of Liberation (1813–15) he remained remote from his people's ardour, being always subservient to the Russian emperor Alexander I and in harmony with the Austrian statesman

Klemens von Metternich. In the crisis of the Vienna Congress over the partition of Saxony, he sided with Alexander I, thus bringing Prussia to the brink of war against England, France, and Austria (January 1815). The final compromise allowed Prussia to acquire the Rhine province, Westphalia, and much of Saxony. In contrast to these territorial gains, the last 25 years of Frederick William's reign show a downward trend of Prussia's fortunes, to which his personal limitations largely contributed.

• **Frederick William IV** (b. Oct. 15, 1795, Cölln, near Berlin—d. Jan. 2, 1861, Potsdam, Prussia), king of Prussia from 1840 until 1861, whose conservative policies helped spark the Revolution of 1848. In the aftermath of the failed revolution, Frederick William followed a reactionary course. In 1857 he was incapacitated by a stroke, and his brother, the future William I, became regent (1858–61).

Foto Marburg—Art Resource/EB Inc

Early life. Frederick William was the son of the future king Frederick William III and Louisa of Mecklenburg-Strelitz. He was educated by tutors, mainly experienced civil servants. Though he was completely unsoldierlike by nature, his experiences in the German War of Liberation (1813–15) against Napoleon left lasting traces on his political and intellectual development. He became and remained a disciple of the German Romantic movement, with its nostalgia for the Middle Ages. Romanticism appealed to his extremely sensitive dilettante artistic nature. A draftsman interested in architecture and landscape gardening, he was a patron of Christian Daniel Rauch, a noted sculptor, and Karl Friedrich Schinkel, an architect and city planner. His marriage in 1823 to Elizabeth of Bavaria, a convert to Lutheranism, proved happy, although they had no children.

As crown prince, Frederick William developed romantic-conservative convictions that led him to approach even politics as a question of ideas and problems rather than as a matter of hard reality. Conservative philosophers, men of letters, and politicians were among his friends and the men he admired. Even though barely 20, he used his influence to restrict the promised constitution of 1815 to the creation of district and provincial estates, in which the landed aristocracy had an overwhelming majority. For him liberalism meant revolution; a modern constitution was "a scrap of paper" interposed as an intolerable barrier between the patriarchal, divinely justified king and his people. Though he was no absolutist and had no genuine will to domination, yet, by his romanticizing mystique and his unlimited respect for the alleged "organic growth" of the medieval estates, he stood irreconcilably opposed to the political ideas of the 19th century and to the heritage of the French Revolution. Tensions were not lessened by his genuine personal piety. As for him, cultural homogeneity outweighed political unity, but he was fundamentally opposed to the movement toward a German national state; after Prussia's occupation by Napoleon, he regarded his country's close alignment with Austria as essential. He never contested the Habsburg empire's primacy, which he saw as consecrated by history; for the king of Prussia he claimed only the military dignity of an "arch-general" of the empire.

Accession. Frederick William quickly disappointed the great hopes aroused by his accession in 1840, for he was by no means willing to fulfill the constitutional aspirations of the Liberals. In 1842 he permitted only "united committees" of the provincial estates; and in 1847, after long delay, he summoned not a popular representative assembly but the United Diet, comprising all the provincial estates, with the right to grant taxes and loans but without the right to meet at regular intervals. This unwieldy body remained his ideal, even though the narrow limits of his concessions immediately produced a conflict (the Diet's refusal of the proposed loan for the Berlin-Königsberg railway) and even though this first assembly of all Prussia powerfully increased the people's self-confidence on the eve of the Revolution of 1848.

Revolution of 1848. Despite belated attempts to organize a common resistance by the German governments, Frederick William was eventually completely overwhelmed by the revolution in March 1848, which was inspired by the revolution of the preceding month in France. He could neither prevent the street fighting in Berlin by last-minute concessions nor ride the wave; after the withdrawal of the troops to barracks, he masked his submission to the revolution by a processional ride through Berlin under the black and red and golden flag, the symbol of the united Germany, by paying homage to the bodies of the victims of the soldiery, and by his promise that "Prussia is henceforth merged in Germany." Finally he had to convene a Prussian national assembly. Under the influence of his entourage, however, he roused himself to a stubborn resistance; he appointed his uncle, the Count of Brandenburg (a son of Frederick William II's lastmorganatic marriage), prime minister; removed the assembly from Berlin and then dissolved it; and imposed a constitution the first moderately liberal draft of which was modelled on that of Belgium. These measures restored the leading role to the crown and its instruments, the army and the bureaucracy, firmly supported by the recently formed Conservative party.

When, on April 3, 1849, Frederick William refused the imperial crown offered by the national assembly in Frankfurt am Main—because as a true conservative he would accept it only from the German princes—he destroyed the constitution drafted by that assembly. Under Russian and English pressure, moreover, he had withdrawn Prussian support of the rising in the duchies of Schleswig and Holstein, aimed at overthrowing Danish rule there. Next, however, largely contravening his previous policy, he attempted to establish a German union under Prussian leadership (1849–50)—though this, as a "Little German" federation, should remain allied with a "wider" federation embracing Austria. When Austria challenged this union, the King shrank from war, preferring capitulation at the Punctation of Olmütz convention. Though Prussia had to return to the federal Diet at Frankfurt am Main, Prussian leadership of the German customs union, which excluded Austria, remained unchallenged.

In religious affairs Frederick William, in 1841, settled the "Cologne church conflict" on terms very favourable to the Roman Catholics, with whom, largely influenced by his love for the old and picturesque, he had great sympathy; he also furthered the reconstruction of Cologne cathedral. On the other hand, he actively promoted the joint Anglican-Lutheran bishopric of Jerusalem.

Final years. The final years of his reign were a period of reaction. Frederick William, rejecting the bureaucratic absolutism of his prime minister Otto von Manteuffel, worked above all for recasting the constitution of 1848 in a conservative mold. This included the disastrous introduction of three-class suf-

frage according to income in 1850 instead of universal suffrage, the retention of the monarchical character of army and bureaucracy, the reestablishment of the conservative district assemblies and the provincial diets, and the conversion (1854) of the first chamber into a house of lords entirely dominated by the predominantly aristocratic landowners. He believed this house of lords to be modelled on the English upper house, but in a political testament he implored his successors to refuse to take the oath on the Prussian constitution.

In 1857 a stroke resulted in paralysis. From this time on, with the exception of brief intervals, the King's mind was clouded, and his brother William (afterward emperor) took on the duties of government, becoming regent in 1858. Frederick William died at Sanssouci Palace in 1861. (Ha.He.)

BIBLIOGRAPHY. Although there is no definitive biography, E. Lewalter, *Friedrich Wilhelm II* (1938), in German, is still indispensable for the study of Frederick.

Frederick William, CROWN PRINCE OF PRUSSIA: see Frederick III under Frederick (German Empire).

Fredericksburg, city, in, but administratively independent of, Spotsylvania county, northeastern Virginia, U.S., at the head of navigation of the Rappahannock River. The site, settled in 1671, was laid out in 1727 and named for Prince Frederick Louis, father of King George III. It developed as a port with a busy English trade. William Paul, brother of John Paul Jones, set up the first tailor shop there. In 1732 George Washington's father, who owned Ferry Farm (where according to tradition George cut down the cherry tree) across the Rappahannock, bought three lots in the town and became one of its trustees.

Strategically situated midway between Washington and Richmond, it was a major objective of both sides during the American Civil War and changed hands seven times. A bloody engagement was fought there on Dec. 13, 1862. Before the war ended, three subsequent major battles were fought in the area—those of Chancellorsville (May 1–4, 1863); the Wilderness (May 5–7, 1864); and Spotsylvania Courthouse (May 8–21, 1864). Parts of the four battlefields, a national cemetery with graves of 15,000 Federal soldiers, and a museum are included in the Fredericksburg and Spotsylvania National Military Park (5,000 ac [2,023 ha]).

The city serves an agricultural region (dairy and beef cattle) and has light manufacturing. It is the seat of Mary Washington College (1908) and Germanna Community College (1970). Historic sites include the home and grave of Washington's mother (Mary Ball Washington), the law office of James P. Monroe (later president), the Rising Sun Tavern (c. 1760), built by Washington's brother Charles, and the apothecary shop of Hugh Mercer, Washington's friend. George Washington Birthplace National Monument is 38 mi (61 km) east, with James Monroe's birthplace close by. Inc. town, 1781; city, 1879. Pop. (1990) 19,027.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Fredericksburg, Battle of (Dec. 13, 1862), bloody engagement of the U.S. Civil War fought at Fredericksburg, Va.; its outcome—a crushing Union defeat—immeasurably strengthened the Confederate cause. Gen. A.E. Burnside, newly appointed commander of the Northern forces, planned to cross the Rappahannock River with an army of more than 120,000 troops and advance on the Southern capital at Richmond. Confederate Gen. Robert E. Lee countered by taking a strong position on high ground behind Fredericks-

burg with a force of about 78,000. The attack on December 13 proved a complete failure, and Burnside's casualties totalled more than 12,500, compared to only about 5,000 for the carefully entrenched Confederates. General Burnside was relieved of his command the following month and has been severely criticized by historians for his conduct of this battle. Once again the Union had failed in what should have been its main objective—destruction of the army of northern Virginia. Richmond seemed as far away as ever. For the South, the victory restored morale lost after Lee's retreat from Maryland following his unsuccessful Antietam campaign in September.

Fredericton, city, capital (since 1785) of New Brunswick, Canada, and seat of York County, on the Saint John River, 84 mi (135 km) from its mouth in the south central part of the province. Occupying the site of the French Ft. Nashwaak (1692) and the Acadian settlement of St. Anne's Point (1731), it was laid out by United Empire Loyalists (Tories) in 1785 and named after Frederick, son of King

George III. After 1825 it became a British garrison town, and its reconstructed military compound has been designated a federal historic site. Now primarily an administrative and educational centre, the city is the seat of the University of New Brunswick (1785; Canada's first university) and St. Thomas University (1910). The city's Anglican Christ Church Cathedral (1845–53) is a replica of the Gothic St. Mary's in Snettisham, Norfolk, Eng. A set of Audubon's bird paintings and a 1783 copy of England's Domesday Book are in the Georgian-style Provincial Legislative Building (1880), and the nearby Beaverbrook Art Gallery has notable 18th–20th century collections, including paintings by Winston Churchill. At King's Landing, 18 mi west, is a full-scale reconstruction of a Loyalist settlement. Also in or near Fredericton are the Royal Canadian Mounted Police regional headquarters, the Canadian Army's Camp Gagetown, and an agricultural research station. The city is the shopping and distributive centre for central New Brunswick; its manufactures include shoes, canoes, lumber products, and bricks.

Fredericton has a noted literary tradition: the Rev. Jonathan Odell (satirist of the American Revolutionary War) lived there, and the novelist Julia Catherine Hart (1796–1867) and the poets Sir Charles Roberts (1860–1945), Bliss Carman (1861–1929), and Francis Sherman (1871–1926) were born in or near there. The Playhouse (home of Theatre New Brunswick) presents drama and musicals year-round. Inc. 1848. Pop. (1991) 46,466.

Frederik (Danish, Dutch, Norwegian, etc., personal name): see under Frederick.

Frederik Hendrik (Dutch stadholder): *see* Frederick Henry.

Frederiksberg, independent municipality in Greater Copenhagen, northeastern Sjælland (Zealand), Denmark. It was founded in 1651 by Frederick III as a settlement for Dutch peasants brought to nearby Amager Island. Chartered in 1857, it became encircled by Copenhagen early in the 20th century. It is the site of the Copenhagen Zoo, the Royal Veterinary and Agricultural University (1856), the state broadcasting service, a commercial college, and the Military Academy in the early 18th-century Frederiksberg Slot (castle). The main industries include the Royal Porcelain Factory, the Carlsberg breweries, and cable and wireworks. Pop. (2000 est.) 90,300.

Frederiksborg, *amtskommune* (county), northeastern Sjælland (Zealand), Denmark, between the Isefjord and The Sound (Øresund). Its undulating surface of glacial sands and clays is lake strewn and well wooded, and the fertile loams support prosperous mixed farming. The *amtskommune* (area 520 sq mi [1,346 sq km]) was named after Frederiksborg Slot (castle; 1560) in Hillerød; the castle is now a national history museum. Its administrative centre is Hillerød, and its largest city is the port of Helsingør (*q.v.*). Kronborg Slot (castle) near Helsingør once controlled the northern entry into The Sound. Fredensborg Castle (built 1719–26), northeast of Hillerød, is the royal residence during the autumn. Pop. (2000 est.) 365,300.

Frederikshåb, Greenlandic PĀMIUT, or PAAMIUT, town, southwestern Greenland, on the Atlantic coast at the mouth of 30-mi-(48-km-) long Kvanefjord and south-southeast

Frederikshåb, Greenland

By courtesy of the Royal Danish Ministry of the Foreign Affairs, Copenhagen, photograph, Peter Juul

of Frederikshåbs Isblink (ice field), a navigation landmark. It was founded in 1742. Seal hunting, fishing, and sheep raising are the main occupations, and there is a weather and radio station. Pop. (2001 est.) 2,000.

Frederikshavn, city and port, Nordjylland *amtskommune* (county), northern Jutland, Denmark, on the Kattegat (strait), east of Hjørring. A fishing village in the 16th and 17th centuries, it was fortified (Fladstrand Citadel) in the late 17th century to secure the route to Norway. The name was changed to Frederikshavn when it was chartered (1818). Shipping connections with Norway and Sweden make it an important centre for overseas trade, shipbuilding, fishing and related industries, and a transit point for tourists. The powder magazine of the 17th-century citadel remains and houses a military museum. The nearby 18th-century manor house of Bangsbo, former home of statesman Johan Knudsen

(1865–1942), houses a museum. Pop. (2000 est.) city, 24,700; (1999 est.) mun., 34,900.

Frederiksted, also called WESTEND, town on the west coast of St. Croix, U.S. Virgin Islands, 17 mi (27 km) southwest of Christiansted. Historically, the town was a mercantile centre for the sugar-based economy of St. Croix because of its deep-sea port and warehouse facilities. Innovations in cargo handling, the termination of the sugar industry, and the improvement of facilities at Christiansted in the 1960s and 1970s led to the town's economic decline. The deepwater roadstead harbour is the only natural resource capable of reversing the trend; in the late 1970s the government initiated major improvements to the pier and developed tourist facilities, in order to encourage private investment. The town's Victorian architecture dates from its reconstruction after a fire in 1878. Two miles away is one of the island's great showplaces, Whim Greathouse, restored to depict the life of the sugar planters at their peak. Pop. (1990) 3,000.

Frédérix, Jacques: *see* Feyder, Jacques.

Fredholm, (Erik) Ivar (b. April 7, 1866, Stockholm—d. Aug. 17, 1927, Stockholm), Swedish mathematician who founded modern integral equation theory.

Fredholm entered the University of Uppsala in 1886. There, and later at the University of Stockholm (1888–93), he was mainly interested in mathematical physics. After receiving his Ph.D. from Uppsala in 1898 his interest turned to integral equations. He also worked as an actuary until 1906, when he was appointed professor of theoretical physics at the University of Stockholm.

In a paper that appeared in 1900 entitled "Sur une nouvelle méthode pour la résolution du problème de Dirichlet" ("On a New Method for the Resolution of Dirichlet's Problem"), Fredholm developed the essential parts of the theory of what is now known as Fredholm integral equations and solved the Fredholm equation of the second type, namely a definite integral.

Although he published only a few papers, Fredholm quickly gained a reputation throughout Europe for his comprehensive work. His efforts in large part inspired the later investigations of the German mathematician David Hilbert.

Fredonia, village in the town (township) of Pomfret, Chautauqua county, western New York, U.S., on the Canadaway Creek, near Lake Erie, immediately south of Dunkirk. Settled in 1804, its pseudo-Latin name, coined c. 1800 by Dr. Samuel Latham Mitchill and meaning "place of freedom," was originally proposed as the name of the nation. It was the site of the first natural gas well in the U.S. to be harnessed (1821) for illumination. The first local unit of the Grange (a fraternal organization of farmers) was established there in 1868, as was one of the first branches of the Woman's Christian Temperance Union (1873). There is some light manufacturing, but Fredonia's economy depends primarily on grapes from the surrounding vineyards. The New York State University College at Fredonia originated in 1826 as Fredonia Academy. Inc. 1829. Pop. (2000) 10,706.

Fredrik (Swedish personal name): *see under* Frederick.

Fredrikshald (Norway): *see* Halden.

Fredrikstad, town, Østfold *fylke* (county), south of Oslo, southeastern Norway. Located on the eastern shore of Oslofjorden at the mouth of the river Glåma, it was founded in 1567 by Frederick II as a fortress town and has remains of the original fortifications. Fredrikstad's excellent harbour, protected by the island of Kråkerøy, is open year-round. Sawmilling, shipping, and fishing are the main

industries; lumber, chemicals, granite, and feldspar are exported. Fredrikstad is known for its workshops that create models for the distinctive Norwegian products, notably glass, silverware, and textiles. The surrounding area is rich in rock carvings, monumental stones, and graves from the early Christian era. Pop. (1997 est.) mun., 51,600.

Fredro, Aleksander (b. June 20, 1793, Suchorów, Galicia—d. July 15, 1876, Lwów, Pol.), Polish comic dramatist whose work, influenced by Molière and by Goldoni, is remarkable for its brilliant characterization, ingenious construction, and skillful handling of verse metres.

Born to a wealthy and powerful landed family, Fredro was educated by private tutors. At the age of 16 he joined the cavalry division of the Polish Army and subsequently fought for the French in the Napoleonic Wars, including the Moscow campaign. In 1814 he spent a few months in Paris, where he attended plays and studied French drama. After leaving the army in 1815 to care for his estate at home, he began to write seriously. Among the more notable plays written during that period are *Mąż i żona* (produced 1822; "Husband and Wife"), a comedy of marital infidelity; *Śluby panieńskie* (1833; "Maidens' Vows"), concerned with psychological development; and *Zemsta* (1834; "Vengeance"), a brilliantly constructed comedy, considered to be his masterpiece. He abruptly stopped writing in 1835 after the extremist Romantic poet Seweryn Goszczyński said in a magazine article that Fredro's work was nonnational and full of absurdities. He returned to writing about 19 years later with several interesting plays; these did not, however, compare to his earlier productions. His memoirs, *Trzy po trzy* ("Topsy Turvy Talk"), written late in his life in the picaresque manner of Laurence Sterne, are considered to be among the most brilliant pieces of Polish prose.

Free Birth, Law of (Brazilian history): *see* Rio Branco Law.

free church, generally, any Protestant religious body that exists in or originates in a land having a state church but that is itself free of governmental or external ecclesiastical control. Examples of such free churches are the Baptists in Scotland, where the established church is Presbyterian; the Presbyterians in England, where the Anglican Church is established; the Waldensian Church in Italy, where the Roman Catholic Church is established; and the Mission Covenant Church in Sweden, where the established church is Lutheran.

In the narrower sense, the term free churches was first applied collectively to several nonepiscopal Protestant evangelical communions in England that convened the first Free Church Congress in 1892 and combined in 1896 to form the National Council of the Evangelical Free Churches. In 1940 this group merged with the Federal Council of the Evangelical Churches to form the Free Church Federal Council.

Free Church Federal Council, organization of free churches (not part of the Church of England) of England and Wales, including Methodist, Baptist, the United Reformed Church in England and Wales (a Presbyterian-Congregational merger), and some other churches. It was formed in 1940 by the union of the National Council of the Evangelical Free Churches (founded 1896) and the Federal Council of the Evangelical Free Churches (founded 1919) for the purpose of cooperating in matters of mutual concern.

The council is presided over by a moderator who holds office for one year. It works through local councils, which elect representatives to the national council and send delegates to an annual congress. The member denominations

send direct representatives to congress and council.

Free Church of Scotland, church organized in 1843 by dissenting members of the Church of Scotland. The disruption was the result of tensions that had existed within the Church of Scotland, primarily because of the development early in the 18th century of two groups within the church—the Moderates, who were primarily interested in social activities, in culture, and in their position within the established church, and the Evangelicals, who were stricter Calvinists who believed in adherence to the Westminster Confession. Patronage, approved by the British Parliament in 1712, allowed wealthy landowners to appoint ministers to local churches, and the church came to be controlled by the Moderates. In the 19th century the Evangelicals became stronger and insisted on more freedom from the state and the right of congregations to elect their own ministers. When the courts and Parliament upheld the patrons' rights to appoint ministers, many Evangelicals decided that they must leave the established church.

At the opening session of the General Assembly of the Church of Scotland on May 18, 1843, the Evangelicals read a statement that it was impossible to hold a free assembly of the church. They then went to another hall and organized the first General Assembly of the Free Church of Scotland. Thomas Chalmers (*q.v.*) was elected the first moderator. Considered more than a secession from the established church, the event came to be known as the Disruption.

The new church was made up of about one-third of the ministers and laity of the Church of Scotland. Giving up all claims to income, churches, professorships, and ministers' homes provided by the established church, the new church set up voluntary funds that supported ministers, built new churches, homes, and schools, and provided for missionary work.

The accomplishments of the Free Church within a few years were remarkable, and under strong leadership it was a powerful force in Scotland. It adjusted to cultural change, provided new churches for the population, and gradually accepted new approaches to biblical interpretation that caused some dissension.

In 1900 the Free Church united with the United Presbyterian Church (formed in 1847 by earlier dissenting groups) to form the United Free Church. By 1929 patronage had been abolished in the Church of Scotland, and that church had been disestablished and the United Free Church consequently reunited with it.

A minority of the Free Church members protested the union with the United Presbyterian Church and continued as the Free Church of Scotland. The congregations were mainly in the Gaelic-speaking districts in the Highlands and islands.

Free Corps (German paramilitary group): *see* Freikorps.

Free Democratic Party, German FREIE DEMOKRATISCHE PARTEI (FDP), German centrist political party that advocates individualism and free economic competition. Although it has a relatively small following, it has made and broken governments by forming coalitions with larger parties.

Delegates from liberal parties in the American, British, and French zones of occupation formed the FDP in December 1948. In the West Germany of the early 1950s the FDP took part in the coalition government of the Christian Democratic Union (CDU). It left the coalition in 1956 to join with the Social Democratic Party (SPD) as an opposition party. After the national elections in 1961, when the CDU and its coalition partner, the Christian Social Union (CSU), lost their absolute majority, the FDP exacted the promise of

Chancellor Konrad Adenauer's resignation as the price of its cooperation in a new coalition. The FDP's disillusionment with the policies of the new chancellor, Ludwig Erhard, appears to have been the main motive for the party's second withdrawal from its coalition with the Christian Democrats in November 1966. After national elections in 1969, the FDP joined forces with the SPD to overcome the CDU-CSU plurality in the national assembly and elect the SPD leader Willy Brandt chancellor. The FDP remained in coalition with the SPD until 1982, when it formed a coalition government with the Christian Democrats and Christian Social Union. After the 1983 and 1987 parliamentary elections, the FDP remained part of a governing coalition with the CDU and the CSU.

free-electron model of metals, in solid-state physics, representation of a metallic solid as a container filled with a gas composed of free electrons (*i.e.*, those responsible for high electrical and thermal conductivity) that move in a virtually uniform potential arising largely from metal ions in the crystal lattice. The free electrons, considered identical to the valence electrons of free metal atoms, are presumed to be moving independently of one another throughout the entire crystal.

The free-electron model was first proposed by the Dutch physicist Hendrik A. Lorentz shortly after 1900 and was refined in 1928 by Arnold Sommerfeld of Germany. Sommerfeld introduced quantum-mechanical concepts, most notably the Pauli exclusion principle (*q.v.*). Although the model provided a satisfactory explanation for certain properties (*e.g.*, conductivity and electronic specific heat) of simple monovalent metals, it had some serious shortcomings. It did not, for example, take into account the interaction of free electrons with the metal ions. Researchers soon recognized that a broader system was needed to explain the behaviour of complex metals and semiconductors. By the mid-1930s the free-electron model was largely superseded by the band theory (*q.v.*) of solids.

free energy, in thermodynamics, energylike property or state function of a system in thermodynamic equilibrium—it has the dimensions of energy and its value is determined by the state of the system and not by its history—expressed in two forms: the Helmholtz free energy, A , sometimes called work function, and the Gibbs free energy, G , sometimes F . If E is the internal energy of the system, PV the pressure-volume product, and TS the temperature-entropy product, then $A = E - TS$ and $G = E + PV - TS$. Free energy is an extensive property; *i.e.*, the magnitude depends on the amount of the substance present in a given thermodynamic state.

The changes in free energy, ΔA or ΔG , are useful in evaluating certain thermodynamic processes. In a reversible process, the work under constant temperature and constant volume is equal to the change in the Helmholtz free energy, ΔA , and the work under constant temperature and constant pressure is equal to the change in the Gibbs free energy, ΔG .

Changes in free energy can be used to judge whether certain transformations of state can occur spontaneously. Under certain conditions of constant temperature and volume, the transformation of state will occur spontaneously, slowly or rapidly, if the Helmholtz free energy of the final state is smaller than that of the initial state; that is, if the difference ΔA between the final and the initial state is negative. Under conditions of constant temperature and pressure, the transformation of state will occur if the change in the Gibbs free energy, ΔG , is negative.

free enterprise economy: *see* capitalism.

free-fall, in mechanics, state of a body that moves freely in any manner in the presence

of gravity. The planets, for example, are in free-fall in the gravitational field of the Sun. Newton's laws show that a body in free-fall follows an orbit such that the sum of the gravitational and inertial forces equals zero. This explains why an astronaut in a spacecraft orbiting the Earth experiences a condition of weightlessness: the Earth's gravitational pull is equal and opposite to the inertial—in this case, centrifugal—force because of the motion of the vehicle. Gravitational forces are never uniform, and therefore only the centre of mass is in free-fall. All other points of a body are subject to tidal forces because they move in a slightly different gravitational field. The Earth is in free-fall, but the pull of the Moon is not the same at the Earth's surface as at its centre; the rise and fall of ocean tides occur because the oceans are not in perfect free-fall.

Free French, French FRANÇAISES LIBRES, in World War II (1939–45), members of a movement for the continuation of warfare against Germany after the military collapse of Metropolitan France in the summer of 1940. Led by General Charles de Gaulle, the Free French were eventually able to unify most French resistance forces in their struggle against Germany.

On June 16, 1940, the government of France was constitutionally transmitted to Marshal Philippe Pétain, who had already decided that France must conclude an armistice with Germany. Two days later, a French army officer, General Charles de Gaulle, appealed by radio from London (whence he had fled on June 17) for a French continuation of the war against Germany. On June 28 de Gaulle was recognized by the British as the leader of Free France (as the nascent resistance movement was named), and from his base in London de Gaulle began to build up the Forces Françaises Libres, or Free French Forces. At first these consisted merely of French troops in England, volunteers from the French community resident in England since prewar times, and a few units of the French navy.

In the autumn of 1940 the French colonial territories of Chad, Cameroun, Moyen-Congo, French Equatorial Africa, and Oubangi-Chari (all in sub-Saharan Africa) rallied to de Gaulle's Free France, and the smaller French colonies in India and in the Pacific soon followed suit. A Free French military expedition in September 1940 to capture the important naval base of Dakar in French West Africa failed, however, and the base remained in the hands of French forces loyal to the national government that Pétain had set up in Vichy.

In 1941 Free French forces participated in British-controlled operations against Italian forces in Libya and Egypt, and that same year they joined the British in defeating the Vichy forces in Syria and Lebanon. In September de Gaulle created the Comité National Français (French National Committee), a Free French government-in-exile that was recognized by the Allied governments.

Despite these gains, the Free French remained a small force until 1942, by which time an underground anti-Nazi Résistance movement had sprung up in France. In his efforts to obtain the support of the Résistance, de Gaulle changed the name of his movement to Forces Françaises Combattantes (Fighting French Forces) and sent his emissary Jean Moulin to France to try to unify all the various Résistance groups in France under de Gaulle's leadership. Moulin came close to accomplishing this in May 1943 with his establishment of the Conseil Nationale de la Résistance (National Council of the Resistance).

The successful Anglo-American invasion of northwestern Africa in November 1942 resulted in the defection of most of the Vichy

troops stationed there to the side of the Free French. De Gaulle then entered a power struggle with the Allied-backed commander in chief of the French forces in North Africa, General Henri Giraud. In June 1943 a Comité Français de Libération Nationale (French Committee of National Liberation) was constituted in Algiers, with Giraud and de Gaulle as its joint presidents. But de Gaulle soon outmaneuvered Giraud, whose resignation in the spring of 1944 left de Gaulle in supreme control of the entire French war effort outside of Metropolitan France. More and more Résistance groups were meanwhile acknowledging de Gaulle's leadership.

More than 100,000 Free French troops fought in the Anglo-American campaign in Italy in 1943, and, by the time of the Allied invasion of Normandy in June 1944, the Free French forces had swelled to more than 300,000 regular troops. They were almost wholly American-equipped and supplied. In August 1944 the Free French 1st Army, under General Jean de Lattre de Tassigny, took part in the Allies' invasion of southern France, driving thence northeastward into Alsace before joining in the Western Allies' final thrust into Germany. In August 1944 the Résistance groups, now organized as Forces Françaises de l'Intérieur (French Forces of the Interior), mounted an anti-German insurrection in Paris, and the Free French 2nd Armoured Division under General Jacques-Philippe Leclerc drove into Paris to consummate the liberation. On Aug. 26, 1944, de Gaulle entered Paris in triumph.

free imperial city: *see* imperial city.

free jazz, an approach to jazz improvisation that emerged during the late 1950s, reached its height in the '60s, and remained a major development in jazz thereafter.

The main characteristic of free jazz is that there are no rules. Musicians do not adhere to a fixed harmonic structure (predetermined chord progressions) as they improvise; instead, they modulate (*i.e.*, change keys) at will. Free jazz improvisers typically phrase in chromatic intervals and harmonies, and some achieve atonality while playing in microtones, overtones, multiphonics (simultaneous notes played on one horn), and tone clusters. Free jazz performers often improvise without observing fixed metres or tempos. Solo and accompaniment roles tend to be fluid, as does the balance of composition and improvisation in a performance. The ultimate development of free jazz is free improvisation, which combines all these qualities—using no fixed instrumental roles or harmonic, rhythmic, or melodic structures and abandoning composition altogether.

As early as the 1940s, jazz musicians, most notably pianist Lennie Tristano and composer Bob Graettinger, created a handful of works using free jazz elements. Effectively, free jazz began with the small groups led in 1958–59 by alto saxophonist Ornette Coleman, from whose album *Free Jazz* (1960) the idiom received its name.

BIBLIOGRAPHY. John Litweiler, *The Freedom Principle: Jazz After 1958* (1984, reprinted 1990), is a critical history of free jazz. Valerie Wilmer, *As Serious as Your Life* (1977), examines free jazz from social as well as biographical perspectives.

Free Laos: *see* Lao Issara.

free market economy: *see* capitalism.

free radical (chemistry): *see* radical.

Free Silver Movement, advocacy of unlimited coinage of silver in the late 19th-century United States. The movement was precipitated by an act of Congress in 1873 that omitted the silver dollar from the list of authorized coins (the "Crime of '73"). Supporters of

free silver included owners of silver mines in the West, farmers who believed that an expanded currency would increase the price of their crops, and debtors hoping it would enable them to pay their debts more easily. For true believers, silver became the symbol of economic justice for the American people.

The Free Silver Movement gained political strength at the outset because of the sharp economic depression of the mid-1870s. Its first significant success was the enactment of the Bland-Allison Act in 1878, which restored the silver dollar as legal tender and required the U.S. Treasury to purchase each month between \$2,000,000 and \$4,000,000 worth of silver and coin it into dollars. When farm prices improved in the early 1880s, pressure for new monetary legislation declined, but the collapse of land and farm prices beginning in 1887 revived the demand by farmers for the unlimited coinage of silver. Congress responded in 1890 by enactment of the Sherman Silver Purchase Act, increasing the government's monthly silver purchases by 50 percent.

In the years immediately after 1890, a combination of pressures sharply reduced the amount of gold in the U.S. Treasury, precipitating a panic in the spring of 1893. Conservatives charged that the Sherman Act was the cause of the panic, and in the summer of 1893 Congress repealed that act. Farmers in the South and West condemned this action, blamed the greed of eastern bankers for the depressed state of the economy, and resumed their demand for the unlimited coinage of silver. This had been an important objective of the Populist Party in the election of 1892, and in 1896 the Democrats, despite strong opposition from President Grover Cleveland, made unlimited coinage of silver the principal plank in their platform. They then nominated William Jennings Bryan, the most effective champion of free silver (*see* Cross of Gold speech), as their candidate for president. The Republicans won the election, and in 1900 a Republican majority in Congress enacted the Gold Standard Act, which made gold the sole standard for all currency.

Free-Soil Party (1848–54), minor but influential political party in the pre-Civil War period of American history that opposed the extension of slavery into the western territories. Fearful of expanding slave power within the national government, Representative David Wilmot of Pennsylvania in 1846 introduced into Congress his famous Wilmot Proviso, calling for the prohibition of slavery in the vast southwestern lands that had been newly acquired from Mexico. The Wilmot concept, which failed in Congress, was a direct ideological antecedent to the Free-Soil Party. Disappointed by the ambivalent position of the Whig Party toward slavery, "Conscience" Whigs held a convention in August 1848 at Buffalo, N.Y. There they were joined by delegates from 17 states drawn from the Liberty Party (*q.v.*) and the antislavery faction of the New York Democrats, known as "Barnburners." The Free-Soilers' historic slogan calling for "free soil, free speech, free labor, and free men" attracted small farmers, debtors, village merchants, and household and mill workers, who resented the prospect of black-labour competition—whether slave or free—in the territories.

In 1848 the Free-Soil Party nominated the former U.S. president Martin Van Buren to head its ticket. Though the party polled only 10 percent of the popular vote in the presidential election that year, it weakened the regular Democratic candidate in New York and contributed to the election of the Whig candidate General Zachary Taylor as president. The Free-Soil vote was reduced to 5 percent in 1852, when John P. Hale was the presidential nominee. Nevertheless, a dozen Free-Soil congressmen later held the balance of power in the

House of Representatives, thus wielding considerable influence. In addition, the party was well represented in several state legislatures. In 1854 the disorganized remnants of the party were absorbed into the newly formed Republican Party, which carried the Free-Soil idea of opposing the expansion of slavery one step further by condemning slavery as a moral evil as well.

free-space room (acoustics): *see* anechoic chamber.

Free State, province, east-central Republic of South Africa. Under the name Orange Free State (*q.v.*), it was originally a Boer state and then (from 1910) one of the traditional provinces of South Africa; it was renamed Free State in 1995. Free State is bordered on the north by North-West, Gauteng, and Mpumalanga provinces, on the east by KwaZulu-Natal province and the independent state of Lesotho, on the south by Eastern Cape province, and on the west by Northern Cape province. The provincial capital, Bloemfontein, is also the national judicial capital.

The province is located on the Highveld, a plateau rising to elevations of 6,000 feet (1,800 m) in the east and sloping to about 4,000 feet (1,200 m) in the west. Two streams drain the province: the upper Orange River, which forms the province's southern boundary, and the Vaal River, part of its northern boundary. The climate varies from warm and temperate with an annual rainfall of 40 inches (1,020 mm) in the east to semiarid with rainfall of only 15 inches (380 mm) in the far west. Mean annual surface temperatures gradually increase from about 58° F (14° C) in the east to 62° F (17° C) in the west. Frost is common over the entire province from May to September, and, because rainfall is unreliable, long periods of drought are frequent.

Blacks make up more than three-fourths of the province's population; whites, less than one-tenth. More than three-fifths of the population speak Sotho, and about one-tenth speak Afrikaans. Several other languages are also spoken. A large proportion of whites live in cities and towns, while the majority of blacks reside in rural areas.

Free State possesses sizable deposits of gold, coal, salt, and bentonite. Much of the coal is transformed into oil and other petroleum products at Sasolburg. The province produces more than one-third of South Africa's corn (maize), and wheat is also an important crop. Undulating plains provide excellent grazing for sheep, and Free State produces about one-sixth of all South Africa's wool.

The University of the Free State (1904) is located in Bloemfontein. Free State is also home to Vredefort Dome, the world's oldest and largest meteorite impact site, which was designated a UNESCO World Heritage site in 2005. Area 49,993 square miles (129,480 square km). Pop. (2005 est.) 2,953,100.

free-tailed bat, also called MASTIFF BAT, any of about 90 species of bats of the family

Mexican free-tailed bat (*Tadarida brasiliensis mexicana*)

Merlin D. Tuttle/Bat Conservation International

Molossidae, suborder Microchiroptera. Free-tailed bats are found worldwide in warm regions. Their common name is descriptive of the way in which part of the tail extends beyond the membrane attached between the hind legs. Free-tailed bats are also known as mastiff, or bulldog, bats because of their supposed facial resemblance to these dogs.

Swift fliers with stout bodies and long, slender wings, free-tailed bats are small-eyed, often heavy-snouted bats about 4–13 cm (1.6–5 inches) long excluding the 1.5–8-centimetre (0.6–3-inch) tail. Their ears are large and are joined across the forehead in some species. Except for the naked free-tailed bat (*Cheiromeles*), which is almost hairless, they have short, usually dark fur.

Free-tailed bats eat insects and roost in tree hollows, caves, and buildings. Most species live in groups, and some, such as the Mexican free-tailed bat (*Tadarida brasiliensis mexicana*), form colonies of several million individuals. In the past, guano from this species' colonies was mined for fertilizer and for sodium nitrate, which was used to make gunpowder. Free-tailed bats do not hibernate, but some species become inactive in winter; other species migrate seasonally.

free trade, policy by which a government does not discriminate against imports or interfere with exports. It does not necessarily imply that a country abandons all control and taxation of imports and exports.

The theoretical case for free trade is based on the argument of Adam Smith that the division of labour among countries leads to specialization, greater efficiency, and higher aggregate production. From the point of view of a single country there may be practical advantages in restriction, particularly if the country is the main buyer or seller of a commodity. In practice, however, the protection of local industries may prove advantageous only to a small minority of the population, and disadvantageous to the rest.

Since World War II considerable efforts have been made to reduce tariff barriers and currency restrictions among nations. Other barriers, however, that may be equally effective in hindering trade include import quotas, taxes, and subsidies to domestic industries.

free-trade zone, also called FOREIGN-TRADE ZONE, formerly FREE PORT, an area within which goods may be landed, handled, manufactured or reconfigured, and re-exported without the intervention of the customs authorities. Only when the goods are moved to consumers within the country in which the zone is located do they become subject to the prevailing customs duties. Free-trade zones are organized around major seaports, international airports, and national frontiers—areas with many geographic advantages for trade. Examples include Hong Kong, Singapore, Colón (Panama), Copenhagen, Stockholm, Gdańsk (Poland), Los Angeles, and New York City. Alternative devices such as the bonded warehouse and associated systems are used in some large seaports (e.g., London and Amsterdam).

The primary purpose of a free-trade zone is to remove from a seaport, airport, or border those hindrances to trade caused by high tariffs and complex customs regulations. Among the advantages of the system are the quicker turnaround of ships and planes through the reduction in formalities of customs examinations and also the ability to fabricate, refinish, and store goods freely.

The number of worldwide free-trade zones proliferated in the late 20th century, expanding from 133 zones in 1970 to 614 in 1990. In the United States free-trade zones were first authorized in 1934, but only about a dozen were established before 1970; by the mid-1990s, however, there were more than 200 such zones, with about 250 subzones.

free verse, poetry organized to the cadences of speech and image patterns rather than according to a regular metrical scheme. It is "free" only in a relative sense. It does not have the steady, abstract rhythm of traditional poetry; its rhythms are based on patterned elements such as sounds, words, phrases, sentences, and paragraphs, rather than on the traditional prosodic units of metrical feet per line. Free verse, therefore, eliminates much of the artificiality and some of the aesthetic distance of poetic expression and substitutes a flexible formal organization suited to the modern idiom and more casual tonality of the language.

Although the term is loosely applied to the poetry of Walt Whitman and even earlier experiments with irregular metres, it was originally a literal translation of *vers libre* (*q.v.*), the name of a movement that originated in France in the 1880s. Free verse became current in English poetics in the early 20th century. The first English-language poets to be influenced by *vers libre*, notably T.E. Hulme, F.S. Flint, Richard Aldington, Ezra Pound, and T.S. Eliot, were students of French poetry. The Imagist movement, started in England in 1912 by Aldington, Pound, Flint, and Hilda Doolittle ("H.D."), was concerned with more than versification, but one of its principles was "to compose in sequence of the musical phrase, not in sequence of the metronome." Almost from the beginning, the free-verse movement split into two groups, one led by Amy Lowell and a more formal one led by Pound. Eliot's early experimentations with free verse influenced the loosening of formal metrical structures in English-language poetry. Carl Sandburg, William Carlos Williams, Marianne Moore, and Wallace Stevens all wrote some variety of free verse; the versification of Williams and Moore most closely resembles that of the *vers libre* poets of France.

free will, in humans, the power or capacity to choose among alternatives or to act in certain situations independently of natural, social, or divine restraints. Free will is denied by those who espouse any of various forms of determinism. Arguments for free will are based on the subjective experience of freedom, on sentiments of guilt, on revealed religion, and on the universal supposition of responsibility for personal actions that underlies the concepts of law, reward, punishment, and incentive. In theology, the existence of free will must be reconciled with God's omniscience and goodness (in allowing man to choose badly), and with divine grace, which allegedly is necessary for any meritorious act. A prominent feature of modern Existentialism is the concept of a radical, perpetual, and frequently agonizing freedom of choice. Jean-Paul Sartre, for example, speaks of the individual "condemned to be free" even though his situation may be wholly determined.

freeboard, distance from the waterline to the freeboard deck of a fully loaded ship; it is measured amidships at the side of the hull. The freeboard deck is the deck below which all bulkheads are made watertight; above it that precaution is not necessary. Freeboard represents the safety margin showing to what depths a ship may be loaded under various service conditions—e.g., the type of cargo, the waters to be navigated, and the season of the year. Freeboard is determined by the design of the vessel, particularly the shape and dimensions of its watertight hull; by its structural strength; and, in the case of a passenger ship, by the subdivision of its watertight compartments. Definite freeboard rules, based on the provision of adequate reserve buoyancy, were first established in the second half of the 19th century, largely through the efforts of Samuel Plimsoll, a British politician and social reformer. *See also* Plimsoll line.

freedman, former slave set free. In ancient Athens, former slaves bore no stigma, and some rose to positions of political or economic power. During the later Hellenistic period, however, some Greek communities passed laws providing separate regulations and restrictions for former slaves. To the Greeks citizenship was a hereditary privilege and thus barred to freedmen, but under Roman law a manumitted slave might become a citizen if the proper legal form was followed, although he did not enjoy full civic rights. In Carolingian times the descendants of a freedman could claim the rights of the freeborn only after three generations had passed.

Later, notably in the conditions of North American blacks from colonial times forward, racial differences between slaves and owners reinforced the tendency to attach the stigma of slavery to freedmen and the free offspring of slaves. *See* Reconstruction; Freedmen's Bureau; black code; Union Leagues; lynching.

Consult the INDEX first

Freedmen's Bureau (1865–72), during the Reconstruction period after the American Civil War, popular name for the U.S. Bureau of Refugees, Freedmen, and Abandoned Lands, established by Congress to provide practical aid to 4,000,000 newly freed black Americans in their transition from slavery to freedom. Headed by Major General Oliver O. Howard, the Freedmen's Bureau might be termed the first federal welfare agency. Despite handicaps of inadequate funds and poorly trained personnel, the bureau built hospitals for, and gave direct medical assistance to, more than 1,000,000 freedmen. More than 21,000,000 rations were distributed to impoverished blacks as well as whites.

Its greatest accomplishments were in education: more than 1,000 black schools were built and over \$400,000 spent to establish teacher-training institutions. All major black colleges were either founded by, or received aid from, the bureau. Less success was achieved in civil rights, for the bureau's own courts were poorly organized and short-lived, and only the barest forms of due process of law for freedmen could be sustained in the civil courts. Its most notable failure concerned the land itself. Thwarted by President Andrew Johnson's restoration of abandoned lands to pardoned Southerners and by the adamant refusal of Congress to consider any form of land redistribution, the bureau was forced to oversee sharecropping arrangements that inevitably became oppressive. Congress, preoccupied with other national interests and responding to the continued hostility of white Southerners, terminated the bureau in July 1872.

freedom, degree of, in mathematics, any of the number of independent quantities necessary to express the values of all the variable properties of a system. A system composed of a point moving in space, for example, has three degrees of freedom because three coordinates are needed to determine the position of the point.

The number of degrees of freedom is reduced by constraints such as the requirement that a point move along a particular path. Thus, a simple pendulum has only one degree of freedom because its angle of inclination is specified by a single number. In a chemical system, the condition of equilibrium imposes constraints: properties such as temperature and composition of coexisting phases cannot all vary independently (*see* phase rule).

If, in a statistical sample distribution, there are n variables and m constraints on the distribution, there are $n - m$ degrees of freedom.

freehold, in English law, ownership of a substantial interest in land held for an indefinite period of time. The term originally designated the owner of an estate held in free tenure, who possessed, under Magna Carta, the rights of a free man. A freehold estate was distinguished from nonfreehold estates such as copyhold, tenancy at will, and tenancy for a fixed period, the customary landlord-tenant relationship. Knight service and frankalmoin, which required military and ceremonial services respectively, and free socage, which involved certain services of husbandry or manual labour, were types of free tenure. *See also* copyhold; socage.

Freeman, Douglas Southall (b. May 16, 1886, Lynchburg, Va., U.S.—d. June 13, 1953, Westbourne, Hampton Gardens, near Richmond, Va.), American journalist and author noted for writings on the Confederacy.

After receiving degrees from Johns Hopkins University and Washington and Lee University, Freeman began a long and distinguished teaching career. Among numerous other posts, he served for a year (1934–35) as a visiting professor of journalism at Columbia University, remaining on the faculty as a nonresident from 1936 to 1941. From 1936 on he was also a lecturer at the Army War College. And from 1915 to 1949 Freeman edited the Richmond (Va.) *News Leader*.

Among his honorary appointments and affiliations, Freeman was a member of the advisory council of the War Department's History Division and of the Presidential Committee on Higher Education. In 1935 Freeman won the Pulitzer Prize for his four-volume biography, *R. E. Lee*.

His other works include *Virginia—A Gentle Dominion* (1924); *The Last Parade* (1932); *The South to Posterity: An Introduction to the Writings of Confederate History* (1939); *Lee's Lieutenants, A Study in Command*, 3 vol. (1942–44); *John Steward Bryan* (1947); and *George Washington*, 7 vol. (1948–57), the final volume of which was prepared by his assistants after his death—the whole work earning him a second, posthumous Pulitzer Prize in 1958.

Freeman, Mary Eleanor Wilkins, née WILKINS (b. Oct. 31, 1852, Randolph, Mass., U.S.—d. March 13, 1930, Metuchen, N.J.), American writer known for her stories and novels of frustrated lives in New England villages.

In 1867 the Wilkins family moved to Brattleboro, Vt., where Mary graduated from high school. After one year at Mount Holyoke Female Seminary, South Hadley, Mass., she began writing stories and verse for children to help support her family, and she quickly became successful. Returning to Randolph, she did her best writing there in the 1880s and '90s. In 1902 she married Charles M. Freeman of Metuchen, N.J., where she lived until her death.

Although she produced a dozen volumes of short stories and as many novels, Freeman is remembered chiefly for the first two collections of stories, *A Humble Romance and Other Stories* (1887) and *A New England Nun and Other Stories* (1891), and the novel *Pembroke* (1894). Edward Foster's *Mary E. Wilkins Freeman* (1956) is a critical study.

Freeman, Sir Ralph (b. Nov. 27, 1880, London—d. March 11, 1950, London), English civil engineer whose Sydney Harbour Bridge (1932), New South Wales, with a main arch span of 1,650 feet (500 m), is one of the longest steel-arch bridges in the world.

In 1901 Freeman joined a London firm of consulting engineers, later known as Freeman, Fox & Partners. His works include the Vic-

toria Falls Bridge over the Zambezi River, on the border of present-day Zimbabwe and Zambia; the Royal Naval Propellant factory built during World War II; the Furness shipbuilding yard in Lancashire; and five major bridges in southern Africa. He also prepared designs for the bridge over Auckland Harbour, New Zealand.

From 1928 to 1936 he was a member of the Steel Structures Research Committee, a British organization, and chairman of the panel responsible for effecting the committee's designs. He was knighted in 1947.

Freeman, Richard Austin (b. 1862, London—d. Sept. 30, 1943, Gravesend, Kent, Eng.), popular English author of novels and short stories featuring the fictional character John Thorndyke, a pathologist-detective.

Richard Austin Freeman, c. 1935
C.V. Briant

Educated as a physician and surgeon, Freeman practiced in the Gold Coast (now Ghana), where he caught a fever. Eventually forced by ill health to retire from practice (1904), he began to write fiction. *The Red Thumb Mark* (1907) was the first of many works featuring Thorndyke.

Freemasonry, the teachings and practices of the secret fraternal order of Free and Accepted Masons, the largest worldwide secret society. Spread by the advance of the British Empire, Freemasonry remains most popular in the British Isles and in other countries originally within the empire.

Freemasonry evolved from the guilds of stonemasons and cathedral builders of the Middle Ages. With the decline of cathedral building, some lodges of operative (working) masons began to accept honorary members to bolster their declining membership. From a few of these lodges developed modern symbolic or speculative Freemasonry, which particularly in the 17th and 18th centuries, adopted the rites and trappings of ancient religious orders and of chivalric brotherhoods. In 1717 the first Grand Lodge, an association of lodges, was founded in England.

Freemasonry has, almost from its inception, encountered considerable opposition from organized religion, especially from the Roman Catholic Church, and from various states.

Though often mistaken for such, Freemasonry is not a Christian institution. Freemasonry contains many of the elements of a religion; its teachings enjoin morality, charity, and obedience to the law of the land. For admission the applicant is required to be an adult male believing in the existence of a Supreme Being and in the immortality of the soul. In practice, some lodges have been charged with prejudice against Jews, Catholics, and nonwhites. Generally, Freemasonry in Latin countries has attracted freethinkers and anticlericals, whereas in the Anglo-Saxon countries, the membership is drawn largely from among white Protestants.

In most lodges in most countries, Freemasons are divided into three major degrees—entered apprentice, fellow of the craft, and master mason. In many lodges there are nu-

merous degrees—sometimes as many as a thousand—superimposed on the three major divisions; these organizational features are not uniform from country to country.

In addition to the main body of Freemasonry derived from the British tradition, there are now a number of appendant groups that are primarily social or fun organizations, which have no official standing in Freemasonry but which draw their membership from the higher degrees of Freemasonry. They are especially prevalent in the United States. Among those known for their charitable work are the Ancient Arabic Order of the Nobles of the Mystic Shrine (the "Shriners"). Female relatives of Master Masons may join the Order of the Eastern Star; boys, the Order of DeMolay and the Order of Builders; and girls, the Order of Job's Daughters and the Order of Rainbow. English Masons are forbidden to affiliate with any of the fun organizations or quasi-Masonic societies, on pain of suspension.

Freeport, town, southwestern shore of Grand Bahama island, The Bahamas. In 1955 the colonial Bahamian government entered into the so-called Hawksbill Creek Agreement with the newly created Grand Bahama Port Authority Limited (headed by an American lumber financier, Wallace Groves), which was pledged to plan, construct, and administer a "Port Area" (Freeport) and to license businesses and industries therein in exchange for various tax exemptions and privileges for 99 years. (Subsequent amendments revised the prerogatives of the Port Authority, but it still remains.) So successful was the venture that the population of Freeport, 150 persons in 1956, multiplied more than a hundredfold in the coming decades, and the town and neighbouring resorts drew about 500,000 tourists a year in the late 20th century. Freeport is the site of hotels, golf courses, developed beaches, one of the world's largest casinos, and the International Bazaar, which houses a variety of exotic duty-free shops. Freeport is also the location of a giant petrochemical transshipment complex and of banks catering to foreign financial interests. Pop. (1990) 26,574.

Freeport, city, seat (1837) of Stephenson county, northwestern Illinois, U.S., on the Pecatonica River. Founded in 1835, it was settled by Pennsylvania Germans disappointed with the conditions in the Galena lead-mining district, 40 miles (64 km) west. The settlement (called Winneshiek) supposedly became known as "Free Port" because of a protest by the wife of William Baker, a trader, who freely entertained travelers. With the coming of the Galena and Chicago Union Railroad (1853), followed by the Illinois Central and Racine and Mississippi railroads, Freeport developed as a trading and shipping point for agricultural produce. Its economic base has diversified to include light manufacturing and a sizeable insurance industry.

On Aug. 27, 1858, Freeport was the scene of the second Lincoln-Douglas debate, during which Stephen Douglas formulated the "Freeport Doctrine" that a territory had the right to exclude slavery in spite of contrary Supreme Court decisions. "Lincoln the Debater," a statue by Leonard Crunelle in Taylor Park, commemorates the debate. Highland Community College was established in 1962 in Freeport. A farm museum is maintained by the Stephenson County Historical Society. Inc. 1855. Pop. (2000) 26,443.

Freeport, city, Brazoria county, southeastern Texas, U.S., at the mouth of the Brazos River, on the Gulf Intracoastal Waterway, 60 miles (97 km) south of Houston. Founded in 1912 by exploiters of local sulfur deposits, it was developed as a deepwater port and now forms part of the industrial complex of Brazosport. It processes and exports chemicals and gasoline. Commercial fishing

(shrimp) is also significant. A large-scale salt-water conversion plant is immediately east. Velasco, which served as temporary capital of the Texas Republic and where the treaty concluding the Texas Revolution was signed (1836), was annexed by Freeport in 1957. A lighthouse (1896) is at the river's mouth. Inc. 1949. Pop. (2000) 12,708.

Freer Gallery of Art, museum in Washington, D.C., endowed and built by the Detroit industrialist Charles Lang Freer to house the distinguished collection of Oriental art that he gave to the United States government in 1906. The Freer Gallery was administratively made a part of the Smithsonian Institution, and in 1923 it was opened to the public.

The Freer collection includes 19th-century American paintings and has the world's largest collection of Whistler's works, including the famed Peacock Room, decorated by Whistler as a prank. It was originally the dining room of an English shipbuilder, who after purchasing Whistler's painting "Rose and Silver: The Princess from the Land of Porcelain," permitted the artist to redecorate the room to harmonize with the picture. Using the peacock as his theme, Whistler trimmed borders off Oriental rugs and painted over leather wallcovering to create an exotic gold and turquoise atmosphere for his painting. The Freer Gallery is allied with the Arthur M. Sackler Gallery, which was opened in 1987 and houses Asian art donated to the Smithsonian by Sackler, a New York physician.

Freesia, genus of about 20 species of South African plants of the iris family (Iridaceae), with bulblike structures (corms), grassy foliage, and wiry spikes of bell-like, sweet-

AFP—Corbis

feet) in diameter for world championship or Olympic matches. Since 1989, the duration of a bout has been five minutes, in a single round. Prior to then, bouts had consisted of two or three three-minute rounds.

The bout is supervised by a referee on the mat, a mat chairman, a judge, and a timekeeper. The aim is to pin the opponent—that is, to hold both of his (or her) shoulders to the mat for one second. This is known as a fall. If no fall takes place, the bout is decided on points which are awarded by the judges for maneuvers showing technical superiority.

Wrestlers may compete in only one class in any one contest. Weight classes (upper limits) in Olympic and international events as of 2002 for men are: 55 kg (121 pounds), 60 kg (132 pounds), 66 kg (145.2 pounds), 74 kg (162.8 pounds), 84 kg (184.8 pounds), 96 kg (211.2 pounds), and 120 kg (264 pounds). For women the weight classes (upper limits) are: 48 kg (105.6 pounds), 51 kg (112.2 pounds), 55 kg (121 pounds), 59 kg (129.8 pounds), 63 kg (138.6 pounds), 67 kg (147.4 pounds), and 72 kg (158.4 pounds).

All modern Olympics, except those at the 1900 Games, have featured men's freestyle wrestling. The 2004 Olympics in Athens will be the first to feature women's freestyle wrestling. The weight classes contested there for women will be 48 kg, 55 kg, 63 kg, and 72 kg. For world champions, see *Sporting Record: Wrestling*. See also Olympic Games.

Freeport, capital, chief port, and largest city of Sierra Leone, on the rocky Sierra Leone Peninsula, at the seaward tip of a range of wooded hills, which were named Serra Leôa ("Lion Mountains") by the Portuguese navi-

Freeport, Sierra Leone, and its harbour

Shostal

gator Pedro da Sintra when he explored the West African coast in 1462. By the 1650s the increased activity of British, French, Dutch, and Danish trading companies ended the limited degree of Portuguese control over the

coastal trade. An English abolitionist, Granville Sharp, selected the site (south of the mouth of the Sierra Leone River) in 1787 as a haven for African slaves, freed and destitute in England. (They were known as the Black Poor.) In 1792 the Sierra Leone Company assumed responsibility and helped settle slaves from Nova Scotia who had fought for the British in the American Revolutionary War, the "Maroons," runaway slaves of Jamaica, and others from captured slave ships. They were landed at King Jimmy's Watering Place (now a bustling marketplace). Their descendants, known as Creoles, are now outnumbered by Mende and Temne immigrants from the interior. In 1821 Freetown became the seat of government for all of Great Britain's West African possessions, a position it retained (with slight changes) until 1874. Freetown, incorporated as a municipality in 1893, became the nation's capital in 1961.

Freetown's excellent natural harbour (an important World War II naval base) has deep-water docking facilities at the Queen Elizabeth II Quay. Its exports include palm oil and kernels, cocoa, coffee, ginger, and kola nuts. The city is the nation's commercial and transportation centre; industrial enterprises are limited and include diamond cutting, confectionary, paint and shoe enterprises, rice milling, and fish packing. Construction of the Guma Dam has solved Freeport's longtime water problem and provided more electrical power. Hastings Airfield (10 miles [16 km] southeast) handles domestic flights; the international airport at Lungi is across the Sierra Leone River.

Freetown is the site of Fourah Bay College on Mount Aurcol (founded 1827, part of the University of Sierra Leone, 1966), Njala University College (1964), the Milton Margai Teachers College at nearby Goderich (1960), a teachers college, a technical institute, and several government and Christian and Muslim secondary schools. There are several mosques and churches, notably the Anglican St. George's Cathedral (1828). The National Museum contains historical documents and traditional wood and stone sculptures. Much damage was done to the city and its inhabitants during a brutal civil war in the 1990s. Pop. (2001 est.) urban agglom., 837,000.

freezing, in food processing, method of preserving food by lowering the temperature to inhibit microorganism growth. The method has been used for centuries in cold regions, and a patent was issued in Britain as early as 1842 for freezing food by immersion in an ice and salt brine. It was not, however, until the advent of mechanical refrigeration that the process became widely applicable commercially. In 1880 a cargo of meat shipped from Australia to Britain under refrigeration accidentally froze, with such good results that the process was at once adopted for long-distance shipments and other storage. In the 20th century quick, or flash, freezing was found to be especially effective with certain types of food.

Except for beef and venison, which benefit from an aging process, meat is frozen as promptly as possible after slaughter, with best results at temperatures of 0° F (−18° C) or lower. Fruits are frozen in a syrup or dry-sugar pack to exclude air and prevent both oxidation and desiccation.

Most commercial freezing is done either in cold air kept in motion by fans (blast freezing) or by placing the foodstuffs in packages or metal trays on refrigerated surfaces (contact freezing).

For freeze-drying, see dehydration.

freezing nucleus, any particle that, when present in a mass of supercooled water, will

Freesia
W.H. Hodge

scented flowers in white, yellow, orange, and blue. The approximately 60-centimetre- (2-foot-) tall flower spikes usually turn at right angles from the stem, displaying the flowers in a horizontal line.

Two species much used in hybridization are *F. refracta*, greenish yellow to yellow or white, and *F. armstrongii*, tinged rose-purple. The plants are grown indoors in pots or in gardens in mild climates.

freestyle wrestling, one of three styles of wrestling used in international amateur competition (the others are Greco-Roman wrestling and sambo) under supervision of the Fédération Internationale de Lutte Amateur (International Amateur Wrestling Federation). It was derived from the English Lancashire, or catch-as-catch-can, style, in which nearly all holds were permitted. Freestyle wrestling is also an Olympic event.

Under international rules any fair hold, trip, or throw is permitted. Any hold that endangers life or limb is illegal—strangleholds, for example, are forbidden, as well as kicking, punching, butting with the head, and holding the clothing. Wrestlers are cautioned for irregularities, and three cautions mean disqualification. For a serious offense, a wrestler may be disqualified immediately.

Bouts are held on a mat at least 9 m (29.5

induce growth of an ice crystal about itself; most ice crystals in the atmosphere are thought to form on freezing nuclei. See condensation nucleus.

freezing point, temperature at which a liquid becomes a solid. As with the melting point, increased pressure usually raises the freezing point. The freezing point is lower than the melting point in the case of mixtures and for certain organic compounds such as fats. As a mixture freezes, the solid that forms first usually has a composition different from that of the liquid, and formation of the solid changes the composition of the remaining liquid, usually in a way that steadily lowers the freezing point. This principle is used in purifying mixtures, successive melting and freezing gradually separating the components. The heat of fusion (see thermal fusion), the heat that must be applied to melt a solid, must be removed from the liquid to freeze it. Some liquids can be supercooled—i.e., cooled below the freezing point—without solid crystals forming. Putting a seed crystal into a supercooled liquid triggers freezing, whereupon the release of the heat of fusion raises the temperature rapidly to the freezing point.

The addition of one mole (molecular weight in grams) of any non-ionic (does not form ions) solute to 1,000 grams of water lowers the freezing point of the water by 1.885° C, and this has been used as an accurate method for determining molecular weights.

Frege, (Friedrich Ludwig) Gottlob (b. Nov. 8, 1848, Wismar, Mecklenburg-Schwerin—d. July 26, 1925, Bad Kleinen, Ger.), German mathematician and logician, who

Frege

By courtesy of the Universitätsbibliothek Jena, E. Ger

founded modern mathematical logic. Working on the borderline between philosophy and mathematics—viz., in the philosophy of mathematics and mathematical logic (in which no intellectual precedents existed)—Frege discovered, on his own, the fundamental ideas that have made possible the whole modern development of logic and thereby invented an entire discipline.

Frege was the son of Alexander Frege, a principal of a girls' high school in Wismar. His mother, Auguste Frege, née Bialloblotzky, who was perhaps of Polish origin, outlived her husband, who died in 1866. Frege entered the University of Jena in 1869, where he studied for two years, and then went to the University of Göttingen for a further two—in mathematics, physics, chemistry, and philosophy. Frege spent the whole of his working life as a teacher of mathematics at Jena; he became a *Privatdozent* in May 1871, was made an *ausserordentlicher Professor* (associate professor) in July 1879, and became statutory professor of

mathematics in May 1896. He lectured in all branches of mathematics (though his mathematical publications outside the field of logic are extremely few) and also on his own logical system. A great many of his publications, however, were expressly philosophical in character: he himself once said, "Every good mathematician is at least half a philosopher, and every good philosopher at least half a mathematician." He kept aloof from his students and even more aloof from his colleagues.

Though Frege was married, his wife died during World War I, leaving him no children of his own. There was an adopted son, Alfred, however, who became an engineer.

Frege was, in religion, a liberal Lutheran and, in politics, a reactionary. He had a great love for the monarchy and for the royal house of Mecklenburg, and during World War I he developed an intense hatred of socialism and of democracy, to which he came to ascribe the loss of the war and the shame of the Treaty of Versailles. A diary kept at the end of his life reveals, as well, a loathing of the French and of Catholics and an anti-Semitism extending to a belief that the Jews must be expelled from Germany.

Frege had a vivid awareness of his own genius and a belief that it would one day be recognized; but he became increasingly embittered at the failure of scholars to recognize it during his lifetime. He delighted in controversy and polemic; but the originality of his own work, the almost total independence of his own ideas from other influences, past or present, was quite exceptional and, indeed, astonishing.

System of mathematical logic. In 1879 Frege published his *Begriffsschrift* ("Concept-script"), in which, for the first time, a system of mathematical logic in the modern sense was presented. No one at the time, however—philosopher or mathematician—comprehended clearly what Frege had done, and when, some decades later, the subject began to get under way, his ideas reached others mostly as filtered through the minds of other men, such as Peano; in his lifetime there were very few—one was Bertrand Russell—to give Frege the credit due to him. He was not yet too downcast by the failure of the learned world to appreciate the *Begriffsschrift*, which, after all, discourages the reader by the use of a complex and unfamiliar symbolism to express unfamiliar ideas. He resolved, however, to compose his next book without the use of any symbols at all.

There followed a period of intensive work on the philosophy of logic and of mathematics, embodied initially in his first book, *Die Grundlagen der Arithmetik* (1884; *The Foundations of Arithmetic*). The *Grundlagen* was a work that must on any count stand as a masterpiece of philosophical writing. The only review that the book received, however, was a devastatingly hostile one by Georg Cantor, the mathematician whose ideas were the closest to Frege's, who had not bothered to understand Frege's book before subjecting it to totally unmerited scorn.

Wounded by the reception of his second book, Frege nevertheless devoted the next decade to producing a series of brilliant philosophical articles in which he elaborated his philosophy of logic. These articles contain many deep insights, although, as Frege systematized his theories, there appeared a certain hardening into a kind of scholasticism. There followed a return to the philosophy of mathematics with the first volume of *Grundgesetze der Arithmetik* (1893; partial Eng. trans., *Basic Laws of Arithmetic*), in which Frege presented, in a modified version of the symbolic system of the *Begriffsschrift*, a rigorous development of the theory of *Grundlagen*. This, too, received only a single review (by Peano). The neglect of what was to have been his chief

d'oeuvre finally embittered Frege, who had complained, in the preface, of the apparent ignorance of his work on the part of writers working in allied fields. The resulting bitterness shows in the style of Frege's controversial writing. Seldom has criticism of previous writers been more deadly than in his *Grundlagen*; but it is never unfair. In volume 2 of the *Grundgesetze* (1903), however, the attacks became heavyhanded and abusive—a means of getting back at the world that had ignored him.

Contradictions in Frege's system. A worse disaster than neglect, however, was in store for him. While volume 2 of the *Grundgesetze* was at the printer's, he received on June 16, 1902, a letter from one of the few contemporaries who had read and admired his works—Bertrand Russell. The latter pointed out, modestly but correctly, the possibility of deriving a contradiction in Frege's logical system—the celebrated Russell paradox. The two exchanged many letters; and, before the book was published, Frege had devised a modification of one of his axioms intended to restore consistency to the system. This he explained in an appendix to the book. After Frege's death, it would be shown by a Polish logician, Stanislaw Lesniewski, that Frege's modified axiom still leads to contradiction. Probably Frege never discovered this. Even a brief inspection, however, of the proofs of the theorems in volume 1 would have revealed that several crucial proofs would no longer go through, and this Frege must have found out.

In any case, 1903 effectively marks the end of Frege's productive life. He never published the projected third volume of the *Grundgesetze*, and he took no part in the development of the subject, mathematical logic, that he had founded, though it had progressed considerably by the time of his death. He published a few polemical pieces; but, with the exception of three essays in the philosophy of logic produced after the end of the war, he did no further creative work. In 1912 he declined, in terms expressing deep depression, an invitation by Russell to address a mathematical congress in Cambridge.

At the very end of Frege's life, he again started to work on the philosophy of mathematics, having arrived at the conclusion that one of the fundamental bases of his earlier work—the attempt to found arithmetic on logic—had been mistaken; but the work did not progress very far and was not published.

Up to an advanced age, Frege hiked every summer in Mecklenburg, his native region. He finally retired during World War I and went to live in Bad Kleinen, in Mecklenburg.

Influence of Frege's work. Frege's work represents the beginning of modern logic because of his invention of the notation of quantifiers and variables. (In natural language, generality is represented by inserting an expression like "everything" or "something" in the argument-place of the predicate; in the notation used in logic since Frege, the argument-place is filled by a variable letter, say x , and the resulting expression prefixed by a quantifier, "For every x " or "For some x ," said to "bind" that variable.) By means of this notation he solved the problem that had baffled the logicians of the Middle Ages and prevented the further advance of logic ever since, viz., the analysis of sentences involving multiple generality. In him there also appeared the first clear separation between the formal characterization of logical laws and their semantic justification. His philosophical work is of an importance far more general than the area to which he principally applied it, the philosophy of mathematics; he initiated a revolution, in fact, as profound as that of René Descartes in the 17th century. Whereas Descartes had made epistemology the starting point for all

philosophy, Frege gave this place to the theory of meaning or the philosophy of language. His work has been influential because he made the restricted part of philosophy in which he worked basic to all the rest. The effect was imparted in the first place, however, through the work of others, particularly that of Wittgenstein, who visited him in 1914 and who revered him. But, since John Austin's translation of the *Grundlagen* into English in 1950, the direct influence of Frege's writing among English-speaking philosophers has been very great. No one supposes that Frege said the last word on any topic; but there is scarcely a live question in contemporary philosophy of language for whose examination Frege's views do not form at least the best starting point.

(Mi.D.)

BIBLIOGRAPHY. *Works.* The principal English translations of Frege's works are: J.L. Austin (trans.), *The Foundations of Arithmetic: A Logico-Mathematical Enquiry into the Concept of Number*, 2nd ed. rev. (1959), a two-language version; Peter Geach and Max Black (eds.), *Translations from the Philosophical Writings of Gottlob Frege*, 2nd ed. (1960); Montgomery Furth (ed. and trans.), *The Basic Laws of Arithmetic* (1964); J. van Heijenoort (ed. and trans.), "Begriffsschrift," in *From Frege to Gödel* (1967); and A. and M. Quinton (trans.), "The Thought," in Peter F. Strawson (ed.), *Philosophical Logic* (1967).

Critical sources. E.D. Klemke (ed.), *Essays on Frege* (1968), contains recent work on Frege. See also Ludwig Wittgenstein, *Tractatus Logico-philosophicus* (1922; Eng. trans. 1961) and *Philosophische Untersuchungen* (written 1936-49; *Philosophical Investigations*, 1953); Bertrand Russell, "On Denoting," *Mind*, 14:479-493 (1905, reprinted in *Logic and Knowledge*, ed. by R.C. Marsh, 1956); and Michael Dummett, "Frege, Gottlob," *Encyclopedia of Philosophy*, vol. 3 (1967) and *The Interpretation of Frege's Philosophy* (1980).

Frei (Montalva), Eduardo (b. Jan. 16, 1911, Santiago, Chile—d. Jan. 22, 1982, Santiago), Chilean politician and the first Christian Democratic president of Chile (1964-70).

Frei graduated in law in 1933 from the Catholic University of Chile, where he had been president of the National Association of Catholic Students in 1932-33. He served as a delegate to the Congress of Catholic Young People held in Rome in 1934 and helped organize a youth department within the Chilean Conservative Party in 1935. Until 1937 he was the editor of the daily *El Tarapaca* of the seaport town of Iquique, in which he opposed Marxism. In 1938, disillusioned with the Conservative Party, he joined other youth department leaders to form the National Falange, an anti-fascist social Christian party. While a professor of labour law at the Catholic University in 1940-45, he was elected president of the Falange in 1941, 1943, and 1945. He served as an innovative and highly competent minister of public works in the coalition cabinets of presidents José Antonio Ríos in 1945-46 and Gabriel González Videla in 1946-49. In 1949 he was elected to the Senate.

In 1957 the Falange joined with the Social Christian Conservatives to form the Christian Democratic Party, which drew its inspiration from the French Catholic philosopher Jacques Maritain and European Christian Democratic movements. Frei placed third as the party's presidential candidate in 1958, as the party showed increasing strength at the expense of the Conservatives, and by 1964 his presidential candidacy appeared to be the only effective alternative to Marxism. While Salvador Allende, the candidate of the leftist coalition, called for nationalization, Frei offered a moderate program of "Chileanization" of U.S.-owned copper interests as well as economic stabilization and a more equitable distribution of wealth. He won a decisive victory and in 1965 also won control of the lower house of Congress. Although he raised expectations of major change, he achieved only mixed success

as president. His plan for 51 percent Chilean control of copper mining was thought to be still too favourable to U.S. corporate interests. His administration was harassed by labour unrest and persistent inflation. His agrarian-reform policies did not achieve expected objectives, nor did the Christian Democratic notion of public participation through "Communitarianism" succeed. Marked progress was made, however, in expanding educational opportunities for the impoverished. Unable to succeed himself, he retired in 1970. Frei wrote many articles and several books on economics and political subjects.

Frei test, procedure used in the diagnosis of lymphogranuloma venereum, a venereal disease caused by a virus. The yolk of a chick embryo is infected with the virus, which is then inactivated by heat. A small amount of this commercial preparation is injected into the skin of the forearm. In a positive reaction, which indicates that the person tested has, or has had, the disease, an inflammatory nodule at least 6 millimetres (about 1/4 inch) in diameter with reddened skin around is usually present at the end of 48 hours.

Freiberg, city, Saxony *Land* (state), eastern Germany, on the Freiburger Mulde River, at the northeastern foot of the Erzgebirge (Ore Mountains), southwest of Dresden. An early influential silver-mining community (founded c. 1190 and chartered early in the 13th century) and the source (1296-1307) of a mining code (*Freiberger Stadtrecht*), its name is derived from the extensive mining rights that then belonged to the "free miner." Until the 16th century it was the largest city, economic centre, and mint of Saxony. The Reformation was introduced there in 1536 by Henry the Pious, then a resident. The town suffered severely in the 17th century during the Thirty Years' War and again during the French occupation from 1806 to 1814. The Altstadt (Old City) has three separate parts: the oldest, the Civitas Saxonum, a maze of alleys around the Nikolai (St. Nicholas) church; the Untermarkt (Lower Market), a merchant district with the modern cathedral at its centre; the Oberstadt (Upper City), with the town hall and St. Peter's Church as its notable landmarks. Medieval buildings include the town hall (1410-16); Freudenstein Castle (rebuilt 1566-79); the cathedral (1484-1501) with the noted Goldene Pforte (1230; Golden Portal) from an earlier church; and parts of the old town wall, notably, Donats Turm (Donat Tower). The geologists Clemens A. Winkler and Abraham G. Werner taught at the town's renowned Freiberg School of Mining (opened 1765, the oldest of its kind in the world). There are also institutes for radium, nonferrous metals, fuel, and leather.

The silver mines were abandoned as unproductive in 1913, and the other mines (lead, pyrites, zinc) became public property in 1936. In addition to mining there are manufactures of machinery, electrical and precision instruments, leather, textiles, and porcelain. Pop. (1989 est.) 51,341.

Freiburg, *Regierungsbezirk* (administrative district), southwestern Baden-Württemberg *Land* (state), southwestern Germany. Freiburg is bordered by Switzerland to the south, France to the west, and the *Regierungsbezirke* of Karlsruhe to the north and Tübingen to the east. The district occupies an area of 3,613 sq mi (9,357 sq km) and is coextensive with the southern portion of the larger historic region of Baden (q.v.).

The title margrave of Baden originated in 1112. Baden was made a grand duchy in Napoleon's reorganization of Germany in 1806

and a *Land* of the German Reich under the constitution of 1919. Three post-World War II states of West Germany—Baden, Württemberg-Baden, and Württemberg-Hohenzollern—were merged in 1952 to form the present state of Baden-Württemberg. Southern Baden, roughly encompassing the current district of Freiburg, became the new *Land*'s southwestern *Regierungsbezirk* of Südbaden. In 1973 an administrative reform altered the boundaries of Südbaden and changed its name to Freiburg, after the largest city and administrative seat of the district.

The southern Schwarzwald (Black Forest), the heart of Germany's largest continuous forest area and source of the Danube and Neckar rivers, occupies nearly all of Freiburg. Dense fir forests that give the region its name lie on an undulating plateau of granite and gneiss topped with higher rounded hills. The plateau is broken by many river valleys including the deep Kinzig valley, the boundary between the northern and southern Black Forest. In western Freiburg the plateau rises some 2,600 ft (800 m) in a steep scarp from the fertile Upper Rhine Plain. The forest extends approximately 40 mi (60 km) in width before its more gentle eastern slopes meet the valleys of the upper Danube and Neckar rivers on the Baar plateau. The Schwabische Alb (Swabian Jura) borders the Baar to the east. The highest peak in the Black Forest, the Feldberg, reaches 4,897 ft (1,493 m) in elevation in southwestern Freiburg and is surrounded by the beautiful Titisee and Schluchsee glacial lakes. Farmers specialize in livestock production in the higher districts of the Black Forest, where mountain pastures above the tree line are used for summer grazing and permanent pastureland is found in valley basins. Harsh climatic conditions limit arable cultivation to hardy cereals. Fruit is grown in valleys cutting into the western escarpment, most commonly grapes, plums, and cherries used in *kirschwasser*, a famous Black Forest cherry brandy.

Specialized industries comprise an important sector of the Black Forest economy. Lumbering is widely dispersed at valley sites where natural water power is available. Large wood-working industries such as furniture factories and paper mills, however, are generally located on the western fringes of the plateau, reducing transportation costs to market areas. The manufacture of modern clocks and precision and optical instruments has grown from the traditional wood-carving and cuckoo clock industries. Well-known clock factories are located in Schramberg, Villingen, and Schwenningen. Trossingen is famous for its organs and accordions. The textile industry has spread into southern villages from Switzerland, and tourism continues to grow. Numerous health spas and year-round holiday resorts have made the Black Forest one of Europe's most visited tourist areas. Freiburg im Breisgau, situated on the western slopes, is the economic and cultural centre of the Black Forest and has a flourishing tourist trade. The city produces electrical equipment and chemicals and is an important timber and wine trade centre.

West of the Black Forest the mild climate and fertile loess soils of the Upper Rhine Plain's Ortenau and Breisgau regions favour intensive cultivation. Many farmers specialise in vegetable gardening and in crops such as tobacco, sugar beets, hops, and malting barley, in addition to vineyards and orchards. Offenburg is the principal city of the Ortenau wine and fruit-growing district and a publishing centre. Vineyards around the volcanic Kaiserstuhl mountain and in the Markgräfler Land at the Black Forest's southwestern termination produce some of Germany's finest wines. The Dinkelberg and Hotzenwald

border the Rhine River in southern Freiburg, and in the southeast the Hegau region with its volcanic cones extends to the Bodensee (Lake Constance), Germany's largest lake. The economy of Konstanz, the chief town on the lake, is based on tourism, commerce, and electrical, textile, and metal-processing industries.

The majority of the population of Freiburg are descendants of the Alemanni, a Suebic people who occupied the territory from the 3rd century AD. The predominant language of the district is the Alemannic dialect, merging into Swabian in the east. In the Black Forest isolated farmsteads and small hamlets are the dominant forms of rural settlement. The population is predominantly Roman Catholic. Pop. (1989 est.) 1,896,377.

Freiburg (Switzerland): see Fribourg.

Freiburg, Albert Ludwig University of, German in full ALBERT-LUDWIGS-UNIVERSITÄT FREIBURG IM BREISGAU, academically autonomous coeducational institution of higher learning at Freiburg im Breisgau, Ger., financially supported by the state of Baden-Württemberg. Founded in 1457 by Archduke Albrecht of Austria and confirmed by the Holy Roman emperor and the pope, the university was at first named after its founder, but at the beginning of the 19th century added "Ludwig" to the name in honour of its patron, Archduke Ludwig of Baden. Beginning in 1620 Jesuits took over its teaching in philosophy and the chief theological chairs. When Freiburg was ceded to Louis XIV of France in 1677, the university fled to Constance, Switz. Reestablished in Freiburg early in the following century, it developed into a centre for the Catholic Enlightenment in south Germany. Becoming a state institution, it gained fame for its instruction in law. The modern university includes faculties of theology, law, medicine, economics, philosophy, mathematics, the sciences, and forestry.

Freiburg im Breisgau, city, Baden-Württemberg *Land* (state), southwestern Germany. It is picturesquely situated on the western slopes of the Black Forest, where the Dreisam River flows into the Rhine valley. It was founded and chartered in 1120 by the dukes of Zähringen as a free market town (hence its name). In 1218 it passed to the counts of Urach, who assumed the title of counts of Freiburg. Under the Habsburgs after 1368, it was the administrative centre for the outly-

ing Austrian possessions from 1648 to 1805. It was captured in 1525 by the Bauernbund (Peasants' and Farmers' League); in 1632 and 1638 by the Swedes; during the Thirty Years' War (1644) by the Bavarians; and in 1677, 1713, and later by the French, who fortified it. In 1806 it was returned, together with the Breisgau and Ortenau areas, to the ruling house of Baden. Almost all of the old part (the medieval *Innenstadt*) of the city was completely destroyed by Allied bombing during World War II.

The administrative area of the city covers about 31 square miles (80 square km), only about a quarter of which is residential, the remainder comprising oak and pine forests, farmland, and parkland. The Basler Hof, the former residence of the chapter of Basel Cathedral, now houses the city's administrative offices. The Münster, begun in the 13th century and the seat (since 1827) of a Roman Catholic archbishopric, was the only German cathedral to be completed in the Gothic style between the 12th and 16th centuries; its 370-foot (113-metre) tower, its richly decorated main entrance, and the triptych by Hans Baldung Grien on the high altar are particularly noteworthy. Other interesting buildings include the Franciscan Church of St. Martin (dating from the 13th century), the 16th-century town hall, the Jesuit church (1685–1701), and the 18th-century Wenzingerhaus, now the state college of music. The Albert Ludwig University of Freiburg was founded in 1457 by Albrecht VI. The Augustiner Museum contains valuable works of medieval and Baroque art from the upper Rhine district. There are also museums of natural science, folklore, and prehistory.

The cultural and economic centre of the Black Forest, Freiburg is a tourist and conference centre with an important trade in timber and wine. Pop. (1989 est.) 183,979.

Freidank (fl. early 13th century), German didactic poet whose work became regarded as a standard repository of moral precepts.

The poet was a wandering minstrel of burgher origin, born probably in Alemannic or Swabian territory. He took part in the crusade of Frederick II in 1228–29. Several of the impressions left by these experiences are recorded in the one work by which he is known, *Bescheidenheit* ("Moderation"), a collection of gnomic verse, which seems to have been written about 1230. The fables, proverbs, and other sources on which Freidank drew were common property. His achievement lay in the formulation of aphorisms that have the authority of proverbs.

Freie Bühne (German: "Free Stage"), independent theatre founded by the critic and director Otto Brahm in 1889 in Berlin for the purpose of staging new, naturalistic plays. Like André Antoine's Théâtre-Libre in Paris, Brahm gave private performances to theatre subscribers only. The Freie Bühne's first production was of Henrik Ibsen's *Gengangere* (1881; *Ghosts*) in September 1889. A month later, Brahm staged Gerhart Hauptmann's first play, *Vor Sonnenaufgang* (1889; *Before Dawn*), a tragedy of working-class people. During the following seasons, Brahm's presentations included the important naturalist drama dealing with a degenerate family, *Die Familie selicke* (1890; "The Happy Family") by Arno Holz, as well as plays by Leo Tolstoy, Émile Zola, and August Strindberg. Although the Freie Bühne was a success, it lasted for only three seasons, largely because Berlin's commercial theatre had by then embraced the new theatrical movement of naturalism. But it inspired the creation of other private theatres and amateur groups throughout Berlin, Munich, and Vienna.

freight car, also called GOODS WAGGON, railroad car designed to carry cargo. Early freight cars were made largely of wood. All-steel cars

were introduced by about 1896 and within 30 years had almost completely replaced the wooden variety. Modern freight cars vary widely in shape and size, but virtually all of them evolved from three basic types that had been in use since the early 1800s: the open-top car, the boxcar, and the flatcar.

Open-top cars may be either gondola or hopper cars. Hoppers are used to haul bulk freight such as coal, gravel, and grain; they have either several discharge hatches or a collapsible bottom for rapid unloading. Gondola cars have fixed bottoms and must be unloaded from above with the help of a crane; they are used to transport manufactured goods. Boxcars are enclosed cars with sliding doors on the sides; they serve to transport manufactured goods requiring protection from the weather and pilferage. Certain types of boxcars, known as refrigerator cars, are heavily insulated and specially cooled to convey fresh or frozen foods over long distances. Another variation of the common boxcar is the stock car with slatted sides, which is used to transport cattle, sheep, and other livestock. The flatcar has long been utilized for hauling heavy construction machinery and military equipment. During the 1950s British Railways and various other European railroad companies developed high-capacity flatcars suitable for carrying huge demountable containers filled with a variety of cargoes and standardized for use on container ships and flatbed trailers as well. About the same time, American railroads introduced the piggyback car, a flatcar modified to hold as many as two truck trailers in place. Later piggyback-car designs utilized double-stacked trailers on interconnected flatcars. The two-level and three-level rack cars widely used in the United States and Canada for conveying new automobiles are also examples of redesigned flatcars. A similar innovation is the transporter wagon, or car van, employed by some continental European and American passenger trains to haul the automobiles of touring motorists who wish to travel part way by rail. One other specialized freight car is the cylindrically shaped tank car constructed to carry a variety of liquids, including industrial chemicals.

Freikorps, English FREE CORPS, any of several private paramilitary groups that first appeared in December 1918 in the wake of Germany's defeat in World War I. Composed of ex-soldiers, unemployed youth, and other discontents and led by ex-officers and other former military personnel, they proliferated all over Germany in the spring and summer of 1919 and eventually numbered more than 65 corps of various names, sizes, and descriptions. Most were nationalistic and radically conservative and were employed unofficially but effectively to put down left-wing revolts and uprisings in Berlin, Bremen, Brunswick, Hamburg, Halle, Leipzig, Silesia, Thuringia, and the Ruhr; they fought miniature wars and sometimes resorted to plunder and roughhousing. At first sanctioned, or even supported, by such figures as Defense Minister Gustav Noske and General Paul von Hindenburg, the Freikorps finally came to be viewed as a nuisance and a threat, and their activities were eventually supplanted by regular army and police work or assumed by the new units of the Nazis and other political parties. Ernst Röhm, a Freikorps commander, later became head of the Nazi SA, or Brownshirts.

Freiligrath, (Hermann) Ferdinand (b. June 17, 1810, Detmold, Westphalia [Germany]—d. March 18, 1876, Cannstatt, near Stuttgart, Ger.), one of the outstanding German political poets of the 19th century, whose verse gave poetic expression to radical sentiments.

After working as an accountant in a bank in Amsterdam (1831–39), Freiligrath abandoned commerce for literature with the success of his first poems, the Romantic *Gedichte* (1838;

Schwabentor (tower), Freiburg im Breisgau, Ger.

"Poems"). Influenced by Victor Hugo, these early poems are characterized by vividly imaginative and evocative exotic scenes and technical virtuosity; they won him a pension from the Prussian king Frederick William IV.

Freiligrath's views became increasingly radical, however, and in 1844 he renounced the pension upon the publication of his collection of political poems *Glaubensbekenntnis* (1844; "Statement of Conscience"). His poetry was banned, and he was forced to leave Germany for Belgium and Switzerland and then England. His poems in *Ca ira* (1846; "This Will Be") and *Neuere politische und soziale Gedichte* (1849 and 1851; "Newer Political and Social Poetry"), celebrating the Revolution of 1848, which brought him back to Germany, were even more strongly socialistic and antimonarchical; they are considered to be among the best examples of German revolutionary poetry of the time. The poem *Die Toten an die Lebenden* (1848; "From the Dead to the Living") resulted in his arrest for subversion, but he was acquitted. He moved to Cologne, where he formed a long-standing friendship with Karl Marx, with whom he edited the *Neue rheinische Zeitung* ("New Rhenish Newspaper"). In 1851 he returned to England to escape further political persecution. He was the London manager of the General Bank of Switzerland from 1856 to 1865. In 1868 a public subscription raised in Germany enabled him to return.

Among Freiligrath's other important works are his translations of the social poetry of William Wordsworth, Henry Wadsworth Longfellow, Walt Whitman, Robert Burns, Victor Hugo, and Molière.

Freising, city, Bavaria *Land* (state), southern Germany. It lies along the Isar River, north-northeast of Munich. It was the site of a castle in the 8th century, and, after the missionary bishop Korbinian came there in 724 and St. Boniface established the bishopric in 739, it became the ecclesiastical and cultural centre of old Bavaria. The bishopric was secularized in 1803, later reconstituted, and transferred to Munich in 1821. The city is dominated by the Domberg ("Cathedral Hill") with its cathedral (1160–1205), St. John's Church (1319–21), and the Benedict Church (c. 1160, altered 1716). Freising's other notable buildings

Domberg ("Cathedral Hill") with the cathedral along the Isar River, Freising, Ger.

D.H. Teuffen—ZEFA

include St. George's Church (c. 1440), the former Benedictine abbey of Weihestephan (now a college of agriculture and brewing), the abbey brewery (licensed since 1146, one of the oldest in the world), and the former bishops' palace. Besides brewing, Freising's industries include the manufacture of electrical machinery and textiles. Pop. (1993 est.) 38,928.

Freistadt, town, Oberösterreich *Bundesland* (federal state), north-central Austria, near the Czech Republic frontier. First mentioned in 1241, it is an old fortified town on the ancient iron- and salt-trade route connecting the Danube River and Bohemia. The town is

ringed with fortifications, double walls, moats, towers, and gates that are still largely intact. The town centre is an unspoiled ensemble of old town houses and public buildings in Gothic style, notably the Church of Our Dear Lady, with Gothic murals and windows. Pop. (1991) 6,917.

Fréjus, town, Var *département*, Provence-Alpes-Côte-d'Azur *région*, southeastern France. It lies south of the Estérel Massif, southwest of Cannes. The town is on the site of an ancient naval base founded by Julius Caesar about 50 BC and known originally as Forum Julii. Its Roman ruins include a 3rd-century amphitheatre, an aqueduct, and ancient fortifications. The Cathedral of Notre-Dame et Saint-Étienne (13th century) has a 5th-century baptistery. Fréjus was the birth-

Fréjus, France, and its beach on the Côte d'Azur (French Riviera)

Club Ins

place of the Roman poet Gaius Cornelius Gallus and of the French revolutionary statesman Emmanuel-Joseph Sieyès (1748). The town was devastated by flood when the nearby Malpasset Dam collapsed in 1959. The town's economic activities include tourism, the production of wines and fruits (especially peaches), and the quarrying of fluorspar and barite (barium sulfate). Pop. (1990) 42,613.

Freleng, Friz, original name ISADORE FRELING, also called I. FRELING (b. Aug. 21, 1906, Kansas City, Mo., U.S.—d. May 26, 1995, Los Angeles, Calif.), American animator of motion pictures noted for having produced and directed more than 300 cartoons, primarily for the Looney Tunes and Merrie Melodies film series at Warner Brothers.

Freleng joined Warner Brothers as head animator in 1930, after working for Armour Packing and, briefly, for United Film Ad Service, Walt Disney, and another animation company. He became a full-time director in 1933, mastering the synchronization of movement with music for the Looney Tunes and Merrie Melodies series. For the series, which was originally designed to market the studio's music portfolio, he created or redesigned the characters known as Porky Pig, Yosemite Sam, Sylvester the Cat, and Tweety Pie (a canary). He won four Academy Awards for his cartoons at Warner Brothers. He also created the Pink Panther and won his fifth Academy Award for *The Pink Panther* (1964), the original of that series. In 1963 he cofounded DePatie-Freleng Enterprises, for which he directed television and theatrical films.

Frelimo, in full FRENTE DE LIBERTAÇÃO DE MOÇAMBIQUE, English MOZAMBIQUE LIBERATION FRONT, political and military movement that initiated Mozambican independence from Portugal and then formed the governing party of newly independent Mozambique in 1975.

Frelimo was formed in neighbouring Tanzania in 1962 by exiled Africans from Mozambique who were seeking to overthrow

Portuguese colonial rule in their country. The movement's original leader was Eduardo Mondlane; he held the nascent organization together, obtained support from both communist and western European countries, and built a force of several thousand guerrillas who became active in northern Mozambique. Mondlane was assassinated in 1969 and was succeeded by Samora Machel, a pragmatic military commander who extended Frelimo's activities to central Mozambique. By the mid-1960s the Portuguese colonial authorities had 70,000 troops in Mozambique to put down the insurgency, but to no avail. Following the left-wing military coup in Portugal in

1974, Mozambique attained independence in 1975 under a Frelimo government headed by Machel. Frelimo subsequently restructured itself as a Marxist-Leninist party and tried to revive the country's shattered economy, but its efforts were hampered by its commitment to collective agriculture and by the destructive activities of the dissident Mozambican group known as Renamo (*q.v.*). Frelimo and Renamo signed a peace accord in 1992, and Frelimo won multiparty elections held in Mozambique in 1994.

Frelinghuysen, Frederick Theodore (b. Aug. 4, 1817, Millstone, N.J., U.S.—d. May 20, 1885, Newark, N.J.), lawyer and U.S. senator who as secretary of state obtained Pearl Harbor in Hawaii as a U.S. naval base.

Frelinghuysen was born into a family that had long been prominent in politics. Left an orphan at the age of three, he was adopted by his uncle, Theodore Frelinghuysen. He graduated from Rutgers College in 1836, studied law in his uncle's law office, and succeeded to the latter's large practice in 1839. Frelinghuysen was one of the founders of the Republican Party in New Jersey and served as the state's attorney general from 1861 to 1866.

In 1866 he was appointed to the U.S. Senate to fill a vacancy and was elected the following year to fill the unexpired term. Defeated for the Senate in 1869, he was elected for a full six-year term beginning in 1871. President Chester A. Arthur appointed Frelinghuysen secretary of state in 1881 to succeed James G. Blaine. Patient and firm in his handling of diplomatic affairs, he favoured closer commercial relations with Latin America and negotiated a change in the treaty with Hawaii to secure a U.S. naval base at Pearl Harbor. He also opened treaty relations with Korea (1882) and mediated several international disputes.

Fremantle, city and principal port of Western Australia, on the Indian Ocean at the mouth of the Swan River (which forms an inner harbour). Now part of the Perth metropolitan

area, Fremantle is one of Australia's largest ports and an initial landfall for ships from Europe. It was laid out in 1829 and named after Captain Sir Charles Fremantle, a British naval officer who took possession of the area around the river mouth in order to prevent French or U.S. incursions there. Not subject to fog, storms, or strong tides, the port became a major whaling centre. It grew during the late 19th century by serving the Coolgardie-Kalgoorlie goldfield (320 miles [515 km] inland), and, in 1901, with harbour improvements, it surpassed the port of Albany, 230 miles (370 km) southeast, in importance. During World War II it served as the principal Allied submarine base in the Southern Hemisphere.

Fremantle, a city since 1929, is now a major industrial centre manufacturing superphosphate fertilizer, furniture, refined sugar, scoured wool, leather, ships, steel, automobiles, cement, petroleum products, and aluminum. A terminus of the Trans-Australian Railway, Fremantle is also linked by rail to the state's chief agricultural areas. Exports include petroleum, grains, flour, wool, mineral concentrates, and refrigerated meats. The large industrial complex of Kwinana is nearby. The outer harbour is 73 square miles (190 square km) in extent, while the inner harbour (in the mouth of the Swan River), opened in 1897, was expanded in 1969 with a container terminal employing one of the world's largest container-lifting cranes. Fremantle is the base for the state's largest commercial fishing fleet. Pop. (1986) 23,540.

Fremont, city, Alameda county, California, U.S., on the southeast shore of San Francisco Bay (there spanned by the Dumbarton Bridge), on the Hetch Hetchy Aqueduct. Site of Mission San José de Guadalupe (founded in 1797), the city, named for John C. Frémont, the Western explorer, was formed in 1956 through the amalgamation of five communities—Centerville, Irvington, Niles, Mission San José, and Warm Springs. Freeway connections stimulated residential and industrial growth as part of the San Francisco Bay development. Ohlone (junior) College (1965) is in Fremont. Pop. (1990) 173,339.

Frémont, John C(harles) (b. Jan. 21, 1813, Savannah, Ga., U.S.—d. July 13, 1890, New York, N.Y.), American mapmaker and explorer of the Far West, an important figure in the U.S. conquest and development of California. He ran unsuccessfully as the first Republican presidential candidate in 1856.

In 1838 Frémont assisted the French scientist Jean-Nicolas Nicollet in surveying and mapping the upper Mississippi and Missouri rivers. He also headed an expedition (1841) to survey the Des Moines River for Nicollet, who had given him expert instruction in geology, topography, and astronomy. His growing taste for wilderness exploration was whetted

Frémont

By courtesy of the Library of Congress, Washington, D.C.

by the expansionist enthusiasm of Missouri senator Thomas Hart Benton, who became his adviser, sponsor, and, in 1841, father-in-law. Benton's influence in government enabled Frémont to accomplish within the next few years the mapping of much of the territory between the Mississippi valley and the Pacific Ocean. In 1842 the War Department sent him to survey the route west to Wyoming, and in 1843, accompanied by the colourful guide Kit Carson and mountain man Thomas Fitzpatrick, he completed a survey to the mouth of the Columbia River. After thoroughly exploring much of the Northwest, he made a winter crossing of the Sierra Nevada to California, further adding to his fame.

War with Mexico over the annexation of Texas seemed imminent, and in the spring of 1845 Frémont headed a third expedition west with possible secret instructions for action in case of war. Upon his arrival in California he defied Mexican authorities, throwing his support behind a small group of dissident Americans near Sonoma who started an unofficial uprising and created the Bear Flag Republic. When news of the declaration of war with Mexico (May 1846) reached California, Frémont was appointed by Commodore Robert F. Stockton as major of a battalion and, with Stockton, completed the conquest of the future 31st state. Meanwhile, General Stephen Watts Kearny entered California from the southeast with orders to establish a government, leading to an obvious conflict of authority. Frémont accepted California's capitulation from Mexican officials at Cahuenga Pass, near Los Angeles, and Stockton appointed him military governor of California. Kearny, however, had Frémont arrested and court-martialed in Washington, D.C., in 1847–48 for disobedience. He was sentenced to dismissal from the army, and although his penalty was set aside by President James K. Polk, Frémont resigned. Through it all, he retained the high regard of the general public.

Frémont became a multimillionaire in the 1848 California gold bonanza, and in 1850 he was elected one of the state's first two senators. A firm opponent of slavery, he was nominated for the presidency in 1856 by the new Republican Party. In the election he was defeated by the Democratic candidate, James Buchanan, but he came closer to uniting the electorate of the North and West against the South than had any previous candidate.

Frémont served unsuccessfully as a Union officer in the American Civil War, and he resigned from the army (1862) a second time. Still popular, he was considered for the presidential nomination again in 1864 but withdrew to avoid dividing the party. Thereafter he retired from public life to devote himself to railroad projects in the West. In 1878, after losing his fortune, he was appointed governor of the Arizona Territory, where he served until 1883.

BIBLIOGRAPHY. Biographies include Allan Nevins, *Frémont: Pathmarker of the West*, 2 vol. (1955, reissued 1962); and Ferol Egan, *Frémont, Explorer for a Restless Nation* (1977, reprinted 1985).

Frémy, Edmond (b. Feb. 28, 1814, Versailles, Fr.—d. Feb. 3, 1894, Paris), French chemist best known for his investigations of fluorine compounds. In 1831 he entered the laboratory of Joseph-Louis Gay-Lussac and, after holding several teaching posts, succeeded Gay-Lussac in the chemistry chair at the Museum of Natural History, Paris (1850), of which he became director (1879–91).

Frémy investigated osmic acid, ozone, and compounds of iron, tin, and lead, among others. He sought to isolate free fluorine and discovered hydrogen fluoride and a series of its salts. He studied the colouring matters of leaves and flowers and the composition of animal substances. He contributed to the

technology of iron, steel, sulfuric acid, glass, paper, and, in particular, the saponification of fats. He sought to obtain crystals of aluminum oxide and succeeded in making rubies.

French, Daniel Chester (b. April 20, 1850, Exeter, N.H., U.S.—d. Oct. 7, 1931, Stockbridge, Mass.), sculptor whose work is probably more familiar to a wider American audience than that of any other native sculptor.

Daniel Chester French, c. 1915

Peter A. Juley & Son

French's first important commission, which came from the town of Concord, Mass., was the statue "The Minute Man" (1875), commemorating the Concord fight 100 years earlier. It became the symbol for defense bonds, stamps, and posters of World War II. French's great marble, the seated Lincoln in the Lincoln Memorial, Washington, D.C., was dedicated in 1922. In the intervening 50 years he created a vast number of works on American subjects. Among these are the equestrian statues of General Ulysses S. Grant in Philadelphia and General George Washington in Paris; three pairs of bronze doors for the Boston Public Library; the "Standing Lincoln," Lincoln, Neb.; the statue of Ralph Waldo Emerson in the public library, Concord, Mass.; the "Alma Mater" at Columbia University; and the "Four Continents" at the New York City customhouse.

French, Free: see Free French.

French, Sir George Arthur (b. June 19, 1841, Roscommon, Ire.—d. July 28, 1921, London, Eng.), British soldier in Canada who organized the North West Mounted Rifles (later the North West Mounted Police, then Royal North West Mounted Police, now Royal Canadian Mounted Police).

French attended the Royal Military academies at Sandhurst and Woolwich and in 1860 obtained a commission in the Royal Artillery. In 1871 he went to Canada as an inspector of artillery. In 1873 he organized the North West Mounted Rifles and was its first commissioner; he commanded the march from Dufferin, Man., to the foothills of the Rockies in 1874, to establish law and order in the region. He was also head of the School of Gunnery at Kingston, Ont.

French resigned his post in Canada in 1876 and returned to serve in the British army, going first to Australia and then to India. He attained the rank of major general in 1900 and was knighted in 1902.

French, John (Denton Pinkstone), 1ST EARL OF YPRES, VISCOUNT FRENCH OF YPRES AND OF HIGH LAKE (b. Sept. 28, 1852, Ripple, Kent, Eng.—d. May 22, 1925, Deal, Kent), field marshal who commanded the British army on the Western Front between August 1914, when World War I began,

and Dec. 17, 1915, when he resigned under pressure and was succeeded by General (afterward Field Marshal) Douglas Haig.

The battles fought under his direction at Ypres, Belg., and elsewhere are remembered chiefly for inordinate numbers of British casualties—e.g., 110,000 dead in the first two battles of Ypres. He was considered unable to adapt himself to unfamiliar conditions of war or to work harmoniously with the British government, his own subordinates, or the French and Belgian generals with whom he was supposed to cooperate.

A soldier from 1874, French became a public figure with his successful leadership of British cavalry against the Boers in the South African War (1899–1902). He was appointed inspector general in 1907 and chief of the Imperial General Staff in 1913.

On Aug. 23, 1914, near Mons, Belg., French directed the first major engagement of British troops in the war. Although superior German strength forced him to retreat, he had intended merely to cover the withdrawal of the French 5th Army, and as a delaying action the battle was a success. He was criticized, however, for his failure to coordinate the movement of his two corps or even to remain in touch with their commanders. After a costly battle at Le Cateau, Fr., on August 26, he seemed to lose his nerve and planned to withdraw south of the Seine River and perhaps from France altogether. Lord Kitchener, the British secretary of state for war, induced him to remain in action and to work more closely with the French and Belgian armies.

On Oct. 19, 1914, French ordered his force, increased by that time to three corps, to start a two-branched offensive eastward from Ypres. The British collided with German armies that began an offensive of their own the next day. By November 22 the First Battle of Ypres ended in stalemate. The bitter resistance of French's army appeared heroic to the British public but accomplished little except holding the Allied line. In 1915 the battles of Neuve-Chapellë (from March 10), Ypres again (from April 22), and Loos (from September 25) likewise achieved no positive result. French's indecisive use of his reserves at Loos led to his removal.

French was created a viscount in 1916 and an earl in 1922. He was commander in chief in the United Kingdom and then (1918–21) lord lieutenant of Ireland. In 1919 he published *1914*, his own account of the war.

French Academy, French *ACADÉMIE FRANÇAISE*, French literary academy, established by the French first minister Cardinal de Richelieu in 1634 and incorporated in 1635, and existing, except for an interruption during the era of the French Revolution, to the present day. Its original purpose was to maintain standards of literary taste and to establish the literary language. Its membership is limited to 40. Though it has often acted as a conservative body, opposed to innovations in literary content and form, its membership has included most of the great names of French literature—e.g., Pierre Corneille, Jean Racine, Voltaire, the Viscount de Chateaubriand, Victor Hugo, Joseph-Ernest Renan, and Henri Bergson. Among numerous European literary academies, it has consistently retained the highest prestige over the longest period of time.

French and Indian War, the American phase of a worldwide, nine-years' war (1754–63) fought between France and Great Britain. (The more complex European phase was the Seven Years' War [1756–63].) It determined the control of the vast colonial territory of North America. Three earlier phases of this extended contest for overseas mastery are treated separately: King William's War (1689–97), Queen Anne's War (1702–13), and King George's War (1744–48).

The French and Indian War began over the specific issue of whether the upper Ohio River valley was a part of the British Empire, and therefore open for trade and settlement by Virginians and Pennsylvanians, or part of the French Empire. Behind this issue loomed an infinitely larger one, however: which national culture was to dominate the heart of North America. Settlers of English extraction were in a preponderance in the coveted area, but French exploration, trade, and Indian alliances predominated. As early as 1749, the governor-general of New France specifically ordered the area cleared of all British, with the aim of restricting their settlements to the territory east of the Appalachian Mountains. In the spring of 1754, the French ousted a Virginia force from the forks of the Ohio River, and a skirmish was precipitated by Colonel George Washington. Shortly, Washington's force was surrounded at Fort Necessity, Pa., and forced to surrender. Ultimately the war spread to every part of the world where either of the two nations had territorial interests.

The first four years saw nothing but severe reverses for the British regulars and American colonials, primarily because of superior French land forces in the New World. Lack of colonial assistance to the war effort compounded British problems. By the end of 1757, however, the course of the war began to be altered by three major influences. One was the dynamic leadership of the British prime minister, William Pitt the Elder, who saw that victory in North America was the supreme task in the worldwide struggle and who has been truly called the organizer of victory in the Great War for the Empire. The second was the increasing superiority of British financial and industrial resources, food supplies, and naval equipment, as opposed to growing national bankruptcy and economic paralysis faced by France. Finally, both the British and Americans were becoming seasoned wilderness fighters.

In 1758 and 1759, aided by effective blockades off the coast of France as well as in the Gulf of St. Lawrence, the British won important victories at Louisbourg, Fort Frontenac, Fort Carillon (later Ticonderoga), and Crown Point, and at Fort Duquesne (now Pittsburgh) and Fort Niagara. The climax came with the British victory on the Plains of Abraham (Sept. 13, 1759), where Quebec was forced to surrender and where both commanders, James Wolfe and the Marquis de Montcalm, were fatally wounded (*see* Quebec, Battle of). A year later, Montreal and the whole of New France had fallen. By the Treaty of Paris (Feb. 10, 1763), France ceded its territory on mainland North America east of the Mississippi River (including Canada) to Great Britain; Spain ceded Florida to Britain but in return received the Louisiana Territory (*i.e.*, the western half of the Mississippi River basin) and New Orleans from the French. Though unpopular with the British public, which would have preferred France's rich sugar-producing islands of the West Indies rather than Canada, the 1763 treaty is often thought to mark the beginning of Britain's imperial greatness. Ironically, Britain's problems arising from victory, such as war debts and the administration and settlement of an expanded colonial empire, contained the very seeds of the conflict that would lead to the U.S. War of Independence during the following decade.

French billiards, also called *CAROM BILLIARDS*, game played with three balls (two white and one red) on a table without pockets, in which the object is to score caroms (British cannons) by driving one of the white balls into both of the other balls, counting one point for each carom.

The standard table is 5 by 10 feet (152 by 305 cm), although smaller tables of similar proportions are used. The table is marked with

three spots, one near its head, one at its centre, and one near its foot. The red ball is spotted on the foot spot, the white on the head spot, and the first player's cue ball within six inches directly to either side of the white object ball. The cue ball must contact the red ball on the break (first) shot; on subsequent shots either red or white may be the first ball hit. When a player fails to score, he yields to his opponent, who plays the balls as they have been left. A game is usually continued until one player scores an agreed number of points, often 50.

French Broad River, river rising in the Blue Ridge, Transylvania county, western North Carolina, U.S., and flowing 210 miles (340 km) northeast past Brevard, then northwest past Asheville, N.C., and through the Great Smoky Mountains into Tennessee, where it turns west to join the Holston River near Knoxville, forming the Tennessee River. Douglas Dam and Reservoir, part of the Tennessee Valley Authority (TVA), is on the French Broad east of Knoxville. The river was named French Broad to distinguish it from North Carolina's Broad River. The French Broad flows west and was associated with French settlers to the west. Main tributaries are the Pigeon and Nolichucky rivers.

French bulldog, byname *FRENCHIE*, a small dog of the nonsporting group, which was developed in France in the later 1800s from crosses between small native dogs and small bulldogs of a toy variety. The French bulldog is a small counterpart of the bulldog (*q.v.*), but

French bulldog

© Sally Anne Thompson—Animal Photography Partnership

it has large, erect ears, rounded at the tips. Its skull is flat between the ears and domed above the eyes, and the expression is typically one of alertness, rather than moroseness as in the bulldog. A valued companion and watchdog, the French bulldog stands 28 to 30 cm (11 to 12 inches) and weighs about 10 kg (22 pounds). Its short, fine coat may be any of a number of colours, such as brindle, grayish brown (fawn), or white.

French Championships, byname *FRENCH OPEN*, French in full *CHAMPIONNATS INTERNATIONAUX DE FRANCE DE TENNIS* ("France's International Championships of Tennis"), international tennis championship tournament established as a men's interclub competition in 1891.

The first French national championships were held in the *Stade Français*. In 1897 women's singles matches were added to tournament play. Women's doubles matches were added in 1925, the same year that the French Championships were opened to non-French players. In 1968 the tournament was opened to professional as well as amateur players, as were a number of the most established cham-

pionships. Play moved in 1928 to the Stade Roland-Garros, which contains clay courts. The French Championships are generally held in late May–early June. They are a constituent tournament in the Big Four, or grand slam, of tennis.

For winners of the French Championships, see Sporting Record: *Tennis*.

French Communist Party, French PARTI COMMUNISTE FRANÇAIS (PCF), French political party that espouses a communist ideology and has joined coalition governments with the French Socialist Party.

Founded in 1920 by the left wing of the French Socialist Party, the PCF did not gain significant votes until 1936, when it affiliated with Léon Blum's leftist Popular Front coalition government.

In 1945 the PCF won some 25 percent of the vote in France's first post-World War II election, and in 1946 it took part in the Fourth Republic's first government. After May 1947, when the Communists were dismissed from the cabinet as a result of hardening political attitudes, the PCF did not participate in any Fourth Republic administration, though it won an average of more than 22 percent of the vote in the six general elections from June 1951 to June 1968 and commanded a large representation in the National Assembly.

When General Charles de Gaulle became president of the Fifth Republic in 1958, the PCF lost a good deal of ground in a surge of right-wing and nationalist feeling. In September 1965, the party lent its support to other left-wing parties to form the Federation of the Democratic and Socialist Left (Fédération de la Gauche Démocrate et Socialiste). The alliance succeeded in keeping de Gaulle from an absolute majority in the first round of the 1965 election. In the first round of the June 1969 presidential election, the PCF candidate came in third, with 21 percent of the vote. By the mid-1970s, however, serious strains developed in the alliance of the left; and in 1978 the PCF temporarily abandoned the alliance. The PCF was again allied with the Socialist Party in the 1981 elections. Though its own representation fell dramatically in the National Assembly, it received four cabinet posts in the new socialist government. In 1984, in a change of ministries, it lost these posts.

In 1986, under a proportional election system, the party won 35 seats, though its vote share dropped under 10 percent. In 1993 it dropped to 23 seats in the National Assembly in a rout by the rightist parties before winning 38 seats and returning as a coalition partner with the Socialists in 1997. When the coalition lost power in 2002, however, support for the party fell, and it won only 5 percent of the vote and 21 seats in the National Assembly.

The PCF was a highly disciplined and centralized party with a largely working-class base. It controlled the largest trade-union organization in France, the General Confederation of Labour (Confédération Générale du Travail), and published the daily newspaper *L'Humanité*. The PCF was generally pro-Soviet, and it reestablished party relations with the Chinese Communist Party in 1982. The party by the late 20th century had lost many of its traditional working-class supporters, and, following the collapse of the Soviet Union, the party reevaluated its support for orthodox Marxism, though it continued to declare itself a communist party.

French Community, French LA COMMUNAUTÉ, association of states created in 1958 by the constitution of the Fifth French Republic to replace the French Union (itself the successor of the former French colonial empire) in dealing with matters of foreign policy, defense, currency and economic policy, and higher ed-

ucation. By the late 1970s the association was defunct.

French Congo, French CONGO FRANÇAIS, French possessions in Equatorial Africa from 1897 until 1910, when the colonies of Gabon, Middle Congo (Moyen-Congo), and Ubangi-Shari-Chad were federated under the name Afrique Équatoriale Française (AEF). Thereafter, the term French Congo was used to designate the Middle Congo, until it became the Congo Republic (1959; later the People's Republic of the Congo).

French East India Company, byname of (1664–1719) COMPAGNIE FRANÇAISE DES INDES ORIENTALES (French: "French Company of the East Indies"), or (1719–20) COMPAGNIE DES INDES ("Company of the Indies"), or (1720–89) COMPAGNIE FRANÇAISE DES INDES ("French Company of the Indies"), any of the French trading companies established in the 17th and 18th centuries to oversee French commerce with India, eastern Africa, and other territories of the Indian Ocean and the East Indies.

The French East India Company was established by Jean-Baptiste Colbert, finance minister to King Louis XIV. It had difficulty gaining the financial support of French merchants, and Colbert is thought to have pressured many of them to join. He persuaded François Charpentier of the French Academy to write a glowing advertisement about the benefits of joining the company, asking why the French should purchase gold, pepper, cinnamon, and cotton from foreign merchants. Louis XIV wrote to 119 towns, ordering merchants to gather and discuss subscribing to the company, but many refused. By 1668 the king himself was the biggest investor, and the company was to remain under his control.

In constant competition with the already-established Dutch East Indies Company, the French company mounted expensive expeditions that were often harassed and even confiscated by the Dutch. The French East India Company flourished briefly from 1670 to 1675; but by 1680 little money had been made, and many ships were in need of repair.

In 1719 the company was absorbed by the short-lived Company of the Indies. This company became entangled in the disastrous financial schemes of the fiscal administrator John Law, and it suffered severely in the ensuing French economic crash of 1720. The company was then reorganized as the French Company of the Indies.

The revived company obtained the colonies of Mauritius (Île de France) in 1721 and Mahé in Malabar (India) in 1724. By 1740 the value of its trade with India was half that of the British East India Company. The ablest leader of the company, Joseph-François Dupleix, was appointed the governor-general of French India in 1742. In 1746 he captured Madras but failed to take the neighbouring British fort of St. David. Dupleix allied himself with local Indian powers, but the British supported rival groups, and a private war between the two companies broke out in 1751.

During the Seven Years' War (1756–63) the French were defeated by the English, and Pondicherry, the capital of French India, was captured in 1761. Because the French economy saw more profit from trade in the West Indies, the French East India Company lacked government support. Its monopoly over French trade with India ended in 1769, and the company languished until its disappearance during the French Revolution in 1789.

French Equatorial Africa, French AFRIQUE ÉQUATORIALE FRANÇAISE (AEF), collectively, four French territories in central Africa from 1910 to 1959. In 1960 the former territory of Ubangi-Shari (Oubangui-Chari), to which Chad (Tchad) had been attached in 1920, became the Central African Republic and the

Republic of Chad; the Middle Congo (Moyen-Congo) became the Congo Republic, now the People's Republic of the Congo; and Gabon became the Republic of Gabon.

French Guiana, officially DEPARTMENT OF FRENCH GUIANA, French GUYANE FRANÇAISE, or DÉPARTEMENT DE LA GUYANE FRANÇAISE, overseas *département* of France, situated on the northeastern coast of South America. French Guiana is bounded by Brazil to the south and east, Suriname to the west, and the Atlantic Ocean to the northeast. The capital is Cayenne. Area 32,253 square miles (83,534 square km). Pop. (2004 est.) 182,000.

The land. Geologically, the rock underlying French Guiana forms part of the crystalline massif of the Guiana Highlands. Rivers, which flow generally northeastward to the sea, have greatly eroded the massif, and most of French

French Guiana

Guiana is low-lying. The Maroni River forms the French Guiana–Suriname border in the west, and the Oyapock forms the border with Brazil in the east. The Tumac-Humac Mountains in the south reach an elevation of 2,300 feet (700 m). Recent alluvial deposits have formed a swampy coastal plain southeast of Cayenne. Older alluvial deposits form a savanna west of Cayenne. Dense tropical forests (mostly hardwood) predominate outside the coastal plain and cover more than four-fifths of the land area. French Guiana is subject to heavy rainfall between December and July; annual rainfall reaches 150 inches (3,800 mm) around Cayenne and tapers off toward the northeast. High temperatures predominate, and monthly averages vary between 77° and 80° F (25° and 27° C) at Cayenne. Wildlife includes tapir, caiman, ocelot, sloth, great anteater, and armadillo.

The people. French Guiana's largest ethnic group, the Creoles (mulattoes), constitute about one-third of the population. Other smaller minority groups include French Europeans, Haitians, Surinamese, Antilleans, Chinese, Brazilians, and South and Southeast Asians. The principal languages are French (official), French Creoles, Indian dialects, and the languages of the immigrant communities. The principal religion is Roman Catholicism, adhered to by about four-fifths of the population. A variety of religions are practiced among the Asians. The populace is concentrated principally in and around Cayenne, the largest city, and the coastal regions; the interior is largely uninhabited. There was immigration from Southeast Asia, Haiti, and the French Caribbean territories from the late 20th century.

The economy. French Guiana has a developing market economy, patterned on metropolitan France and sustained by aid from France. Services and the production, processing, and export of agricultural, forestry, and fishing products are the largest sectors of the economy. The gross national product (GNP) per capita is one of the highest in South America.

Agriculture produces about one-twentieth of the gross domestic product (GDP) and employs about one-eighth of the registered work force as well as many small subsistence and part-time farmers. Subsistence farming predominates and centres on the growing of cassava, dasheen (taro), sweet potatoes, rice, corn (maize), and bananas and plantains. Most small farms are worked and owned by families, but there are some large estates engaged in growing cash crops, including sugarcane, limes, bananas, and tropical fruits, largely for export to France.

Forests cover more than four-fifths of the land and contain valuable commercial species. Some of all forestland is reserved by the state, but most is open to exploitation. Most of the timber cut is used for industrial purposes, and of this about two-fifths is exported. Pastures support mainly cattle, pigs, and poultry. Meat and milk production is limited, and large quantities of both must be imported. Shrimps account for most of the annual fish catch.

Mineral industries are of negligible importance, and French Guiana must import mineral fuels and metallic minerals. Gold, gravel, and sand are the only minerals extracted.

The limited manufacturing industries are concentrated on fish, meat, and crop processing and rum and sawn-wood production. Most capital and consumer goods must be imported. Electricity is generated entirely from imported mineral fuels.

Most of the labour force is employed in administration and public services and agriculture. Wages and benefits are legislated at the same rates as those that prevail in France. Unemployment and inflation are high.

Although about two-fifths of the country's roads are paved, the road system is underdeveloped in the interior. Dégrad des Cannes, Larivot, Saint-Laurent du Moroni, and Kourou are principal ports. Some of the country's waterways are navigable by small oceangoing craft, but most are navigable only by shallow-draft vessels. An international airport is at Cayenne. A rocket-launching base at Kourou is used by the European Space Agency.

The balance of trade is unfavourable, with exports covering only about one-tenth of imports. Food products, machinery, consumer goods, and refined petroleum dominate imports; shrimps, forest products, and gold are the leading exports. Major trading partners are France and the United States. French Guiana receives substantial aid and technical assistance from France.

Government and social conditions. French Guiana is governed by the provisions of the French Constitution as an overseas *département* of France and, as such, forms an integral part of the French Republic. It sends two elected representatives to the National Assembly and one to the Senate. Local government is headed by a prefect and by a 19-member General Council and a 31-member Regional Council; members of both are elected by universal adult suffrage. There is a local court of appeal. The principal political party is the Parti Socialiste Guyanais. Other political parties operate freely and include the Rassemblement pour la République (Gaullist), the Union pour la Démocratie Française, and the Unité Guyanaise (Marxist, pro-independence). The violence-oriented Front National Libéré de la Guyane, however, is outlawed.

The social-security system of France is used in French Guiana. It provides payments for work injury, unemployment, and maternity,

as well as family allowances and also old-age, disability, and survivor pensions. Health conditions are generally good. The principal causes of death are diseases of the arteries, accidents, and cancer. The Pasteur Institute, located in Cayenne, conducts research on tropical and endemic local diseases and is renowned throughout Latin America. Life expectancy averages 63 years for men and 70 years for women.

Education is free and compulsory between the ages of 6 and 16. Nearly all eligible children attend. There are private colleges and several teacher-training colleges, and university education is available in France or the French Antilles. The news media are free from direct government control, but subsidies and licensing induce considerable self-control. The principal newspaper is *La Presse de Guyane*, published in Cayenne.

French Guiana's cultural life reflects the diverse background of the resident ethnic communities. Indigenous and African crafts, customs, and arts predominate among American Indians and ethnic blacks. In the metropolitan areas a distinctive mixed-creole culture is dominant, highlighted by brilliantly coloured and distinctively patterned costumes; dances reflecting African, East Indian, and French 18th-century influence; and festivals, especially the pre-Lenten Carnival, when much of the population devotes itself to costume design, musical composition, and dance competitions. Léon Damas, a French Guianese poet, was a leader of the Caribbean *modernismo* literary movement of the 1920s.

History. Spaniards explored the Guiana coast in 1500 and settled the area around Cayenne in 1503. French merchants from Rouen opened a trading centre in Sinnamary in 1624, followed by others from Rouen or Paris who founded Cayenne in 1643. The Treaty of Breda awarded the territory to France in 1667, and the Dutch, who had occupied Cayenne in 1664, were expelled in 1676. Inhabitants of the territory were made French citizens, with representation in the French Parliament after 1877. However, by 1852 the French began using the territory as a penal colony where deported convicts were imprisoned in dreadful conditions exemplified by the notorious Devils Island. More than 70,000 French convicts were deported to French Guiana between 1852 and 1939; the penal colony on Devils Island was abolished only after the startling exposé by Albert Londres (1884–1932). Another aspect of French Guiana, however, was the pioneering community at Mana (1827–46) founded by Anne-Marie Javouhey, mother-superior of the community of St. Joseph of Cluny, who with Father Libermann established one of the earliest educational systems for the freed black slaves and women, in the spirit of French Roman Catholic humanism.

French Guiana became a *département* of France in 1946. The general postwar economic stagnation was partially relieved by the construction of the European Space Agency's rocket-launching base and a new town at Kourou in 1968 and by the adoption in the late 1970s of the Plan Vert ("Green Plan"), which encouraged increased agricultural and forestry production.

French horn, also called HORN, French COR D'HARMONIE, German WALDHORN, the orchestral and military horn derived from the *trompe* (or *cor*) *de chasse*, a large, circular hunting horn that appeared in France in about 1650 and soon began to be used orchestraly. Use of the term French horn dates at least from the 17th century. Valves were added to the instrument in the early 19th century. Modern French horns exist in two principal types, French and German.

The French type, though once dominant in France and England, now is reduced to only

sporadic use. It has about 7 feet (2 m) of integral tubing to which is added a separate coiled crook (a detachable piece of tubing) inserted at the narrow end, lowering the horn's fundamental pitch. The crook, by lengthening the tubing and lowering the series of notes producible, puts the horn in the key of F, the basic tonality of the modern horn. The mouthpiece is slightly cup-shaped, the original straight funnel shape now being obsolete. The right hand of the player is placed inside the bell mouth, and the left actuates the three rotary valves (piston valves in English-made horns); when depressed they deflect air through additional tubing and lower the pitch by certain intervals. In France the third valve is normally an ascending one—i.e., when depressed, it cuts off air from a section of tubing, raising the pitch by a whole tone.

The German type, now universally accepted, has a relatively larger bore, dispenses with the separate crook, and uses rotary valves. It is built in F or a fourth higher in Bb, or, more commonly, as a double horn, introduced about 1900 by Fritz Kruspe, providing for instantaneous choice, by means of a thumb valve, of two tonalities, usually F and Bb or Bb and A. This choice allows technical benefits such as greater certainty on the higher notes. The German bore and the choked mouthpiece also facilitate complex passage work and can deliver a more massive tone. The range of the valved horn extends from the third B below middle C to the second F above (actual pitch). Muting is effected either by inserting a separate mute of closed conical form or by stopping the bell throat with the right hand, raising the pitch approximately a semitone, for which the player compensates.

A symphony orchestra normally includes four horns. Orchestral use of the horn, aside from its appearance in operatic hunting scenes, began in about 1700 when the *trompe de chasse* was introduced from France into Bohemia. Players in the 18th century inserted a hand into the bell to alter the pitch to obtain additional notes, the notes of the *trompe* being limited to the instrument's natural harmonic series (as for the fundamental note C: c–g–c'–e'–g'–bb' [approximate pitch]–c''–d''–e'', etc.), hence the name hand horn. Together with the use of crooks for various tonalities as required, this technique was used for works by Wolfgang Amadeus Mozart and Ludwig van Beethoven but was superseded about 1815 by the two-valved horn and in 1830 by the three-valved horn, which permitted the chromatic scale to be produced even more readily.

French India Company: see French East India Company.

French Indochina (Southeast Asia): see Indochina.

French Island, island within the bay of Western Port, southern Victoria, Australia, southeast of Melbourne, 84 square miles (218 square km) in area. Low and marshy in the northwest, it rises to wooded hills. Farming is carried out on the island, and there is some tourism. The island harbours many birds, koalas, and rat kangaroos (potoroos). Pop. (1986) 69.

French language, French FRANÇAIS, Romance language spoken in France, Belgium, and Switzerland; in Canada (principally Quebec) and northern New England; and in many other countries and regions formerly or currently governed by France. It is an official language of more than 25 countries. Written materials in French date from the Strasbourg Oaths of 842.

The standard for French is based on the dialect of Paris, called Francien, which has been the official standard language since the mid-

16th century. Francien has largely replaced other regional dialects of French spoken in northern and central France; these dialects made up the so-called *langue d'oïl* (the term is based on the French use of the word *oil*, modern *oui*, for "yes"). Standard French has also reduced the use of the Occitan language (*q.v.*) of southern France (the so-called *langue d'oc*, from Provençal *oc* for "yes"). Occitan's major dialect, Provençal, was a widely used medieval literary language. Regional dialects of French survive for the most part only in rural speech, although the Picard-Walloon dialect of northern France and the Norman dialect of western France gave strong competition to Francien in medieval times, and Walloon is still spoken in Belgium. Other dialects include Orléanais, Bourbonnais, Champenois, Lorrain, Limosin, Picard, Breton, Bourguignon, Franc-Comtois, Gallo, Angevin, Maine, Poitevin, Saintongeais, and Angoumois.

French phonology is characterized by great changes in the sounds of words as compared to their Latin parent forms as well as to cognates in the other Romance languages. For example, Latin *secūrum* "sure, secure" became Spanish *seguro* but French *sûr*; Latin *vocem* "voice" became Spanish *voz* but French *voix*, pronounced *vwa*.

French grammar, like that of the other Romance languages, has been greatly simplified from that of Latin. Nouns are not declined for case. Formerly, they were marked for plural by the addition of *-s* or *-es*, but the ending, though retained in spelling, has generally been lost in speech. Masculine and feminine gender are distinguished but are usually marked not in the noun but rather in the accompanying article or adjective. Plural marking in spoken French is often similarly distinguished. The verb in French is conjugated for three persons, singular and plural, but again, although distinguished in spelling, several of these forms are pronounced identically. French has verb forms for indicative, imperative, and subjunctive moods; preterite, imperfect, present, future, and conditional, and a variety of perfect and progressive tenses; and passive and reflexive constructions.

French literature, the body of written works produced in the French language, in France and in French-speaking lands beyond its borders. French was one of the five major Romance languages to develop from Vulgar Latin as a result of the Roman occupation of western Europe. For the French-language literatures of countries other than France, see African arts; Belgian literature; Canadian literature.

A brief treatment of the French literature of France follows. For full treatment, see MACROPAEDIA: French Literature.

The earliest evidence of literature in recognizable Old French is the Romance version of the Oath of Strasbourg (842). A few other texts, all religious in content, survive from before about 1100. The origins of French literature are thus obscure. After the 12th century there is more written evidence, particularly in the form of historical chronicles. More than 80 chansons de geste (songs of deeds) have survived. The earliest is the *Chanson de Roland*, known only from a manuscript copied in England in about 1100.

Until the 13th century it seems that the major French literary activities following the Norman Conquest had been in England, but during the 13th and 14th centuries French literature developed again in its homeland. A progression from local epics before the 13th century to the adaptation of the major epics of antiquity and of the themes of the Arthurian cycle is clear. The vehicle for the expression of these epics,

oral poetry, continued through the Middle Ages, as did allegory, a popular form exemplified in the *Roman de la rose*. The earliest French dramas are the liturgical plays, the *mystères*, which are based on biblical stories, and the *miracles*, which involve the miraculous intervention of a saint. By the 14th century the *mystères* and *miracles* gave way to *moralités*, didactic in intention, which were satirical farces without political or moral intent.

The 14th century brought an extension in scope and popularity of the existing literary genres in France. One example is the wide range of fabliaux (comic verse tales) written in this period. Fables, especially animal tales, also grew in popularity. The copying of manuscripts reached a peak with illuminated manuscripts, and a new start was made in historical chronicles with the *Grandes Chroniques de Saint-Denis*. Jean Froissart was the great chronicler of European history during the 14th century. Eustache Deschamps published the first work on French versification, and Guillaume de Machaut was the greatest poet and musician of the age. It was François Villon, however, who was the precursor of French Classicism.

The 16th century is one of the richest and most varied French literary periods: it saw the passing of the Middle Ages and the growth and maturity of the Renaissance, producing such unique figures as the humorist François Rabelais, the poet Pierre de Ronsard, and the essayist Michel de Montaigne. Until the middle of the 16th century plays like those of the medieval period were still being produced, but with the Renaissance came an entirely new class of subjects and modes of treatment that swept away all except the farce. The change came from Italy, inspired by new translations of ancient Greek and Roman classics. In poetry there was an enormous wealth and variety at this time. Ronsard formed La Pléiade with six other French Renaissance poets and set out to create a literature to rival Italy's. Prose writers on political, theological, and scientific subjects were numerous.

François de Malherbe, the first important poet of the next period, called for refinement of the language. In the first half of the 17th century the polish and elegance of French prose reflected a desire for stability in a world of change. The philosophers René Descartes and Blaise Pascal were known for their prose styles as well as for their philosophies. In the theatre Pierre Corneille and Jean Racine, the masters of French classical tragedy, were enormously successful, and Molière wrote a brilliant succession of comedies that writers of the next period found difficult to match. Nicolas Boileau and Jean de la Fontaine made important strides in 17th-century poetry, and Marie de La Fayette wrote the first novel proper, *La Princesse de Clèves*—but these works were written within strict Classical conventions, against which the 18th century was to see a vigorous reaction.

The revocation of the Edict of Nantes of 1685, which granted increased religious liberty to French Protestants, marked a new era in French literature. Classicism was not yet extinct, but there was an abundance of ecclesiastical literature, some of which prefigured the Enlightenment. Important changes were about to happen: 18th-century tragedy became identified with Voltaire, and comedy with the socially aware farces of Pierre Beaumarchais. The poetic output of the 18th century was enormous, and the novel grew in stature; but the century is most famous for the development, in literature, of its rational thought, exemplified in Voltaire's *Lettres philosophiques* and in the work of the encyclopaedist Denis Diderot.

The philosophic basis of the French Revolution was laid by writers who did not live to witness it—Voltaire, Diderot, and Jean-Jacques Rousseau—and the demands of the

struggle were such that there was little scope for literature. Nor did the Consulate and Empire provide better conditions, and writers worked in secret, among them François-René de Chateaubriand. The way was thus open for the literary revolution that arose from the change in political climate. More freedom came with the restoration of the monarchy, resulting in the literary achievements of the French Romantics: in poetry the great names were Alphonse de Lamartine, Alfred de Vigny, Victor Hugo, and Alfred de Musset. The Romantic movement revived the theatre and gave new prestige to the novel. Honoré de Balzac portrayed contemporary life in his great collection of novels, *La Comédie humaine*; like those of Stendhal (pseudonym of Marie-Henri Beyle), his novels are social and political documents. Historical and critical studies, exemplified by the criticism of Charles-Augustin Sainte-Beuve, also became accepted genres in French literature.

The social upheavals of 1848 checked Romanticism, and the Parnassian movement took over. The two movements were bridged by Hugo and by the poet Charles Baudelaire, whose melancholia and idealism attached him to Romanticism but whose rigour of technique purged it of its faults. The Parnassian poets—heralded by Théophile de Gautier, who expounded the doctrine of "art for art's sake"—aimed to rescue French verse from the verbal and emotional imprecision of the Romantics.

Apparently unaffected by the Franco-Prussian War of 1870, Emile Zola took realism a step farther by creating the Naturalist school, in which the novel was to serve the same ends as a scientific thesis. The short-story writer Guy de Maupassant belonged to this school, whereas his rival Anatole France reacted against it. In poetry, Baudelaire opened the way to Symbolism, and Arthur Rimbaud became the explorer who blazed the trail for modern poetry. Symbolism treated the senses as a reflection of the spiritual universe, and Stéphane Mallarmé became a central figure in the movement.

Only a few important 20th-century novels appeared before 1919, none touching the beauty and complexity of Marcel Proust's *À la recherche du temps perdu* (1914–27). Proust and then André Gide dominated French fiction until 1940. In his *Les Faux-Monnayeurs* Gide expounded the theme of the amoral adolescent. Little survived of World War I literature, and there followed a realist-revolutionary crisis. Observation and fantasy combine in the regional novelists, the greatest of whom is Jean Giono. Such writers as François Mauriac, Julien Green, and Georges Bernanos preferred to use the novel as a vehicle for the exploration of the psyche. In the novel of adventure Joseph Kessel is outstanding, while André Malraux gave his novels philosophical significance.

The real explosion in the novel did not happen until after 1940, with the work of Simone de Beauvoir, Albert Camus, and Jean-Paul Sartre, who were primarily concerned with the novel as a vehicle for political or philosophical ideas. Samuel Beckett stripped humanity to its essence in bleak, stark, yet somehow humorous scenarios. The antinovel (*nouveau roman*), as practiced by Alain Robbe-Grillet and others, attacked the formal elements of storytelling, bringing certain modernist tendencies to their logical conclusion. In the last few decades of the 20th century, there was an increasing erosion of boundaries between fiction and nonfiction.

At the turn of the 20th century the theatre had been torn between neo-symbolism and social realism and only broke free after 30 years: between 1920 and 1940 the stage play was less experimental than circumstances allowed, with no successful innovations. The most original post-1940 dramatist was Jean Genet, with his complex antinaturalistic and antisocial the-

atre, but the turning point came in 1950 with Eugene Ionesco and his "pure" theatre, stripped of convention, abstract, crudely poetic, and imaginative.

Until Guillaume Apollinaire the only real poetic achievement of the century was the stabilizing of free verse. Apollinaire synthesized contemporary forms and pointed them in new directions—he reconciled classical intellectuality and form with Romantic enthusiasm, intuition, and experimentation. After him, French poets, with a few exceptions, largely turned away from experimentation.

French Polynesia, officially TERRITORY OF FRENCH POLYNESIA, French TERRITOIRE DE LA POLYNÉSIE FRANÇAISE, collection of island groups and overseas territory of France in the south-central Pacific Ocean. The territory covers an area (including inland water) of some 1,550 square miles (4,000 square km). The capital is Papeete on the island of Tahiti. The islands are scattered across the Pacific between latitudes 7° and 27° S and longitudes 134° and 155° W; there are 130 islands divided into five archipelagoes: the Society Islands, the Tuamotu Archipelago, the Gambier Islands, the Marquesas Islands, and the Tubuai Islands. Tahiti (402 square miles [1,042 square km]) in the Society group is the largest island. Pop. (1996) 219,521.

French Polynesia

A brief treatment of French Polynesia follows. For full treatment, see *MACROPAEDIA: Pacific Islands*.

For current history and for statistics on society and economy, see *BRITANNICA BOOK OF THE YEAR*.

The land. The islands can be divided into two distinct physiographic groups: the less numerous but larger high volcanic islands (Society, Tubuai, Marquesas, and Gambier) and the more numerous low coral islands (e.g., Tuamotu). The volcanic islands are mountainous with rugged peaks, deep and narrow valleys, fast-flowing rivers, narrow coasts, fertile soil, and dense vegetation. Mount Orohena on Tahiti, at 7,352 feet (2,241 m) above sea level, is the highest point of the territory. The coral islands lack soil cover and permanent streams, raising supply problems for agriculture and drinking water. Coconut plantations are the primary vegetation on the coral islands.

French Polynesia's climate is tropical. At Papeete the annual average temperature is 79° F (26° C), ranging from 70° F (21° C) in the cool and dry season (May–October) to 91° F (33° C) in the warm rainy season (November–April). Precipitation is abundant, varying from 120 inches (3,050 mm) near the coasts to 160 inches (4,060 mm) in the mountains. The relative humidity is always high (80 to 90 percent). French Polynesia is subject to typhoons between December and February.

Most plant species on the islands were introduced by the first Polynesians, with others added by Europeans. Coconuts, cassava, pineapples, watermelons, potatoes, tomatoes,

lettuce, cucumbers, taros, and bananas are the chief crops. The only minerals are phosphate and cobalt found in the Tuamotu Archipelago.

The people. More than two-thirds of the population is Polynesian. Part-Polynesians known as Demis account for about one-tenth of the total. The Demis represent a strong economic and political force, being a combination of French Polynesia's two most influential cultures, European and Polynesian. Minority groups consist of Chinese and part-Chinese, who comprise 5 percent of the population, Europeans (mostly French), who make up one-eighth of the population, and Americans. The official languages are French and Tahitian, which has a number of dialects and is used by many of the indigenous islanders. More than half of the population is Protestant (mostly members of the Evangelical Church of French Polynesia), and two-fifths is Roman Catholic, with smaller communities of Mormons and other Christians.

French Polynesia's relatively high average annual growth rate is the result of a high birth rate and a moderate death rate. In the 1960s and '70s a nuclear-testing program and growing tourism prompted many outer islanders to relocate on the main islands, and during the 1970s significant emigration to New Caledonia also affected the growth rate. Roughly one-third of the population is younger than 15 years of age.

More than two-thirds of the population lives on Tahiti. Immigration to Tahiti from the other islands during the 1970s and '80s pressured Tahiti's economic and social facilities. About three-fifths of French Polynesia's population is urban.

The economy. The economy of French Polynesia is based for the most part on administrative and commercial services and on light industries, and it depends heavily on French aid. The territory's chief source of revenue is tourism.

Agriculture accounts for less than 5 percent of the gross national product (GNP) and is dominated by the production of copra and vanilla for export and vegetables and tropical fruits for local consumption. Pigs, cattle, and goats are raised. Large quantities of foodstuffs are imported. Freshwater and marine fishing, as well as oyster and shrimp farming, provide livelihood to many islanders. Cultured pearls are exported from the Tuamotu and Gambier islands.

Mineral industries are of negligible economic importance, and fuels, mineral raw materials, and metals must be imported. Manufacturing industries account for more than 5 percent of the GNP, and they consist mostly of small-scale enterprises that produce coconut oil, processed foods, beer, construction materials, printed cloth, and publications.

Electricity is primarily generated from imported fuels. A hydroelectric power station was opened in Tahiti in 1981.

With the introduction of international air service in 1960 and subsequently of inter-island service, tourism has grown. Visitors come largely from the United States, France, and Australia. The country's international airport is at Faaa, near Papeete, and interisland shipping is a major means of local transport; the main seaport is Papeete.

The islands' trade traditionally has been dominated by France, which still supplies nearly half of the total imports. French Polynesia's largest export market is Japan, which receives roughly two-fifths of the total. Other major trading partners include the United States, Australia, and New Zealand. Black cultured pearls account for more than three-fifths of the total value of exports.

Government and social conditions. French Polynesia, an overseas territory of France, is represented in the French Parliament by two deputies and one senator. Pressure for increased self-government produced new stat-

utes in 1977, 1984, 1990, and 1996 that provided for greater local autonomy, with the French maintaining control of foreign affairs, defense, monetary policy, and justice. Legislative power resides with the Territorial Assembly, whose 41 members are directly elected to five-year terms. The high commissioner, who is appointed by the French government, is the chief executive and holds considerable power. The Council of Ministers is headed by a president elected by the Assembly from among its members and holds significant administrative power, especially in the areas of commerce and development. Justice is administered by the Supreme Court of Appeal and the Court of First Instance.

French Polynesia has adequate health services and a relatively high standard of living, both maintained primarily through French financial aid. Well-dispersed health facilities include the main hospital in Papeete, regional hospitals in each outer island group, and a service that provides regular periodic doctor visits to all outer islands and atolls. Life expectancy at birth is 70 years for males and 75 years for females.

Free education (compulsory through the end of primary school) is provided in government-run primary, secondary, and technical schools, supplemented by church-run schools. The University of the Pacific (established in 1987) has its administrative centre in Papeete. Almost all of the population is literate. French-language newspapers are free of censorship. Radio and colour-television broadcasting is operated by the government.

Cultural life. French Polynesian culture is based on folk arts and traditions. The absence of newspapers in Tahitian, the small amount of broadcasting in the Tahitian language, and the nonrecognition of vernacular languages as official hamper efforts to protect the indigenous culture. Traditional outrigger canoes (*pirogues*) are still widely used, but traditional culture has waned with the increasing impact of western-European-style culture and technology. The Gauguin Museum in Tahiti contains numerous Polynesian artifacts, including Easter Island-like statues from Raivavae. Traditional Polynesian dances and ceremonies on Tahiti are performed for tourists in hotels and on days when tour ships are in port. On the outer islands, cultural traditions have survived to a greater extent. Foreign settlement on Maiao is banned; on Raiatea in Apooiti village, fire walking is practiced; and nearby the Tapu-tapuata marae, built of coral slabs and formerly the most sacred spot in French Polynesia, has been restored as a historical monument. The introduction of Tahiti-based radio has hastened the loss of local dialects and customs.

History. The Marquesas Islands of French Polynesia were probably settled by AD 300 by Polynesians from Tonga and Samoa, who dispersed from the Marquesas to the rest of what is now French Polynesia. Ferdinand Magellan sighted Pukapuka in the Tuamotu Archipelago in 1521. During Captain James Cook's first voyage (1769), the Society Islands were named after the expedition's sponsor, Britain's Royal Society. In the late 18th century the adventures of HMS *Bounty* took place in the waters of French Polynesia.

Missionaries arrived in Tahiti in 1797, and by 1815 their labours were rewarded when the Tahitian chief Pomare II converted to Christianity. In 1842 Tahiti became a French protectorate and in 1880 a colony. The Gambier group became a protectorate in 1844 and a colony in 1881. Rimatara and Rurutu became protectorates and colonies of France in 1889 and 1900, respectively. The Tuamotu Islands became dependencies of Tahiti in 1847 and part of the colony in 1880. The chiefs of the

Marquesas Islands ceded sovereignty to France in 1842.

Administratively, the islands were originally part of the French Colony of Oceania. After World War II French Polynesia became an overseas territory of France. Under the leadership of Pouvanaa a Oopa the pro-autonomy party, Tahitian People's Democratic Assembly (Rassemblement Democratique des Populations Tahitiennes), won majorities in the Territorial Assembly in 1953 and 1957. Pouvanaa was arrested and exiled by French authorities in 1960. The movement toward autonomy continued under John Teariki and Francis Sanford in the 1960s and '70s. Pouvanaa was finally released in 1971 and was promptly elected as the territory's representative to the French Senate. In 1966 the French began nuclear testing on Mururoa atoll. This atoll and neighbouring Fangataufa atoll were ceded to France by the Territorial Assembly in 1964. In 1975 worldwide opposition forced the French to move the testing underground on Fangataufa. In the late 1970s the autonomy movement continued, and the French national assembly granted partial autonomy to French Polynesia in 1977. France suspended nuclear testing in 1992 but resumed it in 1995. Against a backdrop of international pressure and rioting, France terminated further testing in 1996.

French republican calendar, dating system that was adopted in 1793 during the French Revolution and which was intended to replace the Gregorian calendar with a more scientific and rational system that would avoid Christian associations. The Revolutionary Convention established the calendar on Oct. 5, 1793, setting its beginning (1 Vendémiaire, year I) on the Gregorian date of Sept. 22, 1792.

The 12 months of the French republican calendar each contained three decades (instead of weeks) of 10 days each; at the end of the year were grouped five (six in leap years) supplementary days. The months in order were Vendémiaire, Brumaire, Frimaire, Nivôse, Pluviôse, Ventôse, Germinal, Floréal, Prairial, Messidor, Thermidor, and Fructidor. Each of the 360 days in the year was named for a seed, tree, flower, fruit, animal, or tool, replacing the saints'-day names and Christian festivals. The Gregorian calendar was reestablished in France by the Napoleonic regime on Jan. 1, 1806.

French Revolution, also called REVOLUTION OF 1789, the revolutionary movement that shook France between 1787 and 1799 and reached its first climax there in 1789. The conventional term, "Revolution of 1789," denotes the end of the ancien régime in France and serves to distinguish that event from the later French revolutions of 1830 and 1848.

A brief treatment of the French Revolution follows. For full treatment, see MACROPAEDIA: France.

Although historians disagree on the causes of the Revolution, the following reasons are commonly adduced: (1) the increasingly prosperous elite of wealthy commoners—merchants, manufacturers, and professionals, often called the bourgeoisie—produced by the 18th century's economic growth resented its exclusion from political power and positions of honour; (2) the peasants were acutely aware of their situation and were less and less willing to support the anachronistic and burdensome feudal system; (3) the Philosophes, who advocated social and political reform, had been read more widely in France than anywhere else; (4) French participation in the United States War of Independence had driven the government to the brink of bankruptcy; and (5) crop failures in much of the country in 1788, coming on top of a long period of economic difficulties, made the population restless.

Aristocratic revolt, 1787–89. The revolution took shape when the controller general of finances, Charles-Alexandre de Calonne, summoned an assembly of "notables" (prelates, great noblemen, and a few representatives of the bourgeoisie) in February 1787 to propose reforms designed to eliminate the budget deficit by increasing the taxation of the privileged classes. The assembly refused to take responsibility for the reforms and suggested the calling of the Estates-General, which represented the clergy, the nobility, and the Third Estate (the commoners) and which had not met since 1614. The efforts by Calonne's successors to enforce fiscal reforms in spite of the resistance by the privileged classes led to the so-called revolt of the "aristocratic bodies," notably that of the *parlements* (the most important courts of justice), whose powers were curtailed by the edict of May 1788. During the spring and summer of 1788, there was unrest among the populace in Paris, Grenoble, Dijon, Toulouse, Pau, and Rennes. The king, Louis XVI, yielded; reappointing reform-minded Jacques Necker as the finance minister, he promised to convene the Estates-General on May 5, 1789. His granting of freedom of the press precipitated the publication of pamphlets addressing the reconstruction of the state. The elections to the Estates-General, held between January and April 1789, coincided with further disturbances, as the harvest of 1788 had been a bad one. There were practically no exclusions from the voting; and the electors drew up *cahiers de doléances*, which listed their grievances and hopes. They elected 600 deputies for the Third Estate, 300 for the nobility, and 300 for the clergy.

Events of 1789. The Estates-General met at Versailles on May 5, 1789. They were immediately divided over a fundamental issue: should they vote by head, giving the advantage to the Third Estate, or by estate, in which case the two privileged orders of the realm might outvote the third? On June 17, the bitter struggle over this legal issue finally drove the deputies of the Third Estate to declare themselves the National Assembly and to threaten to proceed without the other two orders. They were supported by many of the parish priests, who outnumbered the aristocratic clergy among the church's deputies. When royal officials locked the deputies out of their regular meeting hall on June 20, they occupied the king's indoor tennis court (*jeu de paume*) and swore an oath not to disperse until France had a new constitution. The king grudgingly gave in and urged the nobles and the upper clergy to join the assembly, which took the official title of National Constituent Assembly on July 9; at the same time, however, he began gathering troops to dissolve it.

These two months of prevarication at a time when the problem of maintaining food supplies had reached its climax infuriated the towns and the provinces. Rumours of an "aristocratic conspiracy" by the king and the privileged to overthrow the Third Estate led to the Great Fear of July 1789, when the peasants were nearly panic-stricken. The gathering of troops around Paris and the dismissal of Necker provoked insurrection in the capital. On July 14, 1789, the Parisian crowd seized the Bastille, a symbol of royal tyranny. Again the king had to yield; visiting Paris, he showed his recognition of the sovereignty of the people by wearing the tricolour cockade.

In the provinces, the Great Fear of July led the peasants to rise against their lords. The nobles and the bourgeois now took fright. The National Constituent Assembly could see only one way to check the peasants; on the night of Aug. 4, 1789, it decreed the abolition of the feudal regime and of the tithe. Then on August 26, it introduced the Declaration of the Rights of Man and of the Citizen, proclaiming liberty, equality, the inviolability of property, and the right to resist oppression.

The decrees of August 4 and the Declaration were such innovations that the king refused to sanction them. The Parisians rose again and on October 5 marched to Versailles. The next day they brought the royal family back to Paris. The National Constituent Assembly followed the court, and in Paris it continued to work on the new constitution.

French citizens participated actively in the new political culture created by the Revolution. Dozens of uncensored newspapers kept citizens abreast of events, and political clubs allowed them to voice their opinions. Public ceremonies such as the planting of "trees of liberty" in small villages and the Festival of Federation, held in Paris in 1790 on the first anniversary of the storming of the Bastille, were symbolic affirmations of the new order.

The new regime. The National Constituent Assembly completed the abolition of feudalism, suppressed the old "orders," established civil equality among men (at least in metropolitan France, since slavery was retained in the colonies), and made more than half the adult male population eligible to vote, although only a small minority met the requirement for becoming a deputy. The decision to nationalize the lands of the Roman Catholic church in France to pay off the public debt led to a widespread redistribution of property. The bourgeoisie and the peasant landowners were undoubtedly the chief beneficiaries, but some farmworkers also were able to buy land. Having deprived the church of its resources, the assembly then resolved to reorganize the church, enacting the Civil Constitution of the Clergy, which was rejected by the pope and by many of the French clergy. This produced a schism that aggravated the violence of the accompanying controversies.

The complicated administrative system of the ancien régime was swept away by the National Constituent Assembly, which substituted a rational system based on the division of France into *départements*, districts, cantons, and communes administered by elected assemblies. The principles underlying the administration of justice were also radically changed, and the system was adapted to the new administrative divisions. Significantly, judges were to be elected.

The National Constituent Assembly tried to create a monarchical regime in which the legislative and executive powers were shared between the king and an assembly. This regime might have worked if the king had really wanted to govern with the new authorities, but Louis XVI was weak and vacillating and was the prisoner of his aristocratic advisers. On June 20–21, 1791, he tried to flee the country, but he was stopped at Varennes and brought back to Paris.

Counterrevolution, regicide, and the Reign of Terror. The events in France gave new hope to the revolutionaries who had been defeated a few years previously in the United Provinces, Belgium, and Switzerland. Likewise, all those who wanted changes in England, Ireland, the German states, the Austrian lands, or Italy looked upon the Revolution with sympathy.

A number of counterrevolutionaries—nobles, ecclesiastics, and some bourgeois—abandoned the struggle in France and emigrated. As "émigrés," many formed armed groups close to the northeastern frontier of France and sought help from European rulers. At first indifferent to the Revolution, many rulers began to worry when the National Constituent Assembly proclaimed a revolutionary principle of international law, namely that a people had the right of self-determination. In accordance with this principle, the papal territory of Avignon was reunited with France on Sept. 13, 1791. By early 1792, both radicals, eager to spread the principles of the Revolution, and the king, hopeful that war would either strengthen his authority or allow foreign armies to rescue him, supported an aggressive

policy. France declared war against Austria on April 20, 1792.

In the first phase of the war (April–September 1792), France suffered defeats; Prussia joined the war in July, and an Austro-Prussian army crossed the frontier and advanced rapidly toward Paris. Believing that they had been betrayed by the king and the aristocrats, the Paris revolutionaries rose on Aug. 10, 1792, occupied Tuileries Palace, where Louis XVI was living, and imprisoned the royal family in the Temple. At the beginning of September, the Parisian crowd broke into the prisons and massacred the nobles and clergy held there. Meanwhile, volunteers were pouring into the army as the Revolution had awakened French nationalism. In a final effort the French forces checked the Prussians on Sept. 20, 1792, at Valmy. On the same day, a new assembly, the National Convention, met. The next day it proclaimed the abolition of the monarchy and the establishment of the republic.

In the second phase of the war (September 1792–April 1793), the revolutionaries got the better of the enemy. Belgium, the Rhineland, Savoy, and the county of Nice were occupied by French armies. Meanwhile, the National Convention was divided between the Girondins, who wanted to organize a bourgeois republic in France and to spread the revolution over the whole of Europe, and the Montagnards, or Men of the Mountain, who, with Robespierre, wanted to give the lower classes a greater share in political and economic power. Despite efforts made by the Girondins, Louis XVI was judged by the Convention, condemned to death for treason, and executed on Jan. 21, 1793; the queen, Marie-Antoinette, was guillotined nine months later.

In the spring of 1793, the war entered a third phase, marked by new French defeats. Austria, Prussia, and Great Britain formed a coalition (later called the First Coalition), to which most of the rulers of Europe adhered. France lost Belgium and the Rhineland, and invading forces threatened Paris. These reverses, as those of 1792 had done, strengthened the extremists. The Girondin leaders were driven from the National Convention, and the Montagnards, who had the support of the Paris sansculottes (workers, craftsmen, and shopkeepers), seized power and kept it until 9 Thermidor, year II, of the new French republican calendar (July 27, 1794). The Montagnards were bourgeois liberals like the Girondins, but under pressure from the sansculottes and in order to meet the requirements of defense they adopted a radical economic and social policy. They introduced the Maximum (government control of prices), taxed the rich, brought national assistance to the poor and to the disabled, declared that education should be free and compulsory, and ordered the confiscation and sale of the property of émigrés. These exceptional measures provoked violent reactions: the Wars of the Vendée, the “federalist” risings in Normandy and in Provence, the revolts of Lyon and Bordeaux, and the insurrection of the Chouans in Brittany. Opposition, however, was broken by the Reign of Terror (19 Fructidor, year I–9 Thermidor, year II [Sept. 5, 1793–July 27, 1794]), which entailed the arrest of at least 300,000 suspects, 17,000 of whom were sentenced to death and executed while more died in prisons or were killed without any form of trial. At the same time the revolutionary government raised an army of more than one million men.

Thanks to this army, the war entered its fourth phase (beginning in the spring of 1794). A brilliant victory over the Austrians at Fleurus on 8 Messidor, year II (June 26, 1794), enabled the French to reoccupy Belgium. Victory made the Terror and the economic and social restrictions seem pointless. Robespierre, “the Incorruptible,” who had sponsored the restrictions, was overthrown in the National Convention on 9 Thermidor, year II (July 27,

1794), and executed the following day. Soon after his fall the Maximum was abolished, the social laws were no longer applied, and efforts toward economic equality were abandoned. Reaction set in; the National Convention began to debate a new constitution; and, meanwhile, in the west and in the southeast, a royalist “White Terror” broke out. Royalists even tried to seize power in Paris but were crushed by the young general Napoleon Bonaparte on 13 Vendémiaire, year IV (Oct. 5, 1795). A few days later the National Convention dispersed.

The Directory and revolutionary expansion. The constitution of the year III, which the National Convention had approved, placed executive power in a Directory of five members and legislative power in two chambers, the Council of Ancients and the Council of the Five Hundred (together called the Corps Législatif). This regime, a bourgeois republic, might have achieved stability had not war perpetuated the struggle between revolutionaries and counterrevolutionaries throughout Europe. The war, moreover, embittered existing antagonisms between the Directory and the legislative councils in France and often gave rise to new ones. These disputes were settled by coups d'état, chiefly those of 18 Fructidor, year V (Sept. 4, 1797), which removed the royalists from the Directory and from the councils, and of 18 Brumaire, year VIII (Nov. 9, 1799), in which Bonaparte abolished the Directory and became the leader of France as its “first consul.”

After the victory of Fleurus, the progress of the French armies in Europe had continued. The Rhineland and Holland were occupied, and in 1795 Holland, Tuscany, Prussia, and Spain negotiated for peace. When the French army under Bonaparte had entered Italy (1796), Sardinia came quickly to terms. Austria was the last to give in (Treaty of Campo Formio, 1797). Most of the countries occupied by the French were organized as “sister republics,” with institutions modeled on those of Revolutionary France.

Peace on the continent of Europe, however, did not end revolutionary expansion. The majority of the directors had inherited the Girondin desire to spread the Revolution over Europe and listened to the appeals of Jacobins abroad. Thus French troops in 1798 and 1799 entered Switzerland, the Papal States, and Naples and set up the Helvetic, Roman, and Parthenopean republics. Great Britain, however, remained at war with France. Unable to effect a landing in England, the Directory, on Bonaparte's request, decided to threaten the British in India by occupying Egypt. An expeditionary corps under Bonaparte easily occupied Malta and Egypt, but the squadron that had conveyed it was destroyed by Horatio Nelson's fleet at the Battle of the Nile on 14 Thermidor, year VI (Aug. 1, 1798). This disaster encouraged the formation of a Second Coalition of powers alarmed by the progress of the Revolution. This coalition of Austria, Russia, Turkey, and Great Britain won great successes during the spring and summer of 1799 and drove back the French armies to the frontiers. Bonaparte thereupon returned to France, to exploit his own great prestige and the disrepute into which the military reverses had brought the government. His coup d'état of 18 Brumaire overthrew the Directory and substituted the consulate. Although Bonaparte proclaimed the end of the Revolution, he himself was to spread it in new forms throughout Europe.

(1998); William Doyle, *The Oxford History of the French Revolution* (1989, reprinted 1992); and David Andress, *French Society in Revolution, 1789–1799* (1999). Samuel F. Scott and Barry Rothaus (eds.), *Historical Dictionary of the French Revolution 1789–1799*, 2 vol. (1985), is a reliable source.

French revolutionary and Napoleonic wars, a series of wars between 1792 and 1815 that ranged France against shifting alliances of other European powers and that produced a brief French hegemony over most of Europe. The revolutionary wars, which may for convenience be held to have been concluded by 1801, were originally undertaken to defend and then to spread the fruits of French Revolution. With Napoleon's rise to absolute power, France's aims in war reverted to simple aggrandizement of influence and territory.

A brief treatment of the French revolutionary and Napoleonic wars follows. For full treatment, see MACROPAEDIA: European History and Culture.

The overthrow of Louis XVI and the establishment of republican government placed France at odds with the primarily monarchical and dynastic governments of the rest of Europe. In the Declaration of Pillnitz (1791) Austria and Prussia issued a provocative general call to European rulers to assist the French king reestablish himself in power. France declared war in April 1792. On Sept. 20, 1792, French forces under Charles-François Dumouriez and François-Christophe Kellermann turned back an invading Prussian-Austrian force at Valmy, and by November the French had occupied all of Belgium. Early in 1793 Austria, Prussia, Spain, the United Provinces, and Great Britain formed the first of seven coalitions that would oppose France in the next 23 years. In response to reverses at the hands of the First Coalition, the Revolutionary government declared a levy en masse, by which all Frenchmen were placed at the disposal of the army. By that means unprecedentedly large armies were raised and put in the field during this period. Battles on the Continent in the mid-18th century typically had involved armies of about 60,000 to 70,000 troops, but after 1800 Napoleon routinely maneuvered armies of 250,000; and he invaded Russia in 1812 with some 600,000.

By early 1795 France had defeated the allies on every front and had pushed to Amsterdam, the Rhine, and the Pyrenees; more importantly, Prussia had been forced out of the coalition and had signed a separate peace that held until 1806. In May 1795 the United Provinces of the Netherlands became the French-influenced Batavian Republic. In northern Italy, a strongly positioned French army threatened Austrian-Sardinian positions, but its commander proved reluctant to move. In March 1796 he was replaced by a more dynamic general, Napoleon Bonaparte.

Napoleon executed a brilliant campaign of maneuver against Austrian and Sardinian forces in Italy and in the resultant treaty of Campo Formio forced Austria to cede the Austrian Netherlands (now Belgium and Luxembourg), which became the first territorial additions to the French Republic, and to recognize the Cisalpine and Ligurian republics established by French power in northern Italy.

Napoleon's next campaign was a major failure. He sailed an army to Egypt in May 1798 with the idea of conquering the Ottoman Empire. The defeat of a French naval squadron by Admiral Horatio Nelson in the Battle of the Nile (Aug. 1, 1798) left him without sufficient naval support, however, and, after failing to take Acre in 1799, Napoleon withdrew to France. His army continued to occupy Egypt until 1801. Meanwhile, other French forces had occupied new territories and established republican regimes in Rome, Switzerland (the Helvetic Republic), and the Italian Piedmont (the Parthenopean). As a result the Second Coalition formed, comprising Britain, Russia, the Ottoman Empire, Naples, Portugal, and Austria. The allies' initial successes were reversed by their inability to agree on strategy,

however, and by the time Napoleon became the first consul of France by the coup d'état of 18 Brumaire, year VIII (Nov. 9, 1799), the danger of foreign intervention against the Revolution in France was over. A victory over Austria at Marengo in 1800 and the consequent Treaty of Lunéville left France the dominant power on the continent. For two years thereafter only Great Britain, with its powerful navy, remained to oppose Napoleon. Nelson's smashing victory at Trafalgar (Oct. 21, 1805) ended a French threat to invade England. In 1805 a Third Coalition formed with Britain, Russia, and Austria. Napoleon won major victories at Ulm and Austerlitz in 1805 and at Jena, Auerstädt, and Lübeck, over the new coalition member Prussia, in 1806. The resulting Treaty of Tilsit, in which Prussia was halved at the Elbe and also lost part of Poland, and the Treaty of Schönbrunn in 1809, following a brief Austrian uprising, left all of Europe from the English Channel to the Russian border, with the exceptions of Portugal, Sweden, Sardinia, and Sicily, either part of the French Empire, under the control of France, or allied to France by treaty.

In 1806, in an attempt to use French control of continental ports to blockade Britain indirectly, Napoleon issued the Berlin Decree, by which ships passing to French-controlled ports after calling at British ports were liable to seizure. The Continental System, as this policy was called, was not successful. The general inhibition of European trade that ensued (for Britain responded with a like policy of detaining ships bound for French ports) and the perceived favoritism in the French government's granting of licenses to French merchants for trade with Britain cost Napoleon considerable political support. Meanwhile, though pressed at home, the British were able to expand their colonial markets so as to emerge from the trade war more prosperous than before.

Napoleon's military successes resulted from a strategy of moving armies rapidly and striking quickly, sometimes by surprise, often so as to prevent the coordination of the forces opposing him, which he was then able to defeat piecemeal. This strategy necessitated a thorough knowledge of the terrain of the theatre of war, especially as quick movement precluded adequate supplying of his armies without a large amount of requisitioning in the area of operations. The answer to this strategy for Napoleon's enemies was to maintain a threat while avoiding engagements until coordination could be achieved; relying on strong lines of supply, allied armies could await opportunity while Napoleon's troops, chasing them, began to suffer from overextension of their supply lines. This strategy was used first in the Peninsular Campaign of 1811 by the Duke of Wellington, who was able to open up Spain using supply lines through Portugal. It was used most dramatically by the Russian generals M.B. Barclay de Tolly and P.I. Bagration in their response to Napoleon's invasion of Russia in 1812; they simply withdrew along parallel lines. Unable to win a decisive victory at Borodino on September 7, the only full-scale engagement of the campaign, Napoleon was eventually forced to retreat. The Russian armies then turned to pursuit; Napoleon was forced to march his army back along the same route he had come, now depleted of forage, through the Russian winter in which temperatures reached -30°F (-35°C). In this disastrous campaign, Napoleon lost 500,000 men, the faith of his allies, and the awe of his enemies.

A new coalition, formed in 1813, mustered armies that at last outnumbered those of France. Napoleon's allies fell away one by one, and by late 1813 he had been forced to withdraw west of the Rhine. An invasion of

France commenced early in 1814; Paris was reached in March, and on April 6 Napoleon abdicated. His exile to the island of Elba lasted less than a year, however, and in March 1815 he returned to France and rallied a new army. A seventh and final coalition of Great Britain, Russia, Prussia, and Austria opposed him. The campaign was brief. Napoleon's final defeat, at Waterloo on June 16–18, 1815, was again decided upon the issue of his inability to surprise and to prevent the joining up of two armies invading France along separate lines, in this case Wellington's Dutch and English troops and Gebhard Leberecht von Blücher's Prussians. Napoleon abdicated on June 22, and the Bourbon monarchy was restored in the person of Louis XVIII shortly thereafter.

French Shore, part of the coast of Newfoundland where French fishermen were allowed to fish and to dry their catch after France gave up all other claims to the island in 1713; previously, Newfoundland had been claimed by France although occupied by England. As defined by the Treaty of Paris (1763), the French Shore extended westward around the island from Cape St. John in the north to Cape Ray in the southwest.

In the 1880s Newfoundland began to develop a lobster fishery, and factories were built on the French Shore. France claimed that this activity interfered with its treaty rights and lodged a protest in 1886. In 1887 a French warship destroyed property at Port Saunders and in 1889 at Meagher's Cove. In 1888 Newfoundland protested against the interference of the French and against the construction of French lobster factories.

France and Great Britain worked out a *modus vivendi* in 1889, giving each lobster packer a specified strip of coast under the control of British and French commodores, but Newfoundland refused to recognize the agreement. Finally, on April 8, 1904, France sold its claims for 1,375,000 francs.

French Southern and Antarctic Lands: see Terres Australes et Antarctiques Françaises.

French State: see Vichy France.

French Union, FRENCH UNION FRANÇAISE, a political entity created by the constitution of 1946 of the Fourth French Republic. It replaced the French colonial empire with a semifederal entity that absorbed the colonies (overseas *départements* and territories) and gave former protectorates a limited local autonomy with some voice in decision making in Paris. By the constitution of 1958 it was replaced by La Communauté (see French Community).

French West Africa, FRENCH AFRIQUE OCCIDENTALE FRANÇAISE (AOF), administrative grouping under French rule from 1895 until 1958 of the former French territories of West Africa: Senegal, French Guinea, the Ivory Coast, and the French Sudan, to which Dahomey was added in 1899. Certain territories of the Sudan were grouped together under the name Senegambia and Niger (Sénégal-Niger; 1903), which was transformed into Upper Senegal and Niger (Haut-Sénégal-Niger; 1904). At the same time, Mauritania (Maurétanie) was added to French West Africa. The colony of Upper Volta (Haute-Volta), founded in 1909 and attached in 1932 to the Ivory Coast, was reestablished as a territory of the federation in 1947. Upper Senegal and Niger was renamed the French Sudan in 1920. By 1960 the formerly colonial territories had become independent republics, with French Sudan changing its name to Mali. Upper Volta was renamed Burkina Faso in 1984.

Freneau, Philip, in full PHILIP MORIN FRENEAU (b. Jan. 2, 1752, New York, N.Y. [U.S.]—d. Dec. 18, 1832, Monmouth county, N.J., U.S.), American poet, essayist, and editor, known as the "poet of the American Revolution."

After graduating from Princeton University in 1771, Freneau taught school and studied for the ministry until the outbreak of the American Revolution, when he began to write vitriolic satire against the British and Tories. Not until his return from two years in the Caribbean islands, where he produced two of his most ambitious poems, "The Beauties of Santa Cruz" and "The House of Night," did he become an active participant in the war, joining the New Jersey militia in 1778 and sailing through the British blockade as a privateer to the West Indies. Captured and imprisoned by the British in 1780, Freneau wrote in verse bitterly, on his release, *The British Prison-Ship* (1781).

During the next several years he contributed to the *Freeman's Journal* in Philadelphia. Freneau became a sea captain until 1790, when he again entered partisan journalism, ultimately as editor from 1791 to 1793 of the strongly Republican *National Gazette* in Philadelphia. Freneau alternated quiet periods at sea with periods of active newspaper work, until he retired early in the 19th century to his farm in Monmouth county.

Well schooled in the classics and in the Neoclassical English poetry of the period, Freneau strove for a fresh idiom that would be unmistakably American, but, except in a few poems, he failed to achieve it.

Frenssen, Gustav (b. Oct. 19, 1863, Barlt, Holstein [Germany]—d. April 11, 1945, Barlt, Ger.), novelist who was the foremost exponent of *Heimatkunst* (regionalism) in German fiction.

Frenssen, 1933

By courtesy of the Staatsbibliothek, Berlin

Frenssen studied theology and spent 10 years as a Lutheran pastor. His critical attitude toward orthodoxy, however, which later developed into a total rejection of Christianity, together with the resounding success of his third novel, *Jörn Uhl* (1901), led him to resign his pastorate and devote all his time to writing. Although Frenssen at times made liberal concessions to the popular taste of the moment, he owed his success, in large part, to the vitality of his characters and the charm and beauty he lent to the locale of his novels—the shores of the North Sea.

About half of Frenssen's novels were translated into English. Among them are: *Die drei Getreuen* (1898; *The Three Comrades*); *Jörn Uhl* (1901); *Hilligenlei* (1905; *Holyland*); *Peter Moors Fahrt nach Südwest* (1907; *Peter Moor's Journey to Southwest Africa*); *Klaus Heinrich Baas* (1909); *Der Pastor von Poggsee* (1921; *The Pastor of Poggsee*); and the autobiographical *Otto Babendiek* (1926; abridged, *The Anvil*).
